August 27th item "H. L. Doherty & Co. contribution $160.00", that would show on their bill to us from which that voucher was made, I take it Doherty donated that much as a contribution to one of the National Associations and we paid it, the bills sent by Doherty to us would explain it, or the correspondence. Our Board of Directors does not always authorize these expenditures, some they have through their executive committee. I think Mr. Doherty, Mr. Freaueff and myself were that committee, I don't know who is now. I passed on this item of H. L. Doherty & Co. contribution, I would have to see the bill and voucher to tell what it was.

875 August 31st item "Denver Omnibus Co. service $2.40", that was an expense incurred for getting Ross Phillips from the hotel to the station when he was taken sick; it was charged to us and we paid it by check and voucher.

August 1912 item "The Gas Industry $2.00" that is a subscription to a trade journal.

August 1912 item "Joers Motor Co. auto hire, $11.20" that is for the expense of an automobile.

August 1912 "Lincoln Sanitarium R. E. Phillips $13.56" we paid his bill at the Sanitarium when he came back from Denver.

August 1912 item "Nebraska Prison Association, donation $8.00", that is a donation to that association, I think a part of the $10.00 contribution.

Same date "Progressive Age subscription $2.40" that is a subscription to a trade journal. The Progressive Age is a gas journal gotten out monthly.

September 20th, "Treasurer German Day Committee, donation, $40.00", that was a donation or subscription to the German Day Committee, and has the same relation to the manufacture of gas as many other items of that sort, that we pay by virtue of our being here in business; we are practically compelled to donate to things of that character, public movements, supported by business men and individuals.

The item "American Gas Institute, dues, $10.00" I think that is for my dues in the American Gas Institute.

October 28th "City Mission Treasurer, subscription $40.00", That is a subscription to the City Mission located on South Ninth Street, I don't remember the number.

October 31, "H. L. Doherty & Co. traveling expense New York, $80.00", that was probably a part of the expense of the auditor.

Same date "Chapin Bros., flowers, $8.00", that might have been purchased to decorate the office for some purpose or other.

Same date "Harvard University, D. Wyman Public Service
876 Company, $3.46", I don't think that is properly charged; I think that is a book we purchased written by that man on some gas subject.

Same date, "Havelock Commercial Club, subscription $4.00", that subscription was not necessarily towards the promotion of a friendly feeling towards the Gas Company in Havelock, it is a donation usually among the business men towards an organization of that sort; we sometimes go outside of the City of Lincoln to make donations, we helped the gas business in University Place too by virtue thereof and helped the business in Lincoln because of its increased out-put.

November 11, "W. T. Barstow, secretary, donation $80.00", I think that was a donation to the private school of Witten-Carlisle School; that was another popular thing to subscribe to, I think we got a bond or share of stock something of that kind, but whenever we got anything of that sort with a donation we never felt that we should carry that as of any value, we put it in the books as a $1.00 and charge it off to expense.

November 30, Lincoln Gas & Electric Light Company contingent $168.91 that is some contingent items that would be shown by the books and records of the company.

Same date "Sanitary Fruit Store, cigars $2.40." I don't know where they went.

December 31, 1912, "The Gas Record, advertising $2.00" I think that was a subscription to another trade journal.

Same date "The Lincoln Herald, advertising $1.60" I think that covered the publication of our indebtedness, etc., as required by law each year, our annual corporation publication.

Same date "Nebraska Manufacturers' Association, subscription and dues $20.00", that is an association of manufacturing companies; we went into that because of our tar product.

"The National Commercial Gas Association, subscription and dues $12.00", that is the same item that appeared early in this account.

877 "Sanitary Fruit Store cigars $8.00", I don't know where they went. These items I have testified about in 1912 if taken off correctly, are charged in the totals contained in item #1503 in the operating report found in exhibit "30" covering the operating expenses of the company for that year. I heard the testimony of Mr. Thomas that these accounts were taken off the company's Accounts Payable Ledger, if so they would be a part of the operating expenses for that year and appear in our annual and monthly reports.

January 1911 "transfer voucher #1059 Dollar Gas Agreement expense $126.62", that had something to do with the agreement we were trying to accomplish in this Dollar Gas Case, I think that was an expense in connection with the special election to settle this case. This charge of $126.62 is simply one of the charge- made in distributing this expense over a certain period in our account, that wasn't on account of the election, that was on account of the individual settlement we were trying to make with our customers. The election expense was for a different sort of a settlement attempted. That was where we tried to compromise on the basis of rebating the difference between the $1.00 and $1.20 rate back to December 1910, and giving dollar gas from that time on, we made an effort to get 75% of our customers to sign an agreement on that sort of a basis. Dollar gas was to go into effect in December 1910, after about a thirty day effort we got about sixty and some odd per cent.

January 1911 "transfer voucher #1059 traveling expense Armstrong $45.48", I think Mr. Armstrong was in New York to confer with our people in regard to the compromise we proposed, in connection with the settlement of this matter. That settlement I am speaking of now in connection with that expense was the proposition our company was making to the city on account of the dollar gas rate to comply with the ordinance, to begin in December

878 1910 in consideration of the agreement being signed by 75% of the gas consumers waiving this extra 20 cents we had been collecting since this injunction suit commenced, that had accrued from the passage of the ordinance up to December 1910. Had we gotten the 75% of the consumers to sign that agreement we would have put the dollar gas rate into effect December 1st 1910. That expense was incurred largely for clerical work and classifying

our customers so we could get after them, our difficulty was to get at a system to keep accurate records as to what they said, when we were to see them again, etc. Had we gotten that waiver signed by 75% of our consumers, we would have given to them this confiscatory rate on December first 1910 and it would have been there ever since and it would have eliminated the possibility of ever having to pay for the difference between the $1.00 and the $1.20 rates between January 1st 1906 and January 1st 1911. That was during the time when the decision stood against us and we were up against the proposition of a confiscatory rate.

Referring to Exhibit "323" of February 1911 item "transfer voucher #1096, dollar gas agreement expenses $126.62," that is the same item shown in January for that year, and represents the monthly charge off for that account.

Same month "transfer voucher #1098, traveling expenses of Schuff to Chicago Convention $8.00," I don't know how that comes to be only $8.00 it is probably only a portion of the expense and the portion charged to this account. I don't know what convention that would be, it might have been the American Gas Institute, the National Gas Association or the National Electric Light Association.

Same month, "Lincoln Gas & Electric Light Co. rebates amounting to $140.64," I wouldn't know what that was without seeing the slips; they are rebates that show on the Accounts Payable Ledger that are carried into the operating reports and are so shown here.
879 Whether this is the item of rebates for gas and electricity furnished persons free of charge I wouldn't know without seeing those slips; the rebates and allowance in the gas department ordinarily cover just the gas items.

March 1911 "Charity Organization, donation, $20.00," I think that is the annual donation to the Charity Organization charged to this department.

Same month, "transfer voucher # 1111 for $21.33," I wouldn't know what that was without seeing the voucher. If it appears a number of times in this account it represents an expense that was being charged off monthly.

Same month, "transfer voucher #1111 special strike expense $20.35," that was an item of expense we had incident to a strike in the electrical department, I don't know why that item of expense shows here, I would have to have further information on that.

We had a strike in the gas department, I wouldn't say whether in 1911, our stokers all went out at one time, but it doesn't seem to me that was the date. I don't remember of any serious strike except in the electric department, I would have to see the transfer voucher to know why that was put into this account. I presume wherever that item, "Special strike expense $20.35," appears in this account it represents the same expenditure.

May 1911, "C. Kennedy, Cafe, voucher # 1213, Raymer, beer $24.00, cocktails $6.00, waitor $10.00, total $32.00, as to what connection that item had with the manufacture of gas for Lincoln I haven't any information about it; I think that was an occur-ance

that took place while I was away, I questioned Mr. Kennedy about that.

May 1911, "H. L. Doherty & Co. Inc. expense $5.60"? the only explanation I have for that, Doherty & Co. from time to time charged us for telegrams they sent us and charged back to us, relating to matters pertaining to the company here.

July 1911 "The True Voice, donation $10.00," I think that
880 is a religious publication and coertion to a certain extent was our reason for making that donation.

Same month, "transfer voucher # 1245 B. C. Adams, incidental expense to Denver $11.40," and on the same voucher "B. C. Adams traveling expense to Denver $8.55," I went out to Denver some time in 1911, I think to get some new business information; they were having a meeting there of the commercial departments in Colorado, I went out there to listen to their discussions.

"Lincoln Gas & Electric Light Co. contingent, voucher # 10723 B. C. Adams, trip to Fairbury $5.82," Mr. C. H. Freaueff came through here on his way to Denver and I rode to Fairbury with him and discussed this dollar gas case.

In the same item "Schuff expenses to Omaha Ad Club $8.00," Mr. Schuff went over to Omaha with the Ad Club, not on a forced trip specially but a number of business men went from here, various business concerns were represented largely, I saved $8.00 by not going myself.

August 1911 "Savoy Hotel Cafe $82.68," and "Lincoln Hotel Cafe $80.80" I don't think that was the regular department head dinners, I don't know whether it was some special event I would have to see the vouchers for that, I would have to make the same answer that I have made heretofore that it is one of the expenses paid in a general way.

September 1911, "B. C. Adams, expenses to New York, $152.00," that trip was in connection with the companies affairs, just what at that time I can't say. It was necessary for me from time to time to confer with the Eastern Office, and either I have gone down there or they have come down here, whenever Mr. Freaueff or Mr. Doherty have been out here nothing was charged to expense, I don't know who has paid it. I wouldn't say it was an expense made necessary by having the Eastern Office. Whether there have been but two things connected with this case that necessitated that,—one this dollar gas case and the other the issue of our stocks, bonds, and notes,—I wouldn't limit it to those two things; I have made trips for
881 the purpose of discussing the character and kind of apparatus we were to buy here for manufacturing purposes, to confer with them with reference to the distribution system in regard to changes of importance for improvements, of course, I don't deny that most of the trips we have made in the last two years were made in connection with this case. I don't know whether this trip was made in connection with the distribution system or for the purchase of any apparatus. As to whether our changes in the distribution system were made in 1910 and for the last large piece of construction, no in 1912 the gas holder. The East Lincoln Gas holder was

constructed and put in operation in 1912 or 1911. Our first expense was charged to that holder in December 1909. I wouldn't say that all questions to be discussed with the New York office with reference to the purchase of apparatus or changes in the distribution system were settled by that time. We have purchased nothing of any considerable importance since that time except water gas sets. The policy of putting in water gas sets, and supplying Havelock and University Place wasn't definitely decided at the time we put in the East Lincoln holder. I will ascertain whether this item is properly chargeable to the manufacture of gas, or whether connected with this litigation, or incident to the issue, stocks, bonds, or notes.

September 1911, "J. D. M. Buckner, donation, $8.00 that was probably a donation to the church at University Place.

October 1911, "L. Korsemeyer, donation German Day, voucher # 11185 $24.00," that evidently was a donation to the German Day Festival which they have here annually. In regard to those donation- which we are called upon to make, I have always tried as hard as I knew how to make it as small as I could get by with.

October 1911, "Lincoln Commercial Club dues, transfer voucher # 1334, $254.47," I have no means of knowing what that represents without looking up the voucher.

882 In November the three items, "transfer vouchers # 1343, and 1344 for $10.40; $50.00 and $26.00 respectively," I don't know what they are without making further examination of the records.

The next item, "Crawford Kennedy, Cafe, voucher # 11270, dinner to Harry Lindsay $25.00 and extended $20.00 and charged to gas," I remember that incident, there was a dinner given by men from all over the state to Harry Lindsay the Clerk of the Supreme Court and several of our fellows were invited to that dinner, I agreed to pay for their dinners and Crawford Kennedy took care of it, we didn't give the dinner to Harry Lindsay. Mr. Lindsay knew nothing of this charge, and I suppose they thought our men were paying for their own tickets; on that point, whenever an incident of that sort occurred I always felt that the company itself ought to pay for the men's tickets that attended, that meant such as were employees of the company, I never felt that we were paying them enough to warrent them spending the money out of their own pockets. No it was not a contribution made to a dinner gotten up by local men while he was clerk of the Supreme Court and we gave that much from our general expenses, as I remember we paid so much for each man that attended that dinner, I don't remember the price, but say it was $5.00, I attended, Crawford Kennedy, Max Begtol, and E. C. Strode attended, I think we paid for their tickets,—well I don't know as we paid for Mr. Strode's ticket,—I think we paid for Max Begtol's, but we didn't give any dinner to Harry Lindsay and didn't have anything to do with it.

December 1911, "H. L. Doherty & Co., expenses and services, W. H. Gardner, $33.23," that was probably for some work done by Mr. W. H. Gardner who is the head of the statistical department. The

statistics were made up at that time for Doherty & Co. and in time for this company, or for other companies, of course it was for some other companies, it wasn't all charged to us. These statistics
883 might be directly made of Henry L. Doherty & Co. for the direct benefit of the Lincoln Gas & Electric Light Company.

The next item D. G. & E. Co. expenses L. A. Ramsey and M. L. Derge, $40.00," I think that was a part of Mr. Ramsey's expenses coming here from Denver, we took him into the office, he had been an employee of the company; I can't think for the moment what Mr. Derge's connection with that item might be.

January 1907 "F. J. Rehleander rebates & allowances, voucher # 2616, G. & E. furnished to S. H. B., H. H., C. O. W., $67.80," that looks as if it was the amount of gas and electricity furnished to S. H. Burnham, Homer Honeywell, and C. O. Whedon, with Rehleander's name attached to them, I suppose he signed arbit-arily the rebate slips and put them through the cash drawer covering the amounts shown as being charged off for Burnham, Honeywell and Whedon. I expect Mr. Rehleander's name is the only name that would appear on the rebate and allowance account covering those items. To ascertain what the item represents it is necessary to go to the voucher, I would say that wherever these items appear in this account it is the same character of items.

February 1907, "H. G. Clements donation $50.00," I was superintendent in 1907 and had but little to do with the accounts, I take it that was a donation to the Fire Department; I think it was done because of the aid rendered the company in a fire we had at the plant, I remember at that time we did give the Department something for the beneficial work they preformed during the fire.

Whereever the word "donation" appears after any item in this incidental expense account it means that we contributed a certain amount to such person or organization, and that it was an expense incurred by not only ourselves but other business men in town, while we have received at times, stock certificates which we have not considered of being of any value for the expenditure except in that manner.

884 February, 1907, "Emerson, MacMillen Company, voucher #3051 S. C. Appleck and postage $10.17", I don't know what that is.

Wherever the item H. Honeywell incidental expenses appears I don't believe he was given a monthly allowance, I believe he charged in his expenses at whatever they were; My recollection is he wasn't given a stipulated amount but I think he was allowed all of his expenses, possibly just toward the end of his administration he was given a monthly allowance. Where there is no month connected with the item I would take it to represent the expenses he asked the company to pay at that time. As to the nature of those expenses, I don't know just what to say to that, they were the expenses he incurred around town by virtue of his being manager of the company. I presume similiar to the expenses incurred by me while manager; mine were various items for entertaining people, I don't know as I should say entertaining but extending hospitality

to people who came into the office and I invited them to lunch and I always paid for it out of my incidental expense account.

April, 1907, "B. C. Adams expenses to Chicago, $22.50", I went to Chicago to meet Mr. Scott, and conferred with him in regard to the purchase of additional equipment for both gas and electrical departments. I don't know what division was made of this item between the gas & electrical departments. Mr. Scott is and was the general manager of the Doherty Operating Company.

April, 1907, "transfer voucher #366, $125.00", I wouldn't know what that was without examining the voucher.

May, 1907, "H. Honeywell, expense voucher #3072 expenses for May $80.00, M. B. M. $25.00, O. D. H. $25.00, C. C. J. $25.00, A. T. Large $100.00, making a total of $255.00", I don't know and never knew what that was; I don't know whether the voucher shows it or not. I don't think I know any of the parties
885 whose initials appear there, I never heard of A. T. Large, I don't know as that means so much money spent at large, those were expenses that I wouldn't know anything about. Mr. Honeywell would probably know about that. That was at the time I was superintendent, I had nothing to do with this department of the company then.

Wherever the item Lindell Hotel expenses incurred occures in this account whether that represents the same sort of a- expense as the Savoy Hotel Cafe, I think at that time Mr. Honeywell charge- in his cafe expenses as they occurred; I don't know as he had any regular meetings of the department heads or anything of that sort. I wouldn't know, concerning the nature of expense which appear as Lindell Hotel expenses with an amount after it, I could only make a guess at it, that was before I had anything to do with the management of the company.

November, 1907, "H. Honeywell expenses, including voucher #3846 $100.00 total $125.00", I notice the last item was commission on Gardner & Greeley notes. That is separate from the first two items. I only know what the first two items were from what I gather from the reading. If it is the Greeley I think it is he was a man that worked for the company and had some money to invest, I don't know the nature of the transaction, I believe in 1907 we were selling $100,000.00 of one year or two year notes, and I believe those selling the notes were allowed 2% commission, and that commission charged in the operating expenses of the company, I presume.

November, 1907, "L. G. & E. L. Co., voucher #3883 commission paid to C. R. Wigart on two year notes $20.00", I would say that was a similar item to the last one.

March, 1908, "Doherty Operating Company expenses F. W. Freaueff voucher #5507 and 5508 $81.50", I presume that was for the expense of Mr. Freaueff in visiting this company, I don't know for what purposes, I don't know anything about those expenses prior to 1909 only through my general knowledge of the business, I can't answer anything prior to 1909 from personal knowledge.

886 Wherever the item "cigars" appears throughout the account the expense represented by that was either for Christmas presents to the employees of the company or those outside; I think you will find most of those items in January. It is customary to give our employees a Christmas present but it got so expensive that we discontinued that practice, we bought several boxes of cigars and passed them around to the employees in the office, plant and street department; that also accounts for some candy items where we purchased candy and passed it around the office among the girls. I would say that item also represented the purchase of cigars that were given away one at a time and smoked by the employees of the company during business hours.

March 1909, "E. A. Brownell, copy gas decision $5.00", that is probably in connection with this suit.

April 1909, "John W. Smith $120.40; bar $7.40; cigars $8.80". I think that was for someone of the company that came through here from New York, that was in the early part of my administration, I don't remember what that was for.

May 9, 1909 "H. C. Porter expenses to Omaha $29.96, and Harry Warner expenses to Omaha $16.00", I think that was for attending the Nebraska Electrical Association down there; if that was an electrical convention I wouldn't think that a proper charge to the gas account.

May 1909, "B. C. Adams expenses to Atlantic City, voucher #6311 $320.00", I think that was the expenses of myself and Mr. Porter attending the National Electric Light Association. Whether that would be a proper expense charged to gas, I wouldn't say, only the methods of the two departments are a good deal alike and we sought some new method for getting business in the electrical department, that might also apply to the gas department, that would be the only place we could justify charging a part of that expense to gas;

887 that is only a part of the total item, divided 20% to electric and 80% to gas.

May 1909, "B. C. Adams incidental expenses and expenses to Omaha $46.00 I gues- that was my regular $40.00 allowance plus $6.00 for my trip to Omaha probably for that electrical convention. or that might have been the Iowa District Gas Association Meeting, I think it would show on the voucher.

May 1909, "Country Club membership, Warner, Bradford, and Porter, $120.00", that is their initiation fee. I was a member at that time and no one else besides these gentlemen. That is a social organization, the boys wanted to belong and I told them the company would pay their initiation fee and they pay their own expenses, that was the only time that was ever done. It was during a time of particular hardship around here, we had considerable trouble with our plant in getting into the good graces of the "Vox Populi".

May 1909, "H. L. Doherty & Co., H. H. Scott voucher #6936. H. H. Scott three days $75.00, hotel expenses $15.00; railroad fare $25.00; telegrams $12.85; total $102.28;" I wouldn't be able to state what that was for now, I don't remember; probably in connection

with the operation of the property, he was a representative of the Doherty Operating Co.

May 1909, "H. L. Doherty commission placing notes, voucher #6946 $52.00", those were the two year notes for taking care of the extension of the mains.

June 1909, "Doherty Operating Co. telegrams, voucher #6939 $13.87", those are telegrams sent and paid for by the Doherty Operating Company to this company in connection to its operation, charged to this company and finally paid by us.

June 1909, "L. G. & E. L. Co. rebates voucher #6564", ($108.96 charged off gas at 134 So. 11th) I think that was because of the campaign here through the General Gas Light Company, they opened up a store at 134 So. 11th and we furnished the gas for
888 a demonstration of gas arc lamps.

July 1909, "E. C. Strode voucher #6513 charged to H. C. Porter $49.32", I don't know what that was, I will ascertain.

August 1909, "H. L. Doherty & Co. voucher #6945 commission on $20,000.00 notes, $40.00", I presume that is a similar commission to the other paid Doherty & Co. for selling the notes.

October 1909, "William Bradford, expense to Detroit, Voucher #7134 $58.80", I think that that was to attend the American Gas Institute Convention.

December 1, 1909, "C. W. Gleason loss of clothes at Fremont, $7.28", we sent him over to help that company out at one time and while at the plant somebody stole all of his clothes out of his room and when he came back he insisted that somebody should take care of it, we took care of it; it is properly charged as a Fremont item.

December 1909, "selling electricities subscription $4.80", I doubt if that should be charged 80% to gas and 20% to electricity.

January 1910, "Will H. Green painting club room floor $9.60", that was for painting the room occupied by our solicitors where they had their desks and morning meetings, that might be a new business item. At that time an effort was made to convert that into a club room for the use of the employees, we had magazines and papers for them there, wherever any item appears under the heading, "club room" it pertains to that same club; also wherever the expense of selling electricity appears it is the same item already mentioned. Also the item of the Electrical Review Publishing Company subscription $2.40 that is a similar charge.

March 1910, "Roy McKinney rent of piano $3.20", that was a piano used in the club.

March 1910, "Kennedy trip to St. Joe and return $20.00", that was made in connection with that strike that we had in the electric department I think, if so it should not be charged to gas, I
889 should have to see the voucher on that.

March 1910, "Hammond (Lyman) $8.00, also tickets signed by Backster for Clark $2.00", that probably should have been charged to the electrical department. I don't know whether that is true of all of these items aggregating $60.60 in voucher #7821.

April 1910, "Nebraska Electric Association dues 1909, $20.00 I

think that should be charged to the electric department in a matter of this sort.

April 1910 "Doherty Operating Company, expenses H. H. Scott for December $32.00", that was probably some work Mr. Scott did for this company, he came here has a representative of the Doherty Operating Company.

The item "G. R. Wolfe & Co. $1.40", that undoubtedly means cigars.

June 1910, "Country Club Bradford and Warner $56.00", that was their dues, Mr. Bradfort was superintendent of the company at that time.

"Transfer Voucher #934 B. C. Adams expenses to St. Louis, (Adams vouchers 8353 and 8404) $27.44", that was for my attendance at the National Electric Association at St. Louis, that only dealt with gas in a general way.

July 1910, "transfer voucher #950 Honeywell (Adams $30.00 appearing months of July 1910 to December 1910 cover charge in account #1936, etc., see voucher #5710 H. Honeywell, O. K.'d by H. L. D.) $30.00", my recollection of that item is it was an expense that stood on the books against Homer Honeywell which he had incurred as incidental expenses and I recommended that it be charged off.

July 1910 "National Electric Light Association dues, Adams Bradford & Warner $12.00", that had to do with gas only in a general way.

890 August 1910 "Glenn Marston expense $40.00", he was a man who made a very exhaustive study of municipal plants and their operation and came through here in August 1910 and made a study of Municipal Lighting and Water Plants of the City and reported to us, we were getting information as to how they operated with economies of operation, having to do with gas only in a general way, having nothing to do with the manufacturing department but does have to do with the management and operation in a general way.

May 1912, on page 19 of exhibit "J. E. Schuff expenses District Gas Association $239.10", that was in connection with holding the Iowa District Gas Association here, we didn't pay all the expenses incurred here at that time this was a contribution. As to whether the item included hotel bills or hall rent, I don't believe we paid any of the room rent. I wouldn't be surprised if that was a part of the expense of the prize fight they pulled off at the Beach for the benefit of the common people and the City Council.

The Petrosote Manufacturing Company is a Hypothetical Company under which we have been selling our tar as Petrosote, we found it easier to sell it as Petrosote than as tar, there is a common prejudice against tar which furnishes a large use as a preservative and we discovered we could sell more tar by not using our name, if we sold it under the name of the Lincoln Gas Company people would think at once that it was tar so we sold it under the name of the Petrosote Manufacturing Company and have built up a business that is now taking care of our,—well practically our entire out-put of tar, built

up under the name of the Petrosote Manufacturing Company. There is no such organization, only among our boys. No separate set of books is kept for that, all their accounts are entered in the Gas Company's books. That is just a business name and I make that explanation for using that name as a sale company be-
891 cause we produce such wonderful results selling it that way and deceiving no one, we have even sold that to the government for preserving their posts on their reservation around Valentine, we have explained to everyone just what the product was. It is just tar, but we can't sell anything under the name of just tar. Most people look upon tar as a coal gas tar very thick and hard, but really the tar we are selling is water gas tar, a very light oil and not heavy at all. It is used for dipping shingles, painting iron work, hog wallows, and hen coops. We sell it for $10.50 a barrel. If there are any profits the receipts all go into the gas receipts. There is no separate account kept with the Petrosote Manufacturing Company and the expenses of that department are shown in our tar residuals. We enter it in our books as tar sold not as Petrosote.

Numerous items entered each month for telegrams in the various accounts are not always for telegrams sent to or received from the New York office, the telegrams are sent for various purposes, to find out whether coal oil or coke shipments have or have not been made, where various materials may be en route to Lincoln and correspondence in that way has been carried on to a large extent with the manufacturers at various times. Wherever the name of Doherty & Co. or H. L. Doherty is used in connection with the telegrams it would be from them.

Exhibit "326" as charged in account #1507 for the year 1912 $19,696.64 under the heading "Promoting new business, gas", represents the amount of money used for what we call our new business expense for the year 1912. We have a similar item for the electrical department. I don't remember what that amounted to for 1912. The division of that expense was 80% to gas and 20% to electricity, the division has been arbitrary largely. Whether the gas depart-
ment has no competition and the electric department has, I
892 wouldn't say that, there is no other gas sold in Lincoln but the electric department comes in competition with the Traction Company in the commercial lighting field and for power, I think for that reason we have made a particular effort to sell gas, perhaps the larger portion of our expenses should have been charged to gas at various times, because our effort was directed in that line. I think that is proven by the fact that we have here about one customer, as I remember, for every 5.6 of population while the two electric companies together have but one customer to every 10 of population. A great many people who use gas do not use electricity in their houses for the reason that we have pushed that side of the business too.

We have on our books certain subdivisions of this account #1507 known as accounts #1819-*a*; 1819-*b*; 1819-*c*; 1819-*d*; 1819-*e*; 1819-*f*; 1819-*g*; 1819-*h*; and 1820 with certain letters for subdivisions. In 1819-*a* of exhibit "326" for April 1912 "Pay roll

$41.60", as to why there should be an item of pay roll under advertising which is subd-vision 1819-*a* would say, the only way a labor item could appear there was to pay some one for doing some advertising. I don't remember what that was. That item continued throughout this account would be to pay someone for doing probably newspaper advertising, to get up our advertisements for us, I don't know that is the item but it could occur in that way.

Subdivision 1819-*c* January 31, 1912 pay roll $295.01, that represents the bonus; and commissions paid to dealers on loss that occurred in selling ranges at less than cost. I take it that the items in this subdivision of this account ranging from $295.01 to $520.50 every month represent the bonus; paid to our men, I am not sure of that but our accountant could tell that better than I can. The item of December 31st 1912, in subdivision 1819-*c* of this account
$520.50 represents the same thing. In 1912 I think we had
893 seven solicitors in the new business department and others on the sales floor. Their time was divided, I think, 80% and 20%. We had a greater increase among the electric consumers than among the gas considerably. That does not indicate the greater portion of the time put on the electric business, it might indicate to the contrary, in trying to keep the gas consumers, very nearly all of those that came over to us as electric customers have been gas consumers previously, the company is in active competition with the Lincoln Light, Heat & Power Company in the lighting field, we made every effort to keep every customer of gas illumination and if he went to using electricity we then stood an even break to get him. Our men in the new business department are constantly competing with men from the Lincoln Traction Company in that field, in a good many instances we have pretty nearly controlled the power in all the electrical industries, we have had by far the greater proportion of the power users, and have*n* gotten them on long term contracts in many instances, in fact I myself have closed some of the biggest ones, in all of our big electric contracts we have not used our solicitors either myself or some other person not in the new business department has conducted the negotiation. The City Council has not established a rate for electricity and we have been at liberty to make a special rate on that commodity to a certain extent, and have done so to the large consumers rather than the small consumers. I wouldn't say that our solicitors have attempted to induce our customers to take our current rather than that our *our* competitors,—I wouldn't say they have done that way, we have made an effort to keep our own electric business and also get some from the Traction Company. I am simply referring to the division to refresh my judgment that we have put the biggest effort on the gas industry and I think our percentage of 80 and 20 would probably cover the division. The only active competition we have had in the past ten years has been in the
electric field and we have fought it most in the gas depart-
894 ment. We have lost customers from our gas department who have gone to electricity absolutely, I remember that R. O. Castle was one who used gas exclusively and our effort was spent to keep those men *for* using gas for illumination because they were

getting their gas for illumination and cooking cheaper than they could get electricity for. Our experience has been where a customer has gone to electricity, having been a user of gas he has increased his bill 50% in regard to the gas used when he uses electricity for illumination and gas for cooking; we have used that argument to fight the Traction Company. As a matter of fact we have increased our gas consumers and the large gas consumers have used more gas, and last year increased over the year before, I think our reports will show that. It showed that the last time I looked up our reports. It is not true that our sales of gas in 1912 increased per consumer over any previous year, I think the reverse is true. I think the sales per consumer have decreased, if they have increased it wasn't because of selling the resident users more gas, it is because of the larger business we have gotten down town which has cost us a lot of money to get in by way of solicitation.

January 1912, in account 1819-*a* "A. G. Osmer, rent of roof $4.00", that is for one of *the* those roofs for advertising purposes, for an electric sign, I doubt if the word "gas" appears on it.

In this account appears the names of practically all the newspapers published in the City of Lincoln both daily and weekly for varying amounts paid for advertising. The proportion of space used in these advertisement- between gas and electric departments, I think in 1912 there was a much larger percentage of space used for gas than for electricity, at one time we gave an order to advertise nothing in the electric department and advertise only the gas department, to what extent that was carried out I can't say off hand. I wouldn't say there was a great deal of advertising for the sale of appliances for both gas and electricity; I don't know just what proportion there would be of inches of advertising space to each but I do know we gave a
895 blanket order to advertise absolutely nothing but gas. That order was given about 1911. I don't know how long it was enforced.

We did a lot of advertising in 1912 whether the advertising charged into this account particularly for the months of November and December 1912 was in connection with this attempted compromise of this law suit, I would have to look up and see how the division was made and will do so. We published whole page and half page advertisements concerning this settlement in the daily newspapers and I guess also in the weekly newspapers.

Whether most of our advertisements are for the sale of appliances and not for our product, that is a technical*lity*, we may have advertised our appliances to get them installed so we could sell our product.

Exhibit "333" is a newspaper clipping from the Lincoln Herald reading, "Get a gas range. Visit our Modern office and sales room. Lincoln Gas & Electric Light Co., Bell 75 Auto B2575". This isn't a fair sample of most of our advertising; I haven't any objection at all to it but I presumed you meant that if this was an advertisement such as we ordinarily run and I wouldn't say that. As to what kind of an order the company gave this paper when it reserved the space. very often we furnished the copy and where we failed to do that they were told to use some previous copy furnished them. A man might

get a gas range without consulting the Herald. That might hold true in all papers as far as that goes.

Exhibit "333" offered and received in evidence.

I didn't say that gas ranges and appliances quite generally are sold by the hardware dealers in this city, I didn't say it in that way but they do sell them as well as we do, we sell them more than anyone else. I consider the gas range business part of the public service business. Whether the city could regulate the price of gas ranges is a matter outside of the sale of the gas itself. Whether we lost
896 over $7,000.00 on gas appliances in 1912 as shown in our report, and run that loss in the operating expenses; I can't answer that without qualification, I would put it this way; we have certain expenses in this company that we designate as new business that we would have in any event whether we had a new business department and that we would have even though we didn't sell gas ranges or any other gas appliances, so I wouldn't say that loss was incurred by virtue of our selling gas appliances. In our 1912 report is entered as one of the operating expenses an item headed "loss in gas appliances $7,000.00".

In subdivision 1819-c of this exhibit "Domestic Fuel Appliances and connections, salaries," and in the month of January 1912 "L. Westermann, car fare and meals $6.96", you will find that item right along there for a considerable period, it covers Mr. Westermann's car fare to and from University Place and his own meals out there, we found that amount consistent, and we would rather pay that expense than to pay it as salary, we sent him from this office to University Place and his expenses were increased and to make him satisfied we either had to raise his wages or pay his expenses. University Place is a suburb outside of Lincoln. This exhibit is our new business account charged up for operating expenses here in Lincoln. Any expense we had in University Place and Havelock in promoting new business, we charged as a part of our new business expenses here, provided they was in the new business line. That University Place and Havelock expense for new business can be ascertained by segregating Mr. Westermann's salary and the amount we paid solicitors during the time they solicited. We could only make an estimate to arrive at that in any other way, I don't believe we could tell exactly. We have had an electric business in Havelock a year or two. That does not come within this same department of the extension of the business there. It is carried as a separate company known as the Havelock Electric Light Company. The net results are reflected in Havelock, the expenses are distinct in every respect unless we have made some error in our accounting. We purchased the new company and held
897 stock in the old company in Havelock. That investment is separate and distinct, the items of expense are not in our items of expense here.

Subdivision #1819-*d* of this exhibit is entitled "Domestic fuel and appliances and connections—exhibition expenses," months proportion of rent and heat account; the proportion of our rent and heat charged to the new business department has been determined by the aera of floor space they occupied. At this minute I do not know the

relative size of space occupied by the new business and other departments; I have known of course; they have the most available space we have in the office and that has been taken into consideration. It is the greater share of the space too. This division has been based on the floor space proposition and as between the gas and electric departments .80% and 20% and charged to the new business department. Whether I think $140.00 a month is a proper amount to be charged to the new business department as rental we pay this in building, I think that is a fair division of the rental due to the fact that they take the front part of the office, have all the window space and a large amount of floor space. I wouldn't say that but for that department we could get along without the display windows. The most available part of our floor space is occupied by the new business department. Concerning whether we have the greater portion of it in area in use for that purpose yet have not charged one third of it to that department for rental while our rental is $450.00 a month I would say yes, but we have for that $450.00 the same basement area we have on the first floor, then we have the first floor and possibly something over one-third of the second floor of this building. Whether the greater portion of the basement is used for the storage of the new business department stock, you can call it that; it is our appliances stock and the basement is used largely for storing our appliances, also to a large extent by our fitting department, which takes out and puts in meters and brings them back and does the piping, etc.

898 Exhibit "334" is an advertisement appearing in the Daily News of December 18, 1912, it is a diagram showing the curve of volumtary reduction in gas rate from 1901 to 1905, shows the rate charged during that period and what the rate would have been had the compromise been accepted that was offered in 1908. The advertisement was made in connection with the effort to settle the litigation by popular election. Had it been accepted under the terms of the settlement, among other terms, it was provided that we would refund to the customers all the difference between $1.00 and $1.20 accurring since December 1, 1910, in consideration of their waiving the difference prior to that time. This law suti was the occasion for that "ad." being run at that time.

Exhibit "334" offered and received in evidence. I *I* think that advertisement was carried in other papers, it was a part of the publicity campaign conducted at that time.

Exhibit "335" is a photograph of the front part of the office of this company, that is the sales floor. I don't know what proportion is occupied by gas and what electric appliances; the larger portion is occupied by gas appliances I would say. That is a fair representation of the room but doesn't show the gas appliances in here by any means.

Exhibit "337" is a portion of the frontage on So. 14th St. of the gas office, and represents a part of the sales floor, that is the entrance to the building, and the two sections of the windows just north of the entrance on 14th.

Exhibit "336" is a p-rt of the frontage of the sales floor of the gas

office on So. 14th St. The gas department is given the most important space in the portion of the company's windows in this exhibit. Those are not gas fixtures in the front windows, those are electric, but those front windows are less than 12 feet in width
899 and don't make a desirable display space. The space shown at the left hand side, being immediately adjacent to both sides of our west front door isn't the most conspicuous space in all of our windows, it is the corner of the building, if the entrance didn't cut up the section of the window to the corner it would be the most desirable space, but being cut up I wouldn't say it was the most desirable or conspicuous from an advertising standpoint means it must attract the passer by, and I wouldn't say it would do that as well as some other part of our building. People may see the windows there but I doubt if they see as much there as the larger windows where the display can be better and more attractively arranged.

Exhibits "335", "336" and "337" offered and received in evidence.

I expect subdivision #1819-*f* of exhibit "326" of January 15, 1912 two items of rebates aggregating $21.65 represent rebates on appliances, I don't know without seeing the rebate slips.

January 15th, 1912, "Peoples Plumbing Co. rebate on heater $3.00", that is a commission for selling a gas water heater and paid the Peoples Plumbing Co.,

February 29, 1912, "Transfer voucher #1408, proportion of bad debts, Petty Journal $60.00", is the proportion of bad debts charged on the Petty Ledger, the new business account had credit for it and when we found we couldn't collect it is reasonable to suppose we should take it away from them again. That was for appliances sold, and wherever that item appears throughout this account it represents the same character of an item.

Concerning the expense charged to advertising in the effort to make a settlement of this suit in December 1912, particularly the publication called "Christmas Offering" of which I think none appears in this account nor in any gas account, except there might be some few items, but by far the bigger percentage was
900 charged to electric advertising because we carried electric advertising in the publication during all the time it was published and we sold an enormous number of electric appliances by virtue thereof. That publication was gotten out for the purpose of giving our arguments in favor of the gas settlement. It might be a subject for an argument as to why they were published there. That was edited by Mr. Maupin. His compensation was taken care of by virtue of my signing a note with him he owed someone money and wanted an endorsement and I endorsed the note that was all. I think *we* has paid the most of that back; we were at the point of shutting Mr. Maupin off from gas and electric service and I think we charged it off as bad debts and let it go at that; we either had to shut him off or get the compensation in some other way. We didn't charge anything of Mr. Maupin's bill off after that time. February 15th 1912, "charges for bad debts old accounts as per order B. C. Adams gas $21.75 electric $36.07, total $57.82"; I expect that is correct, that is about as I remember it. I didn't say that was a payment, we had

an urgent situation where we had to shut Maupin off or pursue some method to collect that back, I had been trying to collect the account for some time, and if we hadn't taken Mr. Maupin in to help us with that publication, we would have had to charge it to bad debts anyway. Whether this account that was charged off was charged in payment for his services in that matter, you can put it that way if you like, that is the way I put it up to Maupin, it was unavoidable in any event. I think that would have been a proper charge against the operating cost for making gas; I don't think we ever sued anyone here for debts of that sort, we never found it paid.

Whether we had a man on our pay roll and charge his account off, as bad debts, to operating expense; we didn't have him on our pay roll, I don't remember that we did.

901 March 1912 in account #1819-*a* "Maupin-Shoop Publishing Company, advertising $10.88", they ran a printing office and did some printing for us, they were not employees. We were selling gas for the gas company.

May 1912, "W. M. Maupin $1.82" it doesn't say how that was paid to him. June 1912 again "Will Maupin advertising $4.80", I think that was for the printing company. July 1912 "Will Maupin $5.60", I think that was all for the printing company. August 1912, "Will Maupin $2.88" that is the same. September 1912 "Will Maupin advertising $1.92", that is the same I think. December 1912 "Will M. Maupin $2.90" I think that was for the printing Company, Maupin & Shoop.

Whether we paid him money for this special advertising done in November and December 1912 from our electric department, I don't say that we paid him; my answer was that the amount he owed would unavoidably have been charged to bad debts, I charged it to bad debts at that time and did not sue him. That enters into the operating expenses and the deductions from gross earnings, which I think was legitimate; it would be an account that we hadn't been able to collect and had done everything in our power other than to sue.

November 30, 1908, "balance range, advertising charged to W. M. Maupin, voucher #5512 $17.00", that was what he owed on a range and was charged off to bad debts.

February 21, 1908, "W. M. Maupin $10.00", paid by Mr. Honeywell, that is in 1908, I know nothing about that or about 1907.

Whether we have any other accounts of that kind charged off as bad debts against parties who owed bills, that is the only account during the time I was manager; and I still feel if I hadn't charged it at that time we would have lost the account. We did not cut off his service, he continued to use it and started to pay for it.

902 Concerning exhibit "327" and the nature of the expenditures therein beginning with January 1913, "Sloan Huddell & Company, voucher #13720 on account $2650.00 services, amount charged in this account for this month $500.00"; we employed Mr. Huddle to advise us in this gas case. Sloan & Huddle is an engineering firm having an office at Madison, Wis., Mr. Huddle was the gas expert for the Wisconsin Railway Commission. The $2650.00 was for services rendered us by Mr. Huddle and his firm.

We advised with them in regard to certain methods of proceedure; we wanted to know something about how the Wisconsin Commission handled matters of this character, and we have information, or got information from them that we have taken advantage of in conducting our side of this case. It is for expenses incurred in the prosecution of this case.

In February appears the same item, "Sloan Huddle & Co., voucher #14018 services $1650.00"; it is the same firm and covers the expenditure for the same services. I think that is a separate item from this $2650.00, I can't say without looking over the account; it seems to me that $2650.00 was the total amount, but I may be mistaken.

The two items charged as paid to H. I. Lea are in connection with this suit.

In March "H. L. Doherty, voucher #14045, Nash, Cropper, and Brodnax salaries, $303.34"; Mr. Brodnax and the oth-r two gentlemen were employed to make the inventory of this property for the purpose of this suit.

"George Bros. letterheads- stationery, $11.70", I expect probably that might have been some letterheads we got for use during the campaign on this gas proposition.

In May appears the item "Culbertson & Waite appraising property $10.00", also the item "Green & Purbaugh" appraising property $25.00"; I think that and all the other items here in this account and in connection with this suit and charged in operating
903 expenses as special legal expenses for 1913.

We changed our classification about January 1, 1913.

Exhibit "321" January 1913 "B. C. Adams, expenses B. C. A. and E. C. S. $80.00", was the expenses of Mr. Strode and myself to New York in connection with the matter of this rate case.

"Transfer voucher #1676 expenses B. C. A. and E. C. S. to New York ($575.00) $92.00"; also expenses in connection with a trip to New York on this case.

February "H. L. Doherty & Co. expenses B. C. A. to New York $80.00", and "transfer voucher #1700 B. C. A. and E. C. S. expenses to New York $92.00"; were both expenses in connection with the trip to New York on this case.

The next item "L. G. & E. E. Co. contingent $28.65", I think was some expense contingent upon the operating expenses.

Wherever the item B. C. Adams & E. C. Strode appears in this exhibit it is the same item I testified to before and is for the same sort of an expenditure.

May 1913 "J. E. Schuff expenses to Fremont $9.60", I don't — that was business for the Fremont Gas & Electric Company, I don't know what it was for.

May 1913, "Expenses J. E. Schuff Burlington, Iowa, $58.00", that was for his attendance at the Iowa District Gas Association.

The next item, "C. Kennedy expenses to Burlington, Iowa, $70.00", was for the same purpose.

July 1913, "Fred Walt, railroad fare Rotary Club to Omaha $3.52", that was to attend a meeting there.

The remaining five items "B. C. Adams and E. C. Strode to New York $175.00) $28.00", represents expenses to New York on the dollar gas case.

Exhibit "322" is the general office expense account $1502-*a*. Concerning what the expenses set out there are for, the old classification says : "(a) Charge with all books and blanks for general office. unless otherwise specified, desk supplies, rubber stamps and
904 pads required for use in general office". I think that was the expense for moving into this building.

Exhibit "330" being a copy of the general office incidentaly expense account for 1913 the item "W. H. England donations $20.00", is a portion of a donation for the purpose of conducting Sunday meetings at the Oliver, and later at the Lyric Theater.

January 21, 1913, "Henry L. Doherty & Co. New York draft $6.00", was for procurring a draft to send interest money or make a deposit there. Where the items of dues, candy, cigars, and flowers, appear in this account, to a certain extent, are the same sort of expenditures designated in exhibit "323"; in this month of January most of these things were for Christmas in lieu of giving presents they are donations of that character.

January 31, 1913, "National Electric Light Association dues, voucher #14495 $36.00", was a portion of the company's dues in the National Association, and only in a general way concerned the manufacture of gas.

January 31, 1913, "Lincoln Gas & Electric Light Company contingent $28.94", I wouldn't know what that was without seeing the items.

February 21, 1913, "J. E. Schuff gas election voucher #14626 $10.50", an expense incurred by Mr. Schuff during the gas election of 1912, in an effort to settle this litigation.

The three items "Western Union Telegram Company voucher #14624 $11.33; Henry L. Doherty & Co. telegrams $7.55; and Postal Telegraph Company voucher #14639 $7.25", I don't know now what they are for, probably some were in connection with this effort to settle this suit, I don't know that most of them were, that was after the election.

The item "Elks Club Cafe, voucher #14566 $5.80", represents cafe services over there.

March 17th, "State Journal Co., R. W. Gilbert Journal & News, voucher #14780 $10.16", I guess that was the proportion of our daily subscription for the company to those papers; Gilbert
905 was probably paid as a Journal collector.

The item "rebates" in this account are the same sort of items as the "rebates" in exhibit "323". Where the items "contingent" appear they represent adjustments made of accounts or something of that sort; they might contain rebates covering free service, I wouldn't say just what was in those accounts.

June 30th 1913, "Elks Club Cafe, meals, voucher #15351 $7.04", those are for meals at the Elk's Club furnished employees of the company. The employees of the company are not necessarily members of the Elks Club.

July 28, 1913, "H. L. Doherty & Co. exchange on draft, $4.00 and $2.40"; that was to make a deposit in Doherty & Co.'s bank to the credit of this company, and was used for the purpose of conducting the business of the Lincoln Gas Company.

July 31, 1913, "Freaueff & Robinson, telegrams and stenographer, voucher #15508 $14.86, that covered an expense caused by the dollar gas case.

August 15th 1913, "Lindell Hotel, banquet, voucher #15595 $49.65"; I don't know what that is for, my supposition would be it was given in the spirit of gladness in seeing my departure, I don't know anything about those items after the first of August. Mr. Montgomery would know about that, that was about the date I left, I might say that an expense of that sort might in a way be criticised, at the same time after I left here my salary was done away with on the operating pay roll; whenever anyone else has left here some little thing has been done for the man leaving and a reduction has always been made in the expenses of the company through the fact that the new man taken on don't receive as much money or his position done away with, showing that it was an unnecessary bill at the time it existed. I don't know anything about the books after August first. Throughout this account for 1913 the recurring cafe bills at the Savoy Hotel each month, represents
906 the same item for the heads of the departments explained before.

Cross-examination continued by Mr. Morning:

Exhibit "338" is the general corporate expenses charged to operation for 1913. In other years we don't have just such an account, those items appear under other headings.

The first item January 25, 1913 "H. L. Doherty & Co., commission account payment 5% coupons, voucher #14473 $38.36", that is the usual commission paid to the fiscal agent for taking care of the payment of bond interest. Whether we charge interest itself to operation, the interest itself is taken out after we get our earnings from operation, we charge the expense of paying the interest to operation. That is merely a question of the division of the expenses, we are trying in our division to get at the operating results and we don't consider anything contingent upon the operation an expense, while the interest itself is constant, or an overhead charge, after we determine the net earnings from operation; I don't think we could classify an expense for paying interest as interest. Without going into all the items of that character it has been our custome to charge commissions and all expenses incident to the payment of coupons on bonds in payment of interest, also exchange on draft representing interest into operation.

I could not explain the items in this account under the words "transfer voucher" without seeing the vouchers. I think I could tell by seeing the vouchers.

January 31, 1913 "Lincoln Gas & Electric Light Co., rebate, voucher #14546 $39.70", I think that is a similar item to those before explained. It may represent a charge for an adjustment

or free gas, and the same is true of the next item, "$48.00 contingent."

907 Concerning why we enter some items as contingent and some as rebates, I don't know as there is any difference, rebates have to do with gas consumption itself and contingent has to do with cash discount for appliance bought and adjustment of appliance sales, but ordinarily would not contain an adjustment of gas bills, and also the contingent item might cover cash taken out of the cash draw-, street car fare and things of that character.

August 30th, 1913, "Voucher #15646, Empire Trust Company, trustee service 8/1/14 $40.00"; I think that represents the payment to them as trustee in the matter of our three year notes, I wouldn't be sure about that, either that or to pay the first mortgage bonds. Either the bonds or the $500,000.00 in notes to take up some of the bonds, *take* trust company has changed its name and I have rather lost track of them now. We don't charge the notes or interest to operation but charge the expenses contingent upon handling the notes.

November 28th, 1913, "Henry L. Doherty & Co. voucher #16070, register fees $30.00"; that is the usual fee paid to the fiscal agent as a registry fee for taking care of the stock transfers, it is a fixed annual charge per year for attending to the transfers of stock on the New York stock book. Whether we have a stock book here and at New York too, we have one at Columbus and one at New York where stock can be transferred; we have no stock transfer book here, just a record of the stock transferred.

Returning to the subject of rebates for free gas and electric service concerning Thomas H. Pratt, he never had any free service during the time I have been manager of the company. I know nothing about that. I do not know why his free service was stopped and others continued. I do not know of any case of free service of gas where no ledger account at all is kept of it where the service was given with the knowledge and consent of the company, no, we have had thefts. We have no gas services within my knowl-

908 edge, with no meter attached, no sir not where we are furnishing service in that way gratuitously on purpose, that would only be in the case of a theft; I might change that a little bit, we have furnished current to Church Fairs and things of that sort where they have had these outdoor suppers to just be connected up for a night or two, but no regular customers. I know of no other party or parties getting free gas besides, Whedon, Bignell the two Honeywell's and Pratt, and have no knowledge of any others. I knew why Mr. J. K. and Homer Honeywell received free gas I never knew why the others were put on the list, I don't know now, I never heard it explained I might have some general information but I don't know, as to Pratt I don't know about him at all and never formed or expressed an opinion about that.

Gas lost and unaccounted for is shown there, the expense of that gas is shown, it isn't necessary to include that in arriving at the total operating expenses. That is shown in the distribution depart-

ment expenses after all the distribution items are taken care of then the list of unaccounted for is shown as another separate item. Whether brought in there to the extent it is brought in it reduces our receipts by that much, I don't want to put it just that way, it doesn't affect our receipts one way or another neither does it affect our expenses. I don't want to say it affects the net receipts finally arrived at in our reports; the lost and unaccounted for gas only enters insofar as we have to manufacture it and get no money for it. Whether we charge it as a part of the cost of manufactureing gas, what I am trying to avoid is to say that while the lost and unaccounted for is shown in the reports, but as far as that is concerned, it is added to the expense shown because it is in. We show in our reports the total amount of gas manufactured or delivered to the mains, that is measured through the station meter, then we take the sum total of the readings of all the consumers' meter-, deduct
909 that from the amount shown by the station meter for the month's period, the difference is called "lost and unaccounted for gas". In entering the expenses of manufacturing the gas we enter the expense of manufacturing the total amount shown by the station meter in the first instance. As to what we do with the item of "gas lost and unaccounted for finally" we finally show it just as a matter of information on the reports as an expense in our manufacturing cost, that is done for the purpose of arriving at our distribution unit cost, but not for the purpose of arriving at our total expenses. It is handled in each instance by entering it in the total or manufacturing cost. This free gas furnished these parties is not a part of the "gas lost and unaccounted for", that is taken as if actually sold and collected for and then paid out again as so much money.

Whether or not this account headed "Allowances and rebates" includes anything besides rebates as if the company was called upon to make a contribution to a campaign, political or otherwise; we would not enter that expense in this account, only insofar as some small item might go through the cash drawer where one of our employees would get car tickets. That money so spent would be under contingent items, and no large amount is permitted to go through the cash drawer in that way; the contingent items take care of such things as express.

Whether I remember an item of expense incurred by the company at the time the city held an election to vote bonds to construct an electric plant and whether the company incurred an expense in an effort to defeat the bonds, that was years before I come to Lincoln, I don't know how they handled the expenses in those days in any respect, but they didn't have as complete a system as we have now.

Exhibit "338" being page 499 of incidental expense account, general corporate expenses charged to operation for 1913 received in evidence.

910 I do know when Mr. Bignell sold his stock in the company because I sold it, as to the total amount realized, I don't know it shows in the report, I think he had fifty shares.

Voucher dated May 21st 1910, #8092 reading "75 shares of stock of the Lincoln Gas & Electric Light Company bought from Mr. Bignell for Mr. William McConnell $1443.75", that is the item covering the sales of his stock and closed it out as far as our books were concerned, he sold all of his stock that was recorded on our books.

In exhibit "331," March 1904 "Emerson McMillen Company payment coupons, $12.50", the voucher shows the payment of $25.00 covering the payment of coupons, the amount we paid them for their services. I presume the item of April 30th 1904 $18.39 to the same parties would be divided equally between the two departments. I have a voucher here for $267.78 representing the expense of the audit made January 25th by Emerson McMillen Company through Mr. C. N. Jellife. Asked to explain the entry in executive salaries of $18.39, I don't see where that was entered in on this voucher. Emerson McMillen Company had an assistant secretary who preformed the same service as the secretary in Doherty & Co. office does now but I don't see how you would get $18.39 or twice that, all those expenses you mentioned are in connection with the payment of interest charges or an audit.

May 3rd, 1904, $16.50 representing onehalf of a monthly apportionment of a charge item of $115.50 distributed over several months reading Emerson McMillen Company for auditing books. I don't see that here. I have a voucher here covering an audit under date of April 30 1904 in the amount of $267.78 on the voucher #175, executive salaries was charged with $18.39 to gas and to electric $18.39, and $231.00 to special expenses and that amount was charged over seven months, that covers several items.

911 Voucher #431 June 30, 1904 is for $29.50 and the distribution is as follows: gas $12.50 and $2.25 in addition to that; to the electric department an equal amount. That was in payment of the June coupons for services of Emerson, McMillen Company, for handling that.

July 31, 1904 an item for $16.50 a monthly apportionment of the Emerson, McMillen Company item; I don't seem to have that item here under that date; I have a voucher for $120.00 distributed one half to gas and one half to electric departments, covering a check to Hanover National Bank of New York, transfer fees for one year, I suppose for transferring stock and divided between the two departments $60.00 to each. The transfer fee service for coupon payments and interest payments either to Doherty and Company or Emerson McMillen Company represents moneys paid by this company for handling coupon payments, transferring stock and auditing.

In 1905 voucher #1065 dated January 31, is a voucher drawn to the Trust Company of American for $37.50 in payment of their fee for registering stock for the year ending August 1904, one half charged to gas and one half to electricity, there is no other item on that.

February 28, 1905 "Voucher #1213 Chemical National Bank", that is a voucher drawn for $1014.97 to that bank covering an inter-

est payment on the first mortgage bonds plus the fee paid the bank for handling the payment, which fee was $24.90, and divided between the departments one half to gas and one half to electric. The interest payment was not charged to operation, just the cost of making the payment.

Concerning an item of $5.00 for special expenses occur-ing occasionally without any explanation, "transfer voucher 80-*a* special expense March 31 $5.00", I can't tell what that is without the voucher number.

The pay roll in the executive department at that time was entered $30.00 a month to gas, I take it it would be $60.00 between the two departments, that was before *by* time, it probably was for
912 paying the assistant secretary in New York.

August 31, 1905, "voucher #325 Paul R. Jones, secretary, directors' fees $25.00"; I find that item here for $50.00 receipted for by Paul R. Jones the receipts set out that it was paid out for directors' fees. He was not a director, he was secretary and drew the money and paid it over to them. That $50.00 was a portion half and half between the two departments.

Concerning about what the annual expenses are on an average for the last few years incurred by this company for auditing for the benefit of the New York office; well the audit has not been made any more for the New York office, than for the company, primarily for the company, I don't know what that would run but would say somewhere around $200.00 or $250.00, including the auditor's per diem and traveling expenses, but we have never paid his entire traveling expenses; some other company has paid a portion of it. That is, if he was going to Denver we would pay our proportion. The auditor is sent out by the Doherty people to make the rounds of their properties and he takes our company in on his trip and we stand our portion of it plus his per diem while he is here. I think they have something like 108 companies. I think we prepared an exhibit showing how much in addition to the auditing expenses, it would be per annum approximately for handling the interest payments on our bonds and notes in the form of commission, or exchange on drafts; I would rather not off hand approximate it as long as that is in here to show what it is.

Now taking the vouchers for 1907, "voucher #2618"; that is drawn to F. J. Rehleander for $176.76, the items are for stamps, express and such items as we ordinarily call contingent items advanced out of the cash drawer, and one item there of $50.00 was paid to the directors.

August 1907, "voucher #3924 Emersom, McMillen Company, fees, coupon, $169.78,"; that was the coupons due so their
913 invoice states, that was divided $112.99 to gas and $56.79 to electric; and here is another item, it also included their fee as transfer agents for the year ending in August. Whether according to that it would seem as though the coupons were entered in the operating expenses, I would say no, it reads "for the payment of coupons due December 1, 1906 $24.89; and for the payment of coupons due June 1, 1907 $24.89;" and $32.99 of that was charged

to gas and the balance to electric; it reads as if they paid the coupons and charged them in the expenses but still I don't know how we could make our books balance out on that. I wouldn't be sure whether that means simply for services in paying the interest or includes part of the interest, the information I have here looks as though it was an interest payment and not for services but on the other hand the fact that it was charged to expenses would indicate that it wasn't an interest payment. I don't know just how that was, that was before I had anything to do with this part of the work.

February 28, 1908, "voucher #4312"; this is a voucher drawn to the company for $157.28. I can't tell without quite a little arithmetic how that was apportioned between the two departments; it was all charged in that month for contingencies for February 1908. It was just a collection of small cash items paid out. Some of it went to stock it didn't all go to expenses. $1.10 went to stock.

The item of executive salaries called pay roll includes the presidents salary right along and afterwards the president and chairman of the board of directors and when the vice president got there he was put in as an executive receiving an executive salary. I think there was a constant item entered pay roll, that was the secretary perhaps. I don't mean the secretary at the New York end, there is an item for the New York end, but it has been a small item of $25.00. The pay roll item explained as the Bills Payable Ledger, was $30.00 in 1904 in 1907 $60.00, explaining the increase, one very good reason is that the general manager in very early
914 days received at one time less than $100.00 a month and finally got up to $100.00. The general manager might have been the president of the company in the early days before our having anything to do with the company. When J. K. Honeywell was general manager I guess Mr. Putnam was the president and later Mr. Thompson and others were interested. I don't know when the president of the company commenced to get a salary, I might add further that the secretary in the early days received hardly anything but later we increased his salary until Mr. Warner was getting $150.00 and then Mr. Phillips had gotten up to $125.00; our plan in these matters was to start a man in at a low salary and increase it as his work became more proficient and then when it got to a point where he demanded more salary to put him somewhere else and take on a cheaper man.

Now taking the vouchers for 1910, under date of February "voucher #8001 Doherty Operating Company salary H. H. Scott $48.00", I think that covered Mr. Scotts salary during the time he was here on consultation. He is general manager of the Doherty Operating Company, and was here in consultation in regard to the works equipment. It isn't his monthly salary it is simply the salary he received per day for the time he was here.

"Voucher #7998 Doherty Operating Company $30.00"; that voucher was $42.62 and covered $37.50 stock registrar fee; $1.20 insurance on bonds; $3.92 for telegrams; and was divided $34.09 to gas and the balance to electric. The amount I indicated $37.50 was for registrars fee exclusive of telegrams, that is for March 1910.

August 1910 voucher #8852 Emerson, McMillen Company transfer fees $144.00"; the total amount of that voucher was $224.99, including transfer fees for the year ending August 1, 1910 $180.00, which was divided $144.00 to gas and $36.00 to electric; and also interest charges on delayed remittances for coupons a portion for nine days in 1909, and another portion for
915 seven days in 1910, a total of $44.99. That is not a case where a portion of the interest actually went into operation, that item of $44.99 was the interest Emerson, McMillen & Co. charged us for not having our interest down there at the proper time; the interest wasn't delayed to the holders of the coupons but we didn't have it in Emerson, McMillen & Company's office soon enough. The point is, it was interest upon delayed interest, we didn't charge any part of the interest itself but the interest they charged us was for the delay and that went into operation, and included also the transfer fee for the transfer of the stock.

January 1911, "voucher #1073", I don't have that voucher here; that is drawn to the Chemical National Bank and the amount is $24.97 divided $16.64 to gas and the balance to electric. There is no explanation of the voucher, I presume it is for the payment of our interest, for services in payment of interest. That is another item. I don't see the other one.

For 1911, "voucher #9266 Emerson, McMillen Company for services $72.00"; that was a part of the total charge of $110.48 that was charged to gas and the items that made up that $110.48 were 56 cents for charges on check, and coupon fees $19.92; and transfer fees for six months $90.00 the fees were also for six months. February 28th a contingent item, "voucher #9463 $32.00"; that was made up of a large number of small items, there is an item shown for executive salaries $32.00 charged to gas out of a total of $118.36, I expect that was directors fees.

Voucher #10481 H. L. Doherty & Company commissions $74.00"; that is a portion of ¼ per cent bonus allowed on placing notes in the total amount of $92.50 the $74.00 being charged to gas and the balance to electric; those were the $500,000.00 three year
916 notes.

I mean by bonus they were allowed ¼ of one percent they got $92.50 as I take it from this voucher for handling some of them, not all of them.

September 1911, "Voucher #11180 H. L. Doherty & Co. transfer fee $80.00"; that is a fee as registrar in the amount of $37.50 to gas and the balance to electric.

November 1911 "voucher #11412 H. L. Doherty & Co. services $107.52"; that was a charge made by the Citizens Trust Company of Columbus and paid by Doherty & Co. and they were reimbursed by this company, as transfer agents and registrars of stock on the part of the Citizens Trust and Saving Bank.

January 21, 1912, "voucher #11774 H. L. Doherty & Co. commissions $38.35; that is their ¼ of one percent for paying the bond interest in the amount of $19,175.00,—and now that I see that,—I would rather think that the commission paid before in the amount

of ¼ of 1%, was for the same item rather than placing the notes; I think I was incorrect in my explanation before.

March 30, 1912 "H. L. Doherty & Co. commission and services $78.00"; I wouldn't know what that was; there are too many of those items for me to remember that.

June 1912 there is an entry here of $23.00 in the executive salary account, and explained in a note as closing out special account #1836 into the regular expenses "$345.00, expenses of Jones' audit to be closed out in twelve months ending May 31, 1913"; that was the cost of the audit last made. There were two auditors at that time, I wouldn't call that an average auditing expense, that was higher than usual and probably higher than it would be again.

In July 1912 the entry "executive salary account H. L. Doherty & Co. salary and commission $258.35", with a notation "voucher #12764 missing" I wouldn't know what that covered, I expect it was Mr. Doherty salary plus some commissions on some
917 coupon transactions.

August 1912, "voucher #13012 Windsor Trust Company services $40.00"; that was a portion of the total amount of $50.00 and charged to gas under a bill rendered by that company for services as trustee under indenture, dated August 1, 1911 for year ending August 1, 1913. The Windsor Trust Company is trustee for that issuance of the $500,000.00 notes, it was in connection with our bonds and notes.

Cross-examination continued by Mr. Foster:

In account #1501 entitled clerical salary, March 31, 1911, $18.80 to clerical salaries, with an item of $4.70 in the electric account #3225 from voucher #10006 from my present information I can not explain that.

Concerning vouchers #10131-10263-10639-11361-11499-11665-11825-11935 for $40.00 each issued in the same way; I know what that was; we took a man in here from Denver to do some work for us in our accounting department, he came there at $100.00 a month and stayed but a short time and in order not to disrupt our scheme of paying our clerks we put him in at $60.00 a month and paid the other $40.00 a month in another way, so that the bookkeepers themselves didn't know what it was for.

May 13th 1911, "Voucher #10241 Crawford Kennedy $150.00 special traveling expenses"; I don't know what that had to do with gas expenses; we have sent him out several times on trips for the purpose of creating a tar market; I wouldn't say whether that was one of the times or not, I wouldn't know.

July 31, 1911, "voucher #10696 A. H. Armstrong $1400.00 charged to Claude Meeker"; Mr. Armstrong sold his stock and we bought it direct for Chas. Meeker that is what the books show, that never went into expense.

918 October 31, 1911, "Voucher #11317 Frueauff & Robinson 573.95", services in reapplication Railway Commission to issue notes etc; I imagine that was their charge to us for their

investigation of how we had to go at that matter and drawing the papers; that had only to do with the issue of the $500,000.00 three-year notes, and was charged in the operating expenses.

June 30 1913, "transfer voucher #1794 closing out $1028.13 general manager's expenses to Homer Honeywell on General Ledger as recommended by auditor"; that occurring in the operating expenses month by month was an item that was being carried by the company at the time Mr. Honeywell resigned and we carried it against him, that is he would put his receipt or give his receipt, to the cashier for the expense money and leave it there until he accounted for it or paid the cash out of his pocket, well he never accounted for th-t amount, he possibly could in detail but that never was done and I finally recommended to the auditor that the entire amount be charged off and that has been done; I always thought that it was legitimate expenses which he incurred and ought to be taken care of at once but I never felt that I had direct authority to do it until I had authority from New York. I had no idea what the money was paid for. It was expense money as I understood it at the time I came here. I don't know whether he spent it in politics or how, I think it was money he spent from time to time and neglected to account for. In addition to the actual money for expenses that he did report. That amount of money has stood there on our books as being charged to Homer Honeywell and I finally charged it off into this year-s operation. I assumed it was a litigimate expenditure and I think I am right. I wouldn't want to say it was money he had taken out of the drawer and left a slip for all of that, that money stood against Homer Honeywell at the time over and above the amount referred to in the expenses.

March 30, 1908, "voucher #3342 $250.00 Homer Honeywell with no explanation," that was before my term as manager.

919 August 7th, 1908, a similar charge made under voucher #4966 for $250.00, I know nothing about it, that was before my time as manager.

April 27th 1909, "voucher #6244 Lincoln Gas & Electric Light Company is a slip dated August 28, 1907, received from Lincoln Gas & Electric Light Company $325.00 for cash. Signed Homer Honeywell and charged to operating expenses; I don't know what that is for.

August 31, 1912, "transfer voucher #1540 check issued to Strode $31.42 Strode's expenses in irrigation matter and paid through the New York office", those items in connection with irrigation matters were at times incorrectly charged to us and were later charged to the proper sources; I know in our expenses at times these items appear before they were corrected. That irrigation matter was this Nebraska Power matter, and Mr. Strode under a misunderstanding of how to make his charges charged a lot at first of the irrigation expenses to this office which in fact should be charged to New York and later changed his accounting system.

August 31, 1912, "transfer voucher #1554"; indicating the closing of an enormous bunch of repair accounts carried forward from the old coal gas days and charging them into operating

expenses, over $1500.00 went into operating expenses in 1912 when we were not making coal gas; our reason was for a considerable time we didn't make provision for bench renewals, that is where we repair the benches which cost a given amount to do it, we charge that off so much a month during the time we think the filling will last. That is a suspence account. After we stopped making coal gas we stopped making that charge off, I decided that was a mistake; as long as we had the benches there we ought to make some provision for taking care of that expense, even though we were making water gas, and then we commenced to charge off a certain amount to cover those renewals.

920 In so far as we did that in 1912, it would make that year's expenses abnormal, if my theory was correct it should have gone in in years prior to that, and in view of the fact it was not in there those expenses would be abnormally low, provided we extended those over a sufficiently long period of time. It is customary where we are making a repair or a renewal to attempt to spread the expense over the life of the article renewed, over the benches 2 or 3 years, sometimes we get more than that but it is usually the expense of operation; if we made a charge off for one bench in the course of one year that would be too much in my opinion. It would depend on how many benches we were charging off whether $1500, or a little over $100, a month in 1912 would be abnormally high. Even though we charged the correct amount and brought it forward from the year where it should have been charged to 1912, it would make the operating expenses for 1912 abnormally high to that extent and the other year abnormally low by reason of the fact the charge wasn't made then.

July 31, 1912, "transfer voucher #1515, coke shortage $647.82" closed out in monthly installments of $211.92 in operating expenses; that was to take care of a shortage in coke upon a correct inventory being made, we had carried more than we had in stock. If we had paid for a given amount of coke and couldn't account for all of it in the way of operating expenses when the coke had given out, we would have to make some provision for it. When we buy a large shipment of coke we do not charge it into the expense account in the first instance, we charge it right into stock, and assume that so much is used per month and run that month's estimated amount into the month's coke expense, upon discovering a coke shortage we charge that into operating expenses at a subsequent time, for the reason that evidently in taking our coke out of the pile we have taken more than we thought for our water gas machines.

921 Our monthly charges didn't charge off enough and those months where we under estimated, it would be abnormally low and to equalize it we carried that forward into subsequent months.

July 31, 1912, "transfer voucher #1517 S. E. Miscellaneous earnings $304.56" closing out miscellaneous earnings adjustment in 12 months; I can't say what that was, that "S. & E". don't mean anything to me.

January 31, 1910 "transfer voucher #852 expense Armstrong

to New York $150." closing out in account #1503 incidental expenses $20. per month to gas and $5. to electric; Mr. Armstrong went East on this gas suit it probably should have all been charged to gas.

July 30, 1910, "Transfer voucher #915, H. Honeywell $250." with an explanatory notation thereon, I don't know right at this minute what that was.

November 30, 1910, "transfer voucher #1022, incidental expense account, travelling expenses $45.48"; That is too far back, I don't know what that is.

Also on the same voucher "Legal expenses $26.60" per month to gas to close out E. C. Strode item $100. I don't know what that is, it is too far back for me.

The item of flood expense in 1910 spread over a number of months making a total of $250. was in connection with the high water that came down through the plant some time prior to that time and we charged it off during several years. That item is $250. a month to repair the damages caused by the flood. These valuable lots were covered by the flood but they are higher than that now, we filled them in and the water has been diverted since then, too.

January 1911, dollar gas agreement $126.62"; I think that probably covered our expenses in trying to arrive at an agreement through compromise with individuals. I testified to that yesterday.

February 1911, cost of bond dollar gas case $219.33"; I think that is where we apportioned the premium on that
922 large bond in this case.

May 31, 1913, "Transfer voucher #1180, gas sign on Burlington building $2000." entered in operating expense at $83.33 per month for two years. The new business department was charged with the cost of erecting that sign in the first instance; we sold the sign to Thomas Cusack & Company; and then that item referred to there was corrected and not charged as an expense, the 1914 new business expense would be abnormally low by the amount credited. I don't remember what we got for the sign. It was charged into new business expenses over a period of two years; during that period we received flat rates per month from our customers, and as we figured the sign would be paid for in that time so that with the charge to income they would equalize each other at the end of that period, we sold it and are now crediting new business for it. It doesn't make any difference whether it went in here or not the charge in there and the amount we credited new business was enough to pay for the sign in that period. As to how we expected to get new gas business through an electric sign;—we took a certain part of the revenue and put in our electric sales and appliances revenue and credited the new business expense, gas and electric both, then charged gas and electric both with the expense of the sign in a period that would equalize the expense and the credit. I am sure of that, I wouldn't say to the dollar, but on the plan I am right, then we sold it at a profit. The total $2000. for the sign is charged to new business expenses, and was apportioned 80% to gas and 20% to electric. The gas gets the money back through

the income we received from selling the space on that sign, we rented it out. When we got the receipts the plan was to apportion them in the same way. We took an arbitrary amount from our electric customers on the sign and put that in our revenue, it went into our flat rate. It got into our gas and electric depart-
923 ments both as a credit to new business. We received flat rates for that current, at so much per sign to those using it; we didn't sell it by the Killowatt. Figuring the amount of current we sold and assigned a rate to it, and put that in our electric revenue, not necessarily as a profit but as a credit to the cost of erecting that sign. We figured the sign would be worthless in two years and would have to be discarded. The benefits received by gas would be found in the credits to the new business department. New business gets credits, when we sell a meter for more than it cost that credit is given to the department and new business is given the benefit of the difference between what it cost and what it sold for. If I went through the books I think I could find how much we got out of that sign, I would be glad to do it.

June 30, 1911, "Transfer voucher #1190 $1659.96, advanced to Clerk of Supreme Court in dollar gas case when it was appealed, and was worked into operating expenses at $138.33 per month from June 1911 to May 31, 1912"; that cost was all finally taxed to the City when the case was reversed, but as yet we haven't received anything from the City, when we do that account will be credited back with it. At the present time we have advanced that much money that will come back and operating expenses for that period is abnormal, but one thing that should be allowed and considered is the interest on it when we consider the operating expenses.

June 30, 1911, is an item of $100. per month for new business referring to Gentry account, appearing for a number of months in that account. Explaining that item we had Mrs. Hiller come here and give a gas demonstration of the use of gas and gas stoves, she lectured at the University Temple, and that was the expense attached to her demonstration. It was to show the public how to use gas economically, I suppose a large percentage of our people don't know how to use a gas broiler; our effort was to get them to use everything economically that can be used.

924 June 30, 1911, "transfer voucher #1212, expenses W. S. Hunter, traveling Denver to Lincoln; I don't remember Mr. Hunter just now. T. O. Kennedy was a superintendent here at one time.

June 30, 1911, "traveling expenses to Iowa Gas Association $62.50" I imagine that represents 80% of that expense.

June 30, 1911, "traveling expenses B. C. Adams to Denver $42.75" I think that is the same item I have testified to before.

September 30, 1911, "$440. traveling expense Shuff and Adams"; that I believe was for a managers meeting at New York, just a convention of the Doherty Companies. I think we got value received for that $440. it doesn't take very much to save $440. in operating expenses; I think that is true of all the conventions we have ever attended.

October 30, 1911, "transfer voucher #1323, Frueauff & Robinson $573.95 services in connection with the $500,000. note sale", I think Mr. Foster covered that, it was entered in operating expenses $76.53 per month to gas and $38.26 to electric, and was their expenses in connection with that matter. The notes were issued primarily to take up some bonds about to mature. Items of that sort are considered contingent on keeping the property a going concern explains our reason for entering that into operating expenses. It is an inconceivable proposition to think of a company with money and not compelled to borrow any; I think the community should pay for getting that protected to furnish gas to the customers, I look upon that as one of the expenses.

September 1912, "traveling expenses Strode and Adams to New York $250."; I think I covered all those items.

Two vouchers, one #6513, July 3, 1909, E. C. Strode $75. I don't remember just what that was used for.

Mr. Strode: There are two or three of those and the record may show that $4300. of vouchers of that character may be charged
925 up as expenses in the Lincoln Gas Case, and not charged as operating expenses for the consumers to pay.

Cross-examination resumed by Mr. Morning:

I think $20. a day is the per diem paid by the company to the auditors sent here from New York to audit the books of the company, for the time spent on our work. I don't know that that includes time spent on the road; it would include any time put in on our work, that might be work performed on the road or in the New York office. The balance of the bill is actual expenses here plus railroad fare.

Redirect examination by Mr. Strode:

An examination of the books by the auditor is not a mere formal matter, it is a serious transaction absolutely; it is done for the purpose of checking up our system of accounting, to see that we properly account for money received and expensed, also to see that items of expense in the cost of producing gas and getting it to the customers is charged to the proper accounts.

Concerning criticism of expenditures for meals at the Savoy Hotel, incurred regularly every week; my notion of that was this: in order to get the best results out of our operating departments, we of necessity would have to have harmony among the various department heads; when working along during business hours we got into difficulties in the departments, through mis-understandings; it occurred to me if I could get the boys together on more of a social basis than business, we could thresh it out and work out our difficulty in sort of a kindly way and get along well together and that proved to be a very successful plan. These meetings were held every Monday noon.

926 That was to consider the affairs of the company as we had our luncheon there together, the different departments bring-

ing up and discussing matters concerning their departments with other departments, oftentimes forcibly and threshed out.

Concerning the expenditures for charitable purposes, Commercial Club and other organizations, my opinion is they are expenses incurred by all companies of this character, and also by all business concerns doing business in a town of this size. We cannot avoid making subscriptions and donations, the only thing is to make them reasonable, and still maintain their position in the community occupied by other business concerns.

Concerning the expenses for sending representatives of the company to attend meetings, conventions and organizations of gas companies, and in going to the New York office; I think they are reasonable expenses and we received value for the money so expended; the gas associations have been a wonderful factor in developing the gas industries. It is absolutely necessary to keep in touch with the development of the gas industry, to come in contact with the men who actively engage in the business, hear their notions expressed and discussed. There has been constant changes in the manufacture and distribution of gas in the last ten years, and those matters are considered by the people engaged in the business. In a general way the company has very largely profited as a result of these conventions in the improvement of service and methods of manufacturing and distributing gas.

In my cross-examination I indicated some items that might be taken out of the incidental expenses, that could be taken out of the portion of the earnings that go to the investors, rather than to be taken out of the public or consumers, those might be considered as proper items to be carried as an expense of the company and taken out of that portion of the earnings that goes to the investors; it is my opinion that the investor has some right to some of the earnings coming to him because he is an investor in the
926½ property, and that some expenses which might not properly
— incurred by the company in the interest of the public service, might properly be incurred, nevertheless, if borne by the investor in the company.

Recross-examination by Mr. Morning:

In a sense my attitude in regard to spending the money criticized here locally, contributions to colleges, charities, memberships in clubs, is that those were paid to maintain our standing in the community as being a public service institution and paying our share of what is commonly done by other business men. Not altogether to maintain favorable public sentiment towards the company, that was an element, of course, at the same time it is inconceivable that a company of this character could get along without making those contributions and maintain a business aspect in the community. The contributions were largely made to institutions and movements that would do the company good in the way of favorable public sentiment, and would also do the city itself a lot of good; we haven't only been interested in our own growth from day to day but the

growth of the city from year to year and making Lincoln a place that people cared to come to and getting them to come here.

Whether we have been interested in keeping down agitation of rate reduction, creating public sentiment among influential portions of the community, such as newspapers, churches, business clubs, and liberal with those particular institutions because made up of those influential portions of the community, and at the same time brought this suit to maintain a high gas rate in spite of the public sentiment among the consumers: I would not answer the question as you infer I should or as you put it at all. We have not been liberal in the first place, we have merely been reasonable in my opinion,

927 and we have not made an effort here to maintain a high gas rate, neither have we made an effort to create public sentiment in favor of a high gas rate; we have tried to create a knowledge here among the people of Lincoln as to the actual facts that existed in connection with the business of our company, and as has been brought out in the testimony here. From time to time we have, upon various occasions, made efforts to compromise this case, and when we have made those efforts we have tried to get to the public the facts as we saw them. I do not believe we could be accused of having made an effort here to maintain a high gas rate or to get people to accept it.

Whether our liberality, or desire to show a public spirit or create public sentiment would be better expressed in an economical management of the company and a reduction in the gas rate so that people who are least able to bear the expense would not have to bear the burden,—I would say we have made every effort in the world here, Mr. Morning,—and it is now a matter of common knowledge,—to get a reasonable method of making rate reductions, or to get a reasonable rate. Hardly to such a rate as our company denominate "reasonable". We have made concessions in proposed agreements that we thought were absolutely unreasonable, as far as we were concerned. That is the question I would like to talk about and I would be glad to answer any of your questions. I know you are trying to make the point that we have been lavish here, apparently, in expenditures, such as donations, membership dues, for heads of departments, contributions to Y. M. C. A., and like institutions, as you indicate, but on the other hand I think we have been absolutely reasonable in these expenditures, have never at any time been lavish; have done less by far, than many of the institutions that have existed here for years and years, with well established reputations and large business.

Concerning our weekly feeds resulting in Cafe bills, and

928 whether we could not have held such meetings in the company's office instead of incurring the Cafe expense of $30. or $35. each month,—would say we have also had meetings in the office here from time to time; every month we went over the reports, but we can't always get at the thing just as we want to just in that way, and I think you will bear me out in this, that in the history of this company for years back, there has never been any internal dissention in it; I can point to other companies in town where they have

had any amount of internal *idssention*, which has caused difficulty with the public service corporation itself, between it and the public, I believe we have been very successful in avoiding that, and I think our plan has brought it about. I have in mind a company where that internal strife was something horroble, but that difficulty has about been wiped out by adopting a plan something such as we have here. The method of doing our business here has been discussed by the Board of Directors and has been approved from time to time, in fact commended. The local member- of the Board of Directors have special interest in the results; they are citizens here interested in the growth of the community and the success of its institutions.

Whether they were mere nominal directors and had no more than nominal holdings in the company,—Mr. Raymond was quite a heavy stockholder, and other directors at one time and another have had considerably holdings in the company. I haven't anything to say as to what the policy of the company should be now at all, whether it is the purpose of the company to maintain that about as in the past; I am in no way connected with it. I know nothing about a disposition to change the policy. I am not connected with the company in any way. I don't know whether the gentlemen getting rebates or free gas are going to be retained on the free list. I am not an officer and have nothing to do with the company. I don't know as a matter of fact whether they are on the free list now.

929 Redirect examination by Mr. Strode.

Whether these expenses carried into the incidental expense account are reasonable as compared with other companies,—compared with other companies in which I have had experience they are particularly low.

Recross-examination by Mr. Morning:

My experience has not been confined to the Doherty companies. I have had experience with various companies in one way and another around the country, but not so very extensive.

Witness excused.

930 GEORGE A. MONTGOMERY, being first duly sworn, testified on behalf of the plaintiff as follows, pages 1923 to 1931, Vol. II, original record:

Direct examination by Mr. Strode:

I am at present manager of the Gas company. I was formerly superintendent. At the request of the city I had exhibit 88 prepared. It shows the cost of steam used in the gas department as furnished by the electric department. For instance, in January of 1912. In the winter months 20 lb. of coal per thousand ft. of gas made is

charged to the gas department and credited to the electric department. During the summer 15 lb. of coal per thousand ft. of gas is charged and credited. The 20 and 15 lb. apportionment was determined from actual tests before I came here. On the engines and in some instances where motors were used temporarily the kilowatt-hour consumption on those motors was converted into the equivalent of pounds of coal. After you have found the total tonnage the cost per ton is derived from the total steam expense in the electric department. In the 20 and 15 lb. charged to the gas department is figured all of the expense in the generation of steam. To find out what the total steam cost in the electric department is, include all the elements and divide that by the total coal used and then apportion to the gas department its share of the expense of using 20 lb. of coal.

Cross-examination by Mr. Foster:

In the month of January, 1912 we have $860 credited to the electric department and charged to the gas department, apportioned as follows: $350 for generating water gas, $100 for booster, and $410 for exhausters. The basis for the charge to the gas department for steam used in generating gas is pretty much the same over the entire country. The summer months 60% of the total steam charged to the gas department and credited to the electric department is on account of steam for water gas generation and during the winter months 50% is for water gas generation. In the month of
931 January, about 45 lb. of steam per thousand cubic ft. of gas made was charged to the gas department and credited to the electric department.

Cross-examination continued by Mr. Morning:

There is a charge made against the gas department for electric current used. That appears in the operating expenses. It is measured by a meter. The gas department is treated as a regular consumer of the electric department.

Redirect examination by Mr. Strode:

It is on a cost basis. The steam charge is, as I tried to explain, just the cost of the steam including all of the elements.

Recross-examination by Mr. Morning:

In figuring the cost of the steam the coal is entered at its cost price at the time.

932 GEORGE A. MONTGOMERY, being recalled for further examination, testified as follows, pages 1979 to 1983, Vol. II, original record:

Cross-examination by Mr. Morning:

The items of Sundry Labor in account 1115 represent labor items that don't go into gas-making labor and purifying labor, which are handled in 1106 and 1111. These items of sundry labor in 1115 are the general work around the yards. A portion of the man's time running the booster and exhauster and a portion of the time in unloading coke and oil, and then any small repairs around the plant go into this account. Line 1106 under the head of Gas-making Labor, covers all labor from the coke or coal bin or pile into the generator house and into the outlet seal boxes. This includes water gas making and all assistance for tinkering and removing the ashes and the necessary attention to apparatus, tanks, meter, motors, pumps, blowers, engines, and also cleaning out the seals and water gas making boxes. Between item 1106, gas making labor, and the labor under item 1111, purifying labor, we have the work in handling the gas beyond the seal. It goes to the relief holder and from there the exhauster pulls the gas through the condenser and scrubber and on out into the purifying boxes and you have one man looking after that exhauster all the time and we try to apportion his time and he is doing some other work part of the time. He gets $2 a day. About two-thirds of his time is devoted to this work. The labor necessary after the gas leaves the purifying house is that of the tending the booster. The booster is run for a while in the morning, at noon, and again in the evening. That item is now charged to distribution as the gas is then leaving the storage. Up to 1912 it was charged to sundry labor in 1115. Item 1115 represents labor also in keeping things generally speaking in good shape around the plant and there is always some little thing that comes up and needs attention and that means that his time will be charged to Sundry
933 Labor account. Item 1113 is General Works Repairs, and pertains only to the buildings and not to the apparatus.

934 GEORGE A. MONTGOMERY, being recalled for further cross-examination, testified as follows, pages 1984 to 1987, Vol. II, original record:

Cross-examination by Mr. Morning:

The men employed whose time is charged to account 1115 are, on the exhauster, a man by the name of Yawney, the man on the booster, Frank Martinsen, and the man who cleans up round the buildings every day, Joe Gagel. Then there is a man called Connors on at night, and J. F. Yawney, a son of the other Yawney. The latter is the general repair man around the plant and part of his compensation goes into this item. The amount depends upon

what he is doing. If he works on the buildings it goes into 1113. If he works a week on the blower of the water gas set that time would be charged to the gas making account. The time-keeper at the plant keeps track of this time and makes the apportionment to the different accounts. The total amount of his time charged to these different accounts should agree with his pay-check. Also the regular pay-roll would elucidate this one account. It gives the names of the employees at the gas works and the amount of their check. That amount is checked off and it is distributed over this classification so that a portion of that time would be charged to one account and another to another, depending upon what the man was doing during the period covered by the pay-roll. The time-cards are sent into the office and the pay-roll is made from them. The time-cards are the primary evidence upon which the account is built up.

935 GEORGE A. MONTGOMERY, witness for the plaintiff, being recalled for further cross-examination, testified as follows: Pages 3234 to 3241 original record.

Cross examination by Mr. Foster:

There have been no special agreements made for the price of gas to be charged in the city of Lincoln since I have been manager and I do not know of any such agreements now in force which were made prior to the time I became manager. If there were any I would know about them. I do not know anything about refunds made to V. Timmitch located at 822 O street. I would have to look it up. I have never heard of numerous refunds for over-reading gas meters at other places. I know of some instances where deducting meters have been installed. That is not generally a practice but in some buildings where it is impossible to serve a consumer on the second or third floor, without putting his gas through the main meter in the basement, then a meter is put in and the consumption on the meter is deducted from the main service meter in the basement and it shows up in the form of a deduction or credit. Voucher No. 5[illegible]3 to the Lincoln Coffee & Spice Mills, dated August 3, 1908 is a statement on the gas bill of that date for $14.05. That is all I can tell you about it. If there are any bookkeepers here now who were here at that time they would probably know. Possibly Mr. Adams, Mr. Phillips or Mr. Shuff would know. I can give no further explanation than what appears on Voucher 5285 of September 4, 1908 for $10. statement of gas used at 8th and Q streets signed by Lincoln Coffee and Spice Mills and same is true of voucher No. 5364 dated October 5, 1908 $10.57 to the same concern. Unless the words "Account R and S rates gas" on Voucher 2839 means readiness to serve, which is about the same thing as a minimum charge, I am unable to explain it. Unless the notation "Doherty rate gas" on Voucher 2982 April 30, 1907 on the receipt of the Lincoln Coffee & Spice mills for a rebate of $9.27 means that it was the regular Doherty rate. I am unable to explain it.

POOR

936 The Doherty rate is based not only upon the consumption of gas and the demand, but for instance, if you have a large gas consumer who used 50,000 feet of gas in an hour and for only one hour in the day, he would have an excessive demand charge, that is, the demand within this short space of time and for the other 23 hours he is not using gas at all. Now another consumer that would use the same amount of gas during the 24 hours uniformly distributed throughout the day, say for 18 hours, his demand on your mains would be nothing like as great as the fellow who takes it all in one chunk; yet the total consumption of gas is the same, so the Doherty rate was first used to take care of that situation and the more the consumer uses the rate automatically adjusts itself, decreasing per thousand feet used, but whether this Doherty rate was in effect and supplied to this customer I can not state. The Doherty rate over the straight meter rate takes care of an excessive demand over a short period and that man would not be entitled to the same consideration as the fellow who has the same consumption spread out over several hours. I know nothing about the consumption of gas by the Lincoln Coffee & Spice Mills except that they are a general consumer. From the nature of their business I would imagine they make a steady use of gas throughout the business hours of the day and the same is true of Timmitch. He is the ice cream cone man.

937 GEORGE A. MONTGOMERY, a witness for the plaintiff, being recalled for further cross-examination, testified as follows; Pages 3304 to 3316 original record.

Cross-examination by Mr. Foster:

I understand that the firm of Sloan, Huddle & Company were employed by our company to do some work in connection with this case in the way of a valuation, but I do not know what the nature of the work which they did was, except that it was relating to the work of the Wisconsin Commission. I do not have the report and have never seen one, and I don't know just what was paid them. Exhibit 382 is a statement of account of V. Timmitch taken from the consumers' ledger, showing the consumption of gas, the total gas amount in dollars and cents and the rebates in dollars and cents and the net rate per thousand. The net rates per thousand charged Timmitch were 89.8 cents, 90 cents, 92.7 cents, 80.5 cents, 81.20, 81.5 cents, 74.3 cents, 81 cents, 89.5 cents covering a period from March 6, 1911 to August 5, 1911. That was a Doherty rate. On the Lincoln Hotel account they were given no rating at all. Appliances were put into the Lincoln Hotel as an experiment, with the understanding that if they could get as good results cooking their meats, etc., with this gas apparatus, as they were previously getting with their coal range, etc., that they would then enter into a contract for gas and keep the appliances. This was tried out for these five months and at the expiration the appliances were discarded because they claimed they could do better with the old coal range. Now this rate from May 1st to June 1st they consumed

COPY

19,600 cubic feet, the gross amount in money was $23.50 and there was a rebate of $7.44. From June 1st to July 1st they consumed exactly the same amount of gas, but the rebate was $6.84, so there is evidently no record of just what the rate was, except that I suppose it was an experiment in putting the appliances in there. The net rate per thousand for the first month was 82 cents, the second 80½ cents, the next 71 cents and the next 61 cents, beginning with May 1, 1911 down to September 30, 1911.

938 The Lincoln Hotel service was discontinued then, but the service for Timmitch has been continued down to the present time at the same rate. The Lincoln Hotel pays the regular rate. Exhibit 383 is a statement of the account of the Lincoln Coffee & Spice Mills from November 26, 1906 to May 1, 1911 showing the consumption of gas in cubic feet, the total amount of money in dollars and cents and the rebates in dollars and cents and the net rate per thousand cubic feet. I will have it extended down to date. About the removal of the rebate slips in the Lincoln Coffee & Spice Mills account from the regular files, I inquired into this. If you will notice the voucher we have here, it is stamped with a rubber stamp, Lincoln Coffee & Spice Mills and signed by the manager and secretary of that company. I remember that those slips were sent down to their office and they were stamped with a stamp in their office and brought back here and I suppose it was carelessness about not sticking them in with the vouchers. They tell me that sometimes these slips are not returned until after the voucher is made up, although the amount of the rebate is included in rebate voucher for rebates and allowances. The consumer signs that rebate slip showing that he has gotten credit for it and then all of the rebate slips for each month should be pinned together and attached to the voucher as you saw those yesterday, but these going down to their office and not coming back at once is the only reason I can account for their being out of place. There was quite a bunch of rebate slips from this particular account lying loose last night all stamped and signed by Simpson, the manager. Exhibit 382 and 383 offered in evidence. Exhibit 384 is a telegram to Mr. B. C. Adams from Henry L. Doherty & Co. under date of January 4, 1910. I don't know anything about the meaning of the telegram nor what it referred to. I have been with the company here in active work since last March. I was on the company's pay roll from February 1912, but I was away until last March tied up on some litigation in Montgomery, Ala., in connection with the Doherty property there. I made five trips down there and my stays varied from two weeks to two months and I also had to go to New York in connection with that litigation. I was drawing $200.00

939 a month during that time from this company. Since I came to Lincoln the officers of this company have been the same all the time, with the exception I have taken Mr. Adams' place. Exhibit 385 is a night letter to Doherty Operating Company, 60 Wall Street, New York City, under date of June 23, 1910, from the Lincoln Gas & Electric Light Company, per B. C. Adams. Exhibit 388 is a copy of a letter addressed to Henry L. Doherty, 60

Wall Street, New York City, signed by the General Manager, whoever he was, under date of May 4th, 1909. I do not know whether it was the general manager of this company or not. After reading the letter I would say that it was signed by the manager of the Lincoln Gas & Electric Light Co. and was a part of files of that company. Exhibit 387 is a letter addressed to the Lincoln Gas & Electric Light Company signed by the Doherty Operating Company by Lewis S. Musil, dated March 11, 1910. Exhibit 386 is a letter addressed to the Doherty Operating Company, New York, signed by the general manager of the Lincoln Gas & Electric Light Company, dated May 18, 1910. Exhibit 389 is a letter addressed to Frank W. Freauff, New York, signed by the general manager under date of July 2, 1910. As far as I know these are all part of the records and files of the Lincoln Gas & Electric Light Company. In Exhibit 389 the Frank W. Freauff referred to is the same man that was then Vice President and now President of the company.

940 GEORGE A. MONTGOMERY, recalled for further direct examination, testified on behalf of the plaintiff as follows: Pages 4051 to 4059 original record.

Direct examination by Mr. Strode:

Exhibit 424 is the report of the gas department for the year ending December, 1913, showing the manufacturing cost, distribution cost, etc., with the amount of revenue. It is from the records of the company and is correct. Exhibit 424 offered and received in evidence.

Cross-examination by Mr. Foster:

This was completed in my office about the 6th day of January, 1914. The report is under a different classification but contains practically the same data as the reports for the former years. It is a new loose leaf form so that it can all be written in with typewriter. The other was in book form. The classification numbers are different, but are in form and the difference- appear for themselves. I do not know anything about the nature of the service rendered by Sloan, Huddle & Company and I have seen no report on correspondence of that work in the files. I will be glad to make a search to see whether there is any correspondence relating to it. I know that there is an item of expense in the 1913 account, of money paid to them, but I don't know what we got for it, I wasn't there at the time.

941 R. E. PHILLIPS, being first duly sworn, testified on behalf of the plaintiff as follows. Pages 880 to 911 original record.

Direct examination by Mr. Strode:

I am, and have been since February 1, 1911, Secretary and Treasurer of the Lincoln Gas & Electric Light Company. In my office is kept a record of all of the transactions of the company. These make

up the monthly reports which are sent to the New York office. We keep a summary of the receipts and disbursements of the company. I have been with the company since 1907 on different work. For two months immediately prior to 1911 I was general bookkeeper. I worked on the ledgers of the company for two and a half or three years. Those ledgers contained the accounts of the individual customer on which the meter readings are entered each month, and from which the bills are made and sent to the customer. From those records we kept the total of the bills for each month. We have four bookkeepers, each in charge of a division. I have with me the records of my department showing the receipts and disbursements of money by the company, beginning with January 1908 down to January 1, 1913. We have two books, the gas manufacturing book and the financial and comparative reports. The latter is a report of the receipts and disbursements. The gas manufacturing report shows the total gas sales for the year 1908 and the total operation expenses. It explains each one of the departments that make up the total operating expenses. There is no record there of the amount paid out in interest or the amount set aside for depreciation. It shows both the amount of gas manufactured and sold, number of customers and cost of manufacturing the gas. The items of cost are classified in these records by the month. The financial report deals with both gas and electric departments. A balance sheet is made up at the end of each month and also at the end of the year. It shows how the money was expended and the net receipts.

On the first page of the manufacturing book, beginning January 1, 1908, under the heading "Gross earnings" is shown all of
942 the gas sold, taken from meter readings, during the month, for all purposes, embracing domestic, fuel, industrial fuel power and street lamp. Gas is not now used for street light. In this particular place the amount sold is in dollars. It shows the amount charged which is not necessarily the amount received. Some of the customers may not pay their bills, and there may be some adjustments. The total amount charged for January, 1908, was $21,281.49, charged at the rate of $1.20 per thousand. The next column on the right shows increase or decrease over same months of previous year. There was an increase over January 1907 of $1,406.13. The next column shows the amount per thousand that we had charged on the books of the company for gas that sold in that particular month, and is compared with the same month of the preceding year. The first column includes neither rent nor contingencies of that kind. We do not really get $1.20 per thousand for the gas. This second column shows the amount per thousand actually received. In January 1908, the receipts per thousand were $1.19. In January of the previous year they were $1.1934.

The next subdivision "meter charges on minimum bills", shows the amount received where the amount of gas used does not exceed 300 feet. The minimum charge is twenty-five cents per month and this column represents that item. The next column, "forfeited discounts", represents the discounts which the customers have for-

feited. The rate is $1.20 if paid by the 6th of each month. An additional amount is required after that, and this column is this additional amount. As a rule some excuse is offered and the customers are allowed the discount, even though paid after the sixth. The next line shows the total of all of these items. They are all charge items. The next column shows the uncollectable accounts during the month. In this instance it is $250.00. This is an average figure taking it month by month. The minimum charge for gas totals $51.05. The forfeited discount was $270.08. The total of these three items is $21,602.62. The amount credited after
943 deducting the uncollectable is $21,352.62.

The next line is under the heading, "operating expenses". The pages following in this report show in detail the items which make up this item. Under the headings of manufacturing department, distribution department, collection department, and general department. The total manufacturing cost for January 1908 was $8,008.63. This is made up of the items, plant account and output expense. The distribution cost for the month was $2,015.24. That is made up of plant, consumers and meters. The cost of collection for the same month was $711.75 divided between consumers and meters. The general expense for this month $1,477.31 which covers executive salaries, general office expenses, office rent and local expenses, such as taxes, etc. The details are shown in this report. The total of these four items is shown in a summary on the first page. This expense is apportioned back upon a basis of so much per thousand feet for the gas sold. The expense for each department is shown at so much per thousand feet, also the expense per customer and per meter. It shows the distribution and collection and per meter.

Under the summary, "Sales population", the first column shows the gas sales in cubic feet for the current month and next column the same month of the previous year. The next two columns show the meters in use during the same two months. The next two columns show the average sales per meter in cubic feet for the same two months, and the next two columns the average sales per capita cubic feet.

The next, under the heading "Consumers", shows the total number of consumers by the month that number added and number taken away during the month, and giving the total at the close and a comparison with the number at the first of the year.

The next summary, "Consumers data", shows in cubic feet for both years the average sale per consumer. This is all finally combined in an annual report. The details of each of these summaries follows in the report for the current months.

On the following page of the report is given the different
944 items that go to make up the manufacturing cost for coal gas for that month up to the time the gas is put into the holders. That is divided into the cost of the coal carbonized, the enricher, deducting the credit for residuals as coke, tar, ammonia, and getting the net cost of the coal gas manufacturing materials, and then follows the cost of the retort house labor, bench repairs,

retort house, expense. Then follows the total cost of generating the coal gas. Then follows the cost of the steam that was used, the cost of purifying the coal gas, the labor expense and repairs and cost of purifying the coal gas materials, and general works, building repairs for the coal gas and the general works apparatus repairs for coal gas; then comes the sundry labor for coal gas, then follows general works, expense of supplies for coal gas, general supervision for coal gas, district holder stations for coal gas; then showing the total of the cost of purification and storage, and finally showing the total cost gas in the holder for the month. This does not include any charge on account of depreciation. It includes nothing but the items given. It does not include overhead expense and general expense, such as salaries of the executive officers, and legal expenses, and matters that are not directly connected with the manufacturing of gas. Then follows the coal gas statistics. This shows in cubic feet the coal gas that was made during the month, and for the same month of the previous year. The next line shows the coal used, and the next shows the coal in tons which was carbonized. The next line shows the yields per pound of coal. The next line shows the cost of the coal per ton. The next line shows the average number of retorts in use. The next line shows the average charge retorts. The next line shows the average charge per retort for twenty-four hours. The next line shows the average make per man charged in twenty-four hours. The next line shows the coke made per ton for the coal carbonized. The next line shows the amount of coke used for bench fuel. The next line shows the amount of coal used for bench fuel. The next line shows
945 the receipts per ton for the coke coal. The next line shows the receipts per ton for the coal carbonized. The next line shows the receipts for tar per ton of coal carbonized. The next line shows the receipts for tar per gallon sold. The next line filled in shows the candle power.

The next page of the monthly report gives in detail the cost of manufacturing water gas and also the water gas statistics for the current month, and for the same month of the previous year. The items included in this account are steam for generating water gas, generator fuel and enricher, and then follows the total cost of the water gas making material, then there is a credit for the water gas tar residue, and the net cost of the water gas manufacturing material; then there is a statement of the cost of the gas making labor repairs and water gas generating apparatus, water gas house expense and then the total cost of generating water gas. Then the cost of steam and labor purifying water gas, expense in repairs purifying water gas material. Generator works repairs to buildings, general apparatus repairs, sundry labor, work expense and supplies, general supervision district holder, work expense and supplies, general supervision district holder station, and then follows the total cost of purification and storage and finally the total cost of water gas in the holder for the month. One page shows the total cost of the manufacture of coal gas in the holder and the items going to make up that cost and the other page shows the total cost of the manufacture

of water gas in the holder and the items going to make up that cost. These items are assembled from the accounts payable journal. The items of expense during the month are posted to this journal under these subdivisions. They are entered on the journal from the invoices sent from the firms of which we buy the material or supplied from the pay roll, which are made up from the time cards sent in by the men who do the work, and from the requisitions on the material used from our stock. Each of the items in this monthly report can be checked back through the journal back to the
946 original vouchers for material and labor. The vouchers and invoices are in the records of the company and the reports can be verified. I fill out these reports of the cost of water gas and the cost of coal gas for the different months. These reports have to be accurate to enable us to get a balance of our books. At the bottom of the page are some statistics showing the B. T. U. of the mixed gas in the holder. They are based on daily tests made by the foreman at the gas plant. He uses a calorimeter. On the next page is shown the manufacturing cost of the mixed gas giving the total cost of all gas made during the month and the total amount of gas on hand and made during that month. The first part is merely a summary of the two previous pages. As to the gas account in cubic feet, the first line shows the gas on hand in the holder the first of the month, both for this year and the preceding year, and shows the increase or decrease and the per cent. The second line shows the coal gas that was made during the month and the third line the water gas that was made during the month. The next line shows the gas purchased during the month; the next line shows the total gas made and purchased during the month. The next line shows the total of the gas made during the month and the gas on hand at the first of the month. The next line shows the gas on hand at the close of the month. The next line shows the gas delivered to the mains during the month, and the next line shows the gas sold during the month. The next line shows the gas used by the company, and the next line shows the total of the last two. And the last line shows the gas unaccounted for. The gas unaccounted for is the difference between the gas placed in the holder and the amount sold and used by the company, but does not include the gas which is sold and not paid for. The unaccounted for gas is by loss of leakage, by loss through theft and condensation. On the next page is the record of the distribution department. It shows the items charged for the distribution of the gas. They are taken from the accounts payable journal, the same as the manufacturing cost. The items in this section are street main maintenance,
947 service maintenance, street department expense, pumping gas, meter expense, meter department expense, setting and removing meters and gratuitous work. The next line shows the total of the items enumerated. The next line shows the amount of gas in dollars and cents that was lost and unaccounted for. This is added to the distribution department expense as it has been previously deducted from the manufacturing department expense.

The item "Gratituous Work" covers work done by fitters and complaint men in looking after trouble and leaks and heavy bills on the customers premises. We have men to adjust gas ranges so that they will work properly, and that is done without expense to the owners of the range unless some great amount of repair work is necessary. The next department shows the data of the distribution department in the meter account. This section shows in detail the number of meters by sizes which the company owned the first of the month. Any that we purchased during the month and the total owned by the company at the close. It also shows the number condemned and destroyed, and gives the correct total at the close of the month. The next line shows the number of meters in use by sizes. The total and the number in stock, and the total in use and in stock, which must agree with the total owned. Another line shows the total in use during the year and another line the increase or decrease. This data comes from the distribution department which keeps a close check on the meters as they are bought, condemned, set up for the customer or removed. We have two sets of meter books; one is the card system by meter number and the other is the ledger system. They are both kept up to date, and must check up at the end of each month. The next page shows the cost of the collection department of the gas branch, showing in detail the cost of reading the meters, collect, clerical salaries, collection office expense, rent of collection office, delivering bills, cost of outside collections and finally showing the total collection expenses of the month. Outside collections include
the salary and wages paid to the outside collectors. The col-
948 lectors in the office are referred to as clerical help. The next section shows the collection department data, the cost of reading meters; the first column showing the total number of meters read during the month, the next showing the total number of hours and the next the average time of reading each meter. The next column shows the number of meters read per hour, and the next column shows the cost of reading each meter. The next column shows the number of meters that were not read the first time, but got the second reading, on account of customers not being at home or for some reason the readers not being able to get in the house. In the next column shows the number of hours it took to read the meters the second time, and the last column shows the cost of reading each of these meters. The next section shows the clerical salaries that were paid out during the month, and the next column shows the cost per customer of clerical salaries. The next column shows the cost per meter. The next column, the number of clerks and the next the average pay of these clerks. The next section shows the expense of delivering the bills. The next column shows the number of bills delivered by mail and by company's employees and the number of bills called for at the office. The next column shows the labor cost of these various items. The next column shows the expense. The next column shows the total labor and expense and the last column shows the total amount of expense and labor per bill by mail, by company's employees and those called for at the office, and the total. The next section shows the collections.

The first column shows the number of bills collected at the office by mail, at the office by tellers and the number deposited in the banks and the total at the office. The next number of bills collected by the company's salaried collectors, and then the total number of bills collected. The next column shows the amount of enumerated items; showing in the first line the total private gas bills, and the next line the balance outstanding at the close of the month. The next line shows the per cent of the total number of bills collected.

The next the per cent of the total amounts collected. The
949 next column shows the cost of collecting in each of the classes enumerated. The arrears for the current month is shown in detail in the next section, showing the amount charged to arrears, the amounts collected on previous arrears, and the total collection of each months arrears and finally giving the balance outstanding in arrears at the close of each month.

R. E. PHILLIPS, being recalled for further direct examination, testified as follows: Pages 920 to 954 original record.

Direct examination by Mr. Strode:

On the following page under the title "Executive Department Journal Expense" is a section showing the total expense for the current month and the same month of the previous year, with the unit figure of cost per thousand sold on the following items: Executive salaries, General clerical salaries, General Office expense, Incidental expense, Rent of Executive office, Local expense promoting new business and taxes, and then a total of the General expense. In the following section is given an analysis of the expense account of the new business department, which makes up a part of the total in the section above. The items in this account are advertising in newspapers, circulars and distribution bonuses, commissions, exhibition expenses, salaries and wages and miscellaneous expense, cost of appliances sold and appliance expense. The total cost of appliances less the amount received for appliance during the month, and showing the loss or profit on those sold. Next the expense of piping connections seggregated between the item of labor and miscellaneous expense, giving the net cost of expense of appliances sold connected during the month, and next the total cost of all the expense incurred in the new business department for the month is given. The last column shows the cost per customer for each one of these various items. The next section shows the appliances introduced and connected. The number of new ranges,

the number of old ranges connected, the number of hot plates
950 connected, the number of water heaters connected, the number of heaters and grates, and miscellaneous items connected and also the number of feet of piping used for the connections of these various appliances, and giving in unit the number of feet of pipe per appliance, and the cost of pipe and fittings for appliances and the cost of labor in connecting those appliances and the total cost of connecting appliances and the total cost of connecting per foot of pipe. In another section is given the illuminating

data such as houses piped by the company; houses piped by contract, gas arcs connected, and the number of miscellaneous illuminating appliances connected during the month. There is also a section for industrial fuel and power on the same line. The data which follows is of a more statistical nature and deals with the pay roll, special expense account, service pipe laid, mains laid and details of gas sales. The following page shows the gas sales, showing in the first column of cubit feet the gross sales, the next column the amount in money and then the same items for the same month of the previous years, and the increase or decrease in cubic feet and in per cent. The next line shows the amount that has been rebated on account of overreading or fast meters, and the following lines gives the total of net sales. On the last page is shown the low pressure street mains in feet and in miles according to size showing the amount of mains by sizes in use the first of the year, the amount laid each month and finally the total amount in use at the close of the month. This record with reference to the mains is in each monthly report back to 1902. Under the subdivision "Cost of Street Mains" is shown the cost by sizes of the mains laid during the month, divided between the labor and the material and then the total cost. On the next page is shown the number of service pipes laid during the month; the number in use the first of the month and the number in use at the close of the month. That is carried through each month back to 1903. The next subdivision is a statement of the cost of installing services divided between the labor and material cost, and showing the total cost.

951 The next section shows the number of appliances connected the close of the month, the number added during the month, the number taken out during the month, the number connected at the close of the month and divided between ranges and specifying the various kinds of appliances. The next page deals with special expense accounts showing the amount of money charged to these accounts during the month, and the item and the department into which they are to go. These items all come from the accounts payable journal and are shown in each month's monthly report. On the next page under the heading "Steam Account" is shown the amount of steam used during the month in the manufacture of gas and the items chargeable to the various departments, and finally the total value of the steam used in the manufacture of gas. The gas subdivision "Barn Account" shows the expense charged to the barn, what the items are. This section is taken from the account payable journal and goes into the various operating accounts. Under the "Rent Account" is carried a detailed statement of the amount expended for rent. Approximately 80% of the rent is charged to the gas department, the apportionment being made on the number of consumers. The "Barn Expense" is apportioned in the same way. The next page shows the pay roll data; the details showing the make up of the pay roll is shown. It includes the pay roll of every department of the gas branch.

These reports from month to month are accurate. I have here the monthly report, month by month, from January 1, 1908, to

January 1, 1913, for the manufacturing expense of the gas department. Annual reports are made under my supervision from the data that came in the monthly report. The identity of the items and such division in the monthly report is maintained and followed out in the annual report. The annual report for the years 1908, 1909, 1910, 1911 and 1912 are as nearly accurate as it is possible to make them. They are checked against the monthly report and they have to balance before they are sent in. Exhibit 26 is the annual report for the year 1908 for the gas department. Exhibit 26 is offered and received in evidence.

952 Exhibit 27 is the annual report for the year 1909 for the gas department. It was made up in the same way and under the same conditions as Exhibit 26. Exhibit 27 is offered and received in evidence.

Exhibit 28 is the annual report for the year 1910, for the gas department. Exhibit 28 is offered and received in evidence.

Exhibit 29 is the annual report for the year 1911, for the gas department. Exhibit 29 is offered and received in evidence.

Exhibit 30 is the annual report for the year 1912, for the gas department. Exhibit 30 is offered and received in evidence.

Cross-examination by Mr. Foster:

I am unable to say what is included in item 1017 in Exhibit 26. It is probably labor and material put into buildings at the general works, chargeable to the coal gas department. The details of this item are not shown in the monthly report for 1908, but I think it shows the various items that go to make up that figure under a similar heading. The details will be found in the accounts payable journal. The account number is 1017. I am unable to tell what the character of the items are without looking them up. I know it does not contain what might be considered permanent improvements, because the books are audited once a year by an auditor, and if he finds anything that would be considered of a permanent nature, he would take them out.

Item number 1018, "General Works, Apparatus Repairs Coal Gas", includes the total amount that has been charged through the various months of the year to this particular account, general works, apparatus and repairs. In order to say what it covers we would have to have the details, which are found in the accounts payable journal. Nothing pertaining to the electric department would be put into this account. The man who is on the job and oversees the repairs charges the expense to the proper account. In this account,

953 item 1018, there is never any item, part of which is charged to the gas department and part to the electric department, as that only includes items of expenses and repairs on the buildings at the plant, which is purely gas. There are no other buildings at the plant, which are used jointly by both departments. The expense of repairing work would be charged to this account. The boiler house is used jointly, but the electric department is charged with keeping it up and the gas department pays for its portion by being charged for the steam which it uses each month.

Item 1021, general supervision coal gas, $800.99 for the year 1908, is made up of the wages of the foreman of the gas plant and whatever help he has at the plant in supervising the manufacturing. Item number 1100, "Steam for generating water gas", is transferred from the electric department, where the boilers are situated. The steam used by the gas department is measured by a meter, and it is charged for the steam used. The figures $2,421.07 were steam in item 1110, and comes from the accounts payable journal. That represents the amount of steam taken from the electricity plant during the month. This steam is used for the purification and storage of gas. The amount is obtained by the foreman at the plant by meter readings and tests. I think the foreman ascertains the amount of steam used by taking the amount necessary for an average run of gas, and then figures the total monthly output and compares that with the meter and the foreman of each plant makes the apportionment. The figures go into the accounts payable journal on this account, and are taken from the transfer vouchers made at the end of each month. This is shown in detail on page 20 of the report, line 1110. There has been some additional expense charged directly into this account. The amounts charged to the electric department, will be found in the electric department's report. The foreman makes the divisions at the end of each month.

954 The figures in Exhibit 26, come primarily from the foreman's report at the end of each month. Item number 1111 covers the labor incident to purifying the gas, and expense of repairs to purifying house and apparatus. Any repairs of a general nature would be included in item 1113, "General works repairs and buildings". Item 1115 covers sundry labor around gas works incident to the purification and storage of the gas, which is not itemized into other accounts of this department. Item 1117, includes the salaries and wages paid to the foreman of the plant and those who have supervision over the manufacture of the gas. We have one foreman in the water gas department and pay him $110.00 per month. Some of the general superintendent's salary goes into this account. Some of his time is also included into item 1021, supervision of coal gas. Part of the overhead expense, known as general supervision, is also apportioned to the electric department. I think it is divided half and half. It is split up into different accounts. I make the apportionment. Part of his salary is also charged to the distribution department.

Item number 1116, works, expense and supplies, $2,109.35 covers the gas and electricity used at the plant for lighting and heating purposes, the water used for general purposes, stationery, telephone and the incidental expense of superintendence, laboratory apparatus and supplies. It is easy to tell where expenses of this kind are used, and it is charged direct to that department.

Item 1257, represents cost of the gas lost and unaccounted for and cost of the gas used by the company. We find the amount of gas lost or unaccounted for by meter readings at the holders and multiply that by the cost per thousand cubic feet in the holder. This was figured at forty and eighty-nine hundredths per thousand.

It is shown on the first page of the financial report, in column one, line 3 page 4. Item 1300 covers labor and material used in maintaining the mains, such as replacing mains or fixing leaks The detail is found in the accounts payable journal, under the same number.

In item 1302, the sum $940.39 "Charge Consumers", represents the amount that has been charged to the street department
955 expense in the accounts payable journal, and is brought about by the fact that we have consumers on the mains. It is the amount charged that is incident to keeping up the mains and services incurred through the use of gas by consumers. It does not mean that it is charged to the individual consumers, but is simply the amounts that are charged to the flat account, and is the amount of money which would be expended if there were no consumers on that main. The other items in this account are chargeable to the fact that there are consumers on the main. The items in account 1302, are expense for repairing street department tools, materials for such tools, including gas tanks, water hose, labor, etc. and expense incurred in pumping drips.

Part of the expense of superintendency, part of barn expense and expense of superintendent's horse repairs to the buggy and harness, taking street pressure and part of the salary of the superintendent of distribution and the wages of the foreman and men in this department. It is an operating expense. No part of it is for new service pipes or mains. Nor is any of it for relaying of any old service pipes. I can not tell the particulars making up this sum, without referring to the accounts payable journal. The account covers replacing of tools used in this department, but those tools would be charged to the construction account. The construction account appears in the financial report.

Item 1405, outside collection, $856.52, represents the amount paid to collectors during 1908, outside of our office. The collectors draw from $50.00 to $65.00 a month. They collect also for the electric department and their salaries are apportioned 80% to the gas department and 20% to the electric department. That is the relation which the gas consumers of the company bear to the total number of gas and electric consumers. It has no reference to the income of the two departments. The gross earnings of the gas department during 1908 were $234,347.51. And of the electric department $129,283.69. Item number 1402, collection, office expense,
956 covers incidental expenses of collection, office stationery, telephone and sundry supplies.

R. E. PHILLIPS, recalled for further direct examination, testified as follows: Pages 1684 to 1740 original record.

Direct examination by Mr. Strode:

Exhibit 101 is a statement made by me from 1902, to 1912 inclusive, of the number of gas consumers and the number of electric, served by the Lincoln Gas & Electric Light Company. It also shows the percent of the total of each, and shows the increase

from 1902 to 1912. It was compiled by me from the records of the company. Exhibit 101 is offered and received in evidence.

The Traction Company also has an electric department, and they have about the same number of consumers that we have. Prior to 1902 the number of electric consumers was smaller, although we have no record showing the number previous to that year.

Recross-examination by Mr. Morning:

Exhibit 101 includes all consumers on the company's line, including Havelock, University Place and the State Farm. The figures show the consumers connected at the close of the year. We sell electric current to Havelock to light the public streets. It is sold to a local company at wholesale rate. That is not included in the statement. University Place buys from the Traction Company. We sell gas direct to the consumers in Havelock. I have general charge and supervision of the bookkeeping department. I have a record of the revenues the company secures from the sale of its bonds and notes. I will prepare and produce a statement showing the revenues of the company as received under the present management from the sale of its stock, bonds and security and money borrowed on promissory notes with the date of the different transactions, and will show how the money was spent. The present bonded debt of the company is $1,129,600.00. That does not include
957 the $500,000.00 of notes recently sold. There are $40,000.00 additional notes in local hands, held by banks of the city. Two of them were just renewed on August 17th and 9th of this year. They were originally given in the latter part of 1911. We were in pretty hard straights at that time and needed money for construction work, and to pay interest on bonds. We put in a new water gas set at the plant and we were extending quite a few mains and lines at that time. We secured the money from the First National Bank, the Central National and the Nebraska State Bank. Officers of each of these banks testified here on behalf of the company. That $20,000.00 is the same item that is referred to on page four of Exhibit B of Mr. Lea's report bills payable. These notes and the $500,000.00 notes sold in New York represent the amount of capital independent of the sale of bonds. The $500,000.00 notes were sold at 97c. on the dollar and the money was used to retire $333,000.00 of matured outstanding bonds and $120,000.00 of notes that the company had outstanding at the time. A small deposit was left with Doherty and Company in New York City. When these bonds were paid the stock was left outstanding as partial collateral security for the $500,000.00 notes. These bonds are counted in as part of the bonded debt, and the $333,000.00 is shown on the other side of the sheet as an asset.

We keep a separate account which covers additional equipment or items of a nature which would increase the value of the property. Nothing of a replacement nature or bettering expense or maintenance expense is charged in this account. The manager and myself

determine whether or not an expenditure should be charged to the construction account or to the operating expenses. All new extensions are charged to the construction. All replacements are charged to maintenance and they would go into the monthly report as an operating expense. If we were to put in a new water gas set and discard entirely the old set, the original cost of the old set would be deducted from the cost of the new set, and the difference charged to construction. We have purchased two new water gas sets
958 in recent years. If the old water gas sets were not discarded, and were still in condition to be used, the new water gas set would be charged entirely to construction. I do not think we have charged off any part of the old water gas sets. In case of a replacement such as boilers, the cost of the boilers complete would be charged into a special account and closed out through the monthly operating expense of the company as a maintenance of the plant. If the new part replaced exceeds the cost of the old, the difference is charged into the construction account. If a piece of apparatus originally costing $10,000.00 was discarded and replaced by a piece costing $15,000.00, we would charge $5,000.00 to additional equipment, and $10,000.00 to maintenance and expense. The $10,000.00 would be carried through and charged off through the monthly report in small amounts during the probable life of the new machine. This has been the practice of the company so far as I know since the present management took charge. If the amount is small it is charged off in one month as a current operating expense.

Items not exceeding $100.00 to $300.00 are charged off as current operating expense. When they exceed this sum, or where it is so large that it would make an abnormal inroad on our receipts, we apportion the cost of replacement from the probable life of the article replaced. An old article is carried on our books as being of good value until it is discarded entirely. We are carrying the old coal gas apparatus at a valuation of $80,000.00, while we have not used it for four years. All expenditures have to go either into the operating expense or construction account. As far as I am able to say the plant is now in good condition. The amounts we have paid out under the present management have been sufficient to maintain the value of the plant and keep the investment unimpaired. That is the method employed by the company, to take care of the depreciation. We do not set aside any part of the gross receipts to take care of depreciation. In the final report there is a depreciation charge of $1000.00 per month for both the gas and electric
959 department, but it is know shown in the gas reports and it has not been taken out of the figures here. We do have a depreciation fund, we have the account but not the money. We keep the account so that in case we ever pay dividends this amount will be deducted from the earnings before they are declared. None of the reconstruction work has ever been charged against this account. Instead of setting aside the actual money and creating a fund, we have been expending the revenues of the company as we need them

to keep up the plant. The item of reconstruction is the same as a replacement and enters into the operating expense. We have a depreciation account of $1000.00 per month, but we have never had the money. We have not been charging reconstruction and replacement to this account. We have not been charging anything against it. The depreciation account has never been included in our net earning and has never been taken from the gross earning, and has not been used as an operating expense in the gas department. Possibly it was adopted on the presumption of creating a fund during the period of years to reconstruct the plant when it went to pieces by deterioration, but as a matter of fact the company has been taking care of the replacement and reconstruction as it went along, charging it to operating expenses. In the showing of net earnings here, we have not taken into account at all the reconstruction reserve account. The reconstruction reserve account does not appear in our accounts anywhere in the case, it was just carried in the financial reports after we had worked out the net earnings of the gas department. It amounts to about $92,000.00 today. It does not represent any property. We carry fire insurance on all our properties up to their full value. I will produce a statement of the insurance on all of our property. The purchase of the Peck's Grove lots was started before I became Secretary. I do not know what the Company paid for those lots. I will get a statement from our books and give it to you of the cost of those lots. The amount of working capital shown in subdivision five in the banks, December 31, 1912, was the amount ordinarily on deposit in those banks. We
960 have on deposit with Dougherty & Company something more than $27,445.89 at the present time. At the First National Bank there may not be as much there now. At the Central National there is probably on deposit at the present time half of the amount shown in Mr. Lee's report. We have probably now about $3000.00 on deposit with the Nebraska State Bank. We have to carry these amounts on deposit in order to pay our current expenses, bills and pay rolls. Our pay roll averages close to $9,000.00 per month. In addition, we have to pay for coal, coke, freight pipe and oil. In December 1912, our current expenses were approximately for the gas department $17,000.00. Mr. Lee has shown in his report for working capital $71,150.49. This sum is necessary for the gas and electric department. We pay interest four times a year on our bonded debt, June 1st, December 1st and our $500,000.00 notes February 1st and August 1st. We draw 6% on the Henry L. Dougherty & Company account. The bank accounts are all check accounts. They represent moneys accumulated and taken from our current receipts and money borrowed. We had, on December 31st, enough to pay off the $40,000.00 notes, but had we paid them, the next time the interest became due, we would have had to borrow it. The interest we draw from Dougherty & Company is shown as a non-operating income, in addition to the income derived from gas. It is in every one of these reports. I will show it in the statement you asked me to produce of revenue derived from sources other than

operating the gas plant. We carry casualty insurance in all departments outside the office. I do not know what rate is paid. I will ascertain the rate. I am unable to say whether or not the income from interest has been shown here as an operating income. We pay $450.00 per month rent for our offices at 14th. & O Streets, and do not sublet any part of it. Mr. Montgomery's salary is apportioned 80% to the gas and 20% to the electric department. The Superintendent's salary, the salary of the general manager, of the book keepers who keep both accounts, the superintendent of distribution, the store room men, and the purchasing agent and
961 stenographers are all apportioned the same way between the two departments. The expense of the barn, hay and feed, is also apportioned between the two departments and taxes. Insurance is not apportioned. The barn expense is apportioned 80% to gas and 20% to electric, because we have 10 horses and all but two of them are used in the gas department. I believe taxes are apportioned one-third to electricity and two-thirds to gas. The determination of the other items depends upon the manner in which they are used. The items of expense in the office in the keeping of records are based upon the number of customers: 80% to gas and 20% to electricity. Just now 75% and 25% would be nearer for the clerical force. I will produce a statement of the gross receipts of the electric department for 1912. I can produce a statement showing the separate construction account of each department, gas and electricity. I have in my charge the original books and records of the company that installed this plant back to 1875 practically complete. I will produce the records if there are any showing the amounts paid for preliminary investigation and preparing articles of incorporation and expenses of that character incident to establishing the plant. Money spent for repairs or renewals is kept in what we call the operation and maintenance expense account. The items of coke, oil, labor and various repairs for the apparatus enter into this account and replacements. You could pick out of this account the items spent for repairs and replacements. Account Number 2183 does contain all the items of money spent for repairs and replacements and renewals, but I do not know whether there is anything else there or not. The account is devised for the specific purpose of showing the items of repairs and maintenance, but that is not all. It does not mean repairs and maintenance of everything in the plant. We do put in there the account of repairs and maintenance on the particular branches of the plant enumerated in the blank. Other items of repairs and maintenance are not segregated from the operating expenses. I have under my control the records of the meetings of the Board of Directors for both this corporation
962 and its predecessor. I can place these books at the disposal of the City's representatives for examination at my office. At the time the present company took over the company, a new set of books was opened and the valuation was placed upon the property and entered in those books. I do not recall what the valuation was; the books were here at one time. I will examine my records and files to ascertain whether or not there was an appraisal and

produce it if there was. Part of the furniture, when it was purchased was charged to current expenses and part to construction. I can only tell what portion by knowing whether or not there was a replacement or a new piece added. $12,391.00 has been charged to construction; that represents as nearly as we are able to determine, the exact amount we have invested in office furniture and fixtures and charged to construction at the time of this appraisal. None of it was treated as replacement. It was paid for from our current earning, and replacements charged to current operating expenses. Those charged to the construction account were also paid probably out of the current receipts.

Redirect examination by Mr. Strode:

The issuance of the $500,000.00 of notes and the collateral security of $333,000.00 of bonds were presented to the Railway commission. It specified the conditions under which the notes were to be put out and how much they were to be sold for and what was to be done with the money and we have reported to the commission of the disposal of the notes and the amount of money arising therefrom. The Railway Commission required that the bonds be put up as collateral for the notes. It was almost impossible to put out a bond issue at that time, and the notes were issued in hopes that the bond condition would get better. If a coal gas set was taken out and disposed of and a new water gas set was substituted to take its place, the new water gas set would all be charged to construction. However, when we replace a piece of equipment with a similar piece, we charge against the cost of the new equipment the original cost of
963 the old one. If two lengths in a gas main in a block were taken out and a new one put in that would be charged to maintenance. It would not appear in the construction account. If a new main were constructed that would appear in the construction account. We have had a place in our books for dividends, but we have never paid any. There has never been any funds in the dividend account. It is customary to have a place in the books for a dividend account.

Recross-examination by Mr. Morning:

I will go through our records from 1902 to date and make a list of the important items of this plant which have replaced old items and where we have deducted the cost of the old and the cost of the new, and will show where it appears in the record. I do not know whether the predecessor paid any dividends or not. The present company has been paying interest on substantially $1,500,000.00 of bonded debt. Most of the surplus has been put into construction. We have been paying from 5% to 6% on bonds.

Redirect examination by Mr. Strode:

The bonds are on the combined property of the gas and electric light company and interest payments have been made out of the combined receipts.

Recross-examination by Mr. Morning:

I do not know whether or not the bonded indebtedness was increased at or immediately prior to the change in management.

964 Redirect examination by Mr. Strode:

Prior to the time that this company bought it in 1901, I think the gas rate was $1.75 and $1.50. They changed it every two or three years and in 1905 or 1906 it was changed from $1.50 to -1.20 per thousand by this company. If any dividends were paid prior to 1901, it was during the time they were getting a rate of $1.75.

Recross-examination by Mr. Foster:

There is no interest being paid on the underlying $333,000.00 of bonds in the $500,000.00 note issue. The reductions made prior to the $1.00 Gas Ordinance was voluntary on the part of the company.

Redirect examination by Mr. Strode:

Between 1901 and 1906 the company has furnished gas below the requirements in the ordinance voluntarily.

R. E. PHILLIPS, being recalled for further cross-examination, testified as follows: Pages 1939 to 1984, original record.

Recross-examination by Mr. Foster:

In Exhibit 30 under the subdivision Coal Stock, of the item under 2300, $800.00 was charged off on account of shortage. At the close of April, 1909, our report shows that we had 777.83 tons of gas coal on hand amounting to $4,303.73. At that time we stopped making coal gas. This coal was sold to the company's employees, some to the electric plant and there is still a little on hand. That $800.00 was charged off in 1912 and 1913. It was charged into the manufacturing cost of water gas and I believe went in as steam expense.

965 Cross-examination by Mr. Morning:

The $800.00 charged off was approximately $400.00 a year, 1912 and 1913. It was not used in the manufacture of gas that year, but when we were making coal gas it was used and not charged off. For the years 1912 and 1913 it would disturb to that extent the true cost of manufactured gas and to the same extent it would disturb the cost of coal gas in prior years. It did increase the cost of water gas for 1912 and 1913; it should be eliminated for these years to get the actual cost, but it should be added to the prior years.

Redirect examination by Mr. Strode:

From 1906 to 1909 they were manufacturing coal gas. The ordinance in question took effect in 1907. The $800.00 could not

be charged off in 1907 and 1908 and up to 1909 because the error had not been discovered.

Recross-examination by Mr. Foster:

Prior to 1909, I think the company had always manufactured coal gas. At the time we ceased making coal gas, this item threw our books out of balance. I do not know when the variance between the book and the actual stock on hand took place, nor does anyone else.

Redirect examination by Mr. Strode:

The 113.6 tons would likely be discovered once a year when the coal stock gets to a low point. Sometimes our stock got down to a very low amount. We use- to take an inventory twice a year, rather than once a month, as now.

Direct examination by Mr. Strode:

Amendment to Occupation Tax Ordinance identified as Exhibit 144. Tax schedule for 1906 identified as 145. Tax schedule for 1907 identified as Exhibit 146. Tax schedule for 1908 identified as Exhibit 147. Tax schedule for 1909 identified as Exhibit 148. Tax schedule for 1910 identified as Exhibit 149. Exhibits 144 to 149 inclusive forwarded and *and* received in evidence,
966 Exhibit 150 identified as insurance data requested by the city. Exhibit 151 identified as report filed with the State Railway Commission. Exhibit 152 identified as the total purchase price of Peck's Grove property. Exhibit 153 identified as statement showing non-operating revenue from 1907 to 1912 inclusive. Exhibit 154 identified showing gas customers outside of Lincoln. Exhibit 155 identified as statement showing last time six foot six inch water gas set was operated. I have not yet all of the data requested by counsel for the city, but what I have completed I have here. Exhibit 150 is insurance paid by the Lincoln Gas & Electric Light Company, and cyclone insurance from March, 1908, to 1914. However, there are a couple or three policies for three or five-year policies. They cover the property of both the Electric and Gas department. The insurance can be segregated to the different departments. On the Fire Insurance that covers the barns, sheds, wagons, harness, feed, etc., and we charge 80% to the gas and the 20% to the Electric department. The insurance on the holder is all charged to the gas department. The insurance on the buildings at 33rd and X Sts. is all charged to the gas department. The insurance on the roadster is chargeable 80% to the gas and 20% to the electric department. $211.68 is the amount chargeable to the gas department. It represents 10% of the total insurance paid on fire, all of the insurance on the gas holder and 20% of the insurance on the Waverly Roadster and 80% of the premium on the furniture, fixtures and stock accounts. Exhibit 151 was prepared at the request of the city. It is a statement of the report filed with the State Rail-

way Commission on February 7, 1913, showing how the $500,000.00 received from the sale of the notes was disposed of. Exhibit 152 was prepared at the request of the city. It shows the dates of the purchase of the different lots in Peck's Grove and the amount paid for each set of lots. Exhibit 153 was prepared at the request of the city and shows the non-operating revenue received by the
967 company from 1907 to 1912 inclusive taken from the records of the company. Exhibit 154 was prepared at the request of the city, and shows the number of gas consumers outside of Lincoln, January 1, 1913. Also the number of electric consumers for the same time and place. It also shows the gross electric sales for the years 1911 and 1912, and shows the expense of the election on December 28, 1912. It was taken from the records of the company. Exhibit 155 was prepared at the request of the city and shows when one old Springer six foot six inch water gas set was last operated. It was taken from the plant reports. These exhibits show what the records contain. The other statements requested are in course of preparation.

Cross-examination by Mr. Morning:

Exhibit 152 gives a history of the Peck's Grove real estate purchase. Lots 1 to 6 inclusive in Block 2 includes the house for which we paid $3,000.00. The balance of the lots were vacant lots. Lots 7 to 15 inclusive cost $1,000.00. Lots 1 to 6 inclusive in Block 7, cost $1,750.00. Lots 7 to 15 in Block 7 cost $1,500.00, making a total of $7,750.00. Exhibit 154 shows that the gas election of December 28, 1912, cost $1,559.24, on which we have a rebate coming of something like $100.00. What advertising was done for this election went into our regular advertising expense. This item of $1,559.24 did not go into our operating expense for 1912. It is being closed out this year.

Cross-examination by Mr. Foster:

I prepared Exhibit 151. I secured the figures from the report made to the Railway Commission. This shows the correct disposition of the money. The report first filed with the Railway Commission shows that interest was paid in the sum of $9,990.00. This was incorrect. The second line on the exhibit represents the report as made to the Railway Commission. That second line represents notes that were outstanding and were taken up August, 1911. We did not report to the Commission any part of this $500,000.00
968 was used for improvements and betterments. The petition of the company asking for leave to sell these notes represented that they were to pay for improvements. I do not know what the improvements were.

Cross-examination by Mr. Morning:

Our books will show what we did with this money. We had from time to time borrowed money, $500.00 or $1000.00 at a time

from Doherty & Company and when we sold the notes we owed them $108,000.00 and we had permission from the Railway Commission to take up all accounts or notes payable. I will add a statement of the notes showing dates, amounts and when paid. Exhibit 156, identified, is the manufacturing report for the first six months of this year and is offered in evidence. Exhibit 26 shows the operating results for the gas department for 1908. It shows the sales and operating expenses in the sale. It does not show all of the disbursements. The last month we made coal gas was April 1909. The report of 1908 shows the separate cost of manufacturing coal gas and water gas. The first item in the cost of the manufacture of water gas is shown on line 1100. In all of these reports each item has the same key number. Item 1104 water gas tar residue, represents the amount received and put into stock for tar during the period of operation, and this amount is deducted from the total operating expense. It is treated as a credit. In 1911 we manufactured 244,251,700 cubic feet of water gas. In 1912 we manufactured 258,205,600 cubic feet of water gas. The increase was 13,953,900 cubic feet. The tar residue in money in 1911 was $4028.44. In 1912 it was $3319.72. There was a mistake made in previous years in charging up the amount of tar to the per thousand cubic feet of water gas manufactured, and as the tar was put into a well there was no way of measuring and this discrepancy was not found until some time in 1912. We were crediting too much tar per thousand cubic feet. When it was possible to take an actual inventory we found the shortage. Mr. Montgomery has testified to that and explained it, and it has also been corrected in Mr. Lea's report.

969 I am unable to explain why the tar residue was almost twice in 1908 what it was in 1907. I had nothing to do with the reports then and do not know how it was handled. The amount of the tar residue each year is determined by test which has been made to show the number of gallons of tar made by the manufacture of 100,000 cubic feet of gas. We sell the tar residue in barrel lots and in five and ten gallon cans. In 1912 it was selling for $3.00 per half barrel, and $5.00 a full barrel. The entry under line 1104, $319.72 represents very nearly the amount actually received in 1912 for the tar. Against the price received of $5.00 and $3.00 we have to charge expense in handling, drayage expense, expense of barrels, advertising, etc. During 1911, it was figured at the rate of 60c. a gallon per thousand cubic feet of gas manufactured, and then in 1912 it was found that approximately only .076 of a gallon of tar is made per thousand cubic feet, and on this basis we made the correction for 1911. It was figured differently during the previous years, and to all appearances all right, because the inventory was not off. In 1910, we used .6 of one gallon per thousand cubic feet of gas manufactured as a basis. The same figure was used in 1909. In 1907 it was 35/100 of a gallon for every thousand cubic feet of gas. The average for 1912 was 45/100 per gallon per thousand cubic feet of gas made and in making the correction we used .076.

Redirect examination by Mr. Strode:

During certain periods of time, I was credited on the books of the company at the rate of .6 of a gallon per thousand cubic feet. For part of 1912 it was entered at the rate of .076 and the average for the year .45 cents. By actual test in 1912 we found we were only making .076 gallons per thousand cubic feet. That was due to the fact that we were using a much lighter oil than we had been since some time in 1911. .45 was not the average the tar manufactured per thousand cubic feet of gas during 1912, but was the average amount between .6 and .076 credited on the books of the company.

970 Cross-examination by Mr. Morning:

The actual amount was determined by a test made at the plant. We started to use the lighter oil in 1911. When we found there was a discrepancy, and that we did not have as much as we claimed, we made an actual test, and charged back a portion of the amount and from that time on we have been charging it into the tar stock at the rate of .076 gallon per thousand cubic feet of gas manufactured. This oil was the gas oil company's oil. The distributing point is Chicago. The price fluctuates. We are now paying close to 5c. Two years ago it was 2½c. The heavier oil had been purchased from the Standard Oil Company. Our contract expired and they tried to hold us up and we found we could get the lighter oil much cheaper from the Gas Oil Company.

Line 1107 refers to repairs to water gas generating apparatus, in 1907 it was $1,045.53. The water gas generating apparatus represents the two gas machines and generators. To this account is charged the labor and material for such items as re-lining the generators, repairing the carburetor, and super-heater, repairing the clinker door and oil sprayers. I am unable to give you the details without referring to the books down stairs. I am unable to say what the steam shown in line 1110 is used for. Item 1111, purifying labor, includes expenses, repairs and materials as well as labor, and it may easily fluctuate from year to year by reason of excessive expenses. In 1114, general apparatus repairs for 1911, $5,000.26, I am unable to tell what that sum represents without referring to the record which shows in detail what the repairs were. This account 1114, general apparatus repairs includes repairs, the labor and material and expense of the general apparatus which is beyond the seal boxes in the water gas plant. Account 1107, repairs to the water gas generating apparatus, refers only to the generator, carburetor, and super-heater, and not to repairs beyond. I am unable to tell you how much you spend each year for general apparatus alone and how much for other apparatus. Line 1115, sundry labors, includes

971 the labor that pertains directly to the manufacture of water gas, and is not chargeable to repair accounts, nor to gas making, boiler room, purifying house or general supervision. Account 1106, gas making labor refers to labor used in the generator house from the coke or coal sheds. It includes the water gas

maker's salary and his assistants, who have charge of the clinkers and removal of ashes. The necessary attention to tanks, pumps and blowers, and those who clean out the seal in the wash boxes. Item 1111 is purifying labor, and it includes expense and labor in the purifying house. Account 1115 covers what is left by these accounts. I am unable to tell what it represents in any particular case, without looking up the accounts payable journal.

R. E. PHILLIPS, recalled for further cross-examination. Pages 2073 to 2091, original record.

Cross-examination by Mr. Morning:

Exhibit 165 is the interest which has been paid to manufacturers during the period of 1907 to 1912 inclusive, on notes given to them in settlement of our accounts with them. It is interest on bills payable. I have prepared a statement showing the replacement of units from 1907 to January 1, 1912. It does not include any partial replacement of any items. During that period there were only three credits to the construction account, where the whole unit has been replaced, and in one of them the purifying boxes, the replacement was made prior to 1907 and the old boxes were sold in 1908. A partial replacement is handled on our books as maintenance and repairs, and the construction account would not be effected. Absolute replacement and repairs do not affect the construction account. Where the units or items are replaced with an entirely new piece, the construction account is affected to the extent that the cost of new item exceeds the original cost of the old item. If a gas meter is junked, the construction account is credited with the cost price of the meter, and it is charged to meter maintenance. The new meters purchased are charged directly to the construction
972 account, and then as they are used to replace others, they are credited to that account and charged to meter maintenance. In case of a sale of meters, the construction account would be credited with the amount. In case of a sale of a second hand item, we would take the original cost from the construction account. Exhibit 166 is a statement of replacements as above defined, from 1907 to 1912. Items junked are displaced by items of the same character, and credited to the construction account at the actual cost, as nearly as that can be ascertained. The first item on Exhibit 166, shows under date January 1, 1908, a sale of purifying boxes to a concern at Grand Rapids, Michigan, for $500.00 and means that the construction account was credited with this sum. Several years previous new boxes had been put in and the old boxes had not been disposed of until this time. That entry represents what we got for the boxes, not what they originally cost. That was done instead of crediting the original cost because these boxes were displaced long before the present management had taken charge of the company, and the new boxes were there when the inventory was made and these old ones were considered as mere junk value. If the old boxes were in the construction account at the original cost, then there was left in that account the difference between that cost

and what we received for them. The second item of February 28, 1912 of $2,340.40 represents the amount paid for the complete installation of our office furniture, in the new offices. Only $1840.00 of this item was charged to construction and the balance was charged to expense and represents the estimated value of the old fixtures which were discarded. The old fixtures were stored. Some of them have been disposed of. The $500.00 is what we estimated, had already been charged into construction on account of the old fixtures. We did not attempt to get at the original actual cost. It was what we thought had been charged to construction. If the construction account had been charged with more — $500.00, the excess stilll remains there.

On the other item, March 25, 1912, we paid the Otis Elevator Company $525.00, $475.00 was charged to construction and
973 $50.00 was charged to operating expense. We estimated that that was what the old lift, a very crude affair, would cost. We credited construction with $50.00 and charged it to operating expense. Each of the last two items were charged to both gas and electric. Eighty per cent to gas and twenty per cent to electric. Statements of repairs and maintenance are identified as Exhibit 167. It shows by years the cost of the repairs and maintenance of the item enumerated, the total cost of labor and material being segregated, covering the period from 1903 to 1912 inclusive. It covers everything done in the way of repairs where the whole unit had not been replaced and charged to construction. The items pertain to the gas department alone, except as otherwise indicated, such as harness, wagons and barn repairs. In 1906 items barn $8.20, harness $125.54, wagon $179.06, appear on the exhibit 80% charged to gas. On the books of the company I find that we charged two-thirds of these items to gas and one-third to electricity. The exhibit on these items does not represent the division actually at the time. The same division was made in 1907. In the summer of 1908 the division of these items was very nearly 80% to gas and 20% to electricity. And this division has been continued practically down to the present time. The division of the barn expense has always been made upon the number of horses used by each department. The change in the division would indicate that in 1908 the gas department was using more horses than in 1906 and 1907. It does not indicate that there had been a general change in the division of expense. Exhibit 165, 166 and 167 are offered and received in evidence by the defendant, without objection. As to statement requested, showing the total of revenue received by the company from 1907 to 1912, by the sale of stocks, bonds and notes, I find there is but one item and that is a sale of the $500,000.00 three year collateral notes, which was introduced at the time the request was made. Of course there were small notes to local banks at different times, the proceeds from which we used in our current operating expenses.

974 R. E. PHILLIPS, recalled for further cross-examination. Pages 2099 to 2120 original record.

Cross-examination by Mr. Morning:

In 1904 the only executive salaries paid by the company were to H. L. Doherty, $125.00 per month to gas department and A. L. Eglington, $12.50 per month. The same amounts were charged to the electric department showing an equal division of the salaries of these two men. They are both residents of New York. These same salaries were paid and this same division maintained up to the month of April, 1908, when they were prorated 80% to the gas department and 20% to the electric department, but the salaries were not increased. From January, 1904, to January, 1910, there were just two persons in the New York office drawing executive salaries and they are the ones above specified. In February, 1910, A. H. Armstrong was added to the executive department as local President and a salary of $166.66, 80% per month was apportioned to the gas department and 20% to the electric. Mr. Frank W. Frueauff, was also added as Vice President of the Company, $160.00 per month was charged to the gas department and $20.00 to the electric. Mr. Doherty was chairman of the Board of Directors. Mr. Armstrong continued to draw this salary up to April, 1911, when he resigned for political reasons. Mr. Frueauff took his office and Mr. B. C. Adams took Mr. Frueauff's office, without additional salary as he was already manager. In addition there was charged to this account those men in the New York office, who did special work, such as auditing and engineering. An audit was made once each year to enable us to run the business economically. I will make a search of the letter file for any correspondence relative to putting Mr. Armstrong and Mr. Frueauff on the executive salary list. The Board of Directors meets once a year at the local office and as many other times as called. I will see what the records of the Board of Directors shows with respect to the placing of these men on the executive salary list. Mr. Armstrong was a stock holder while he was an officer. When he resigned he sold his stock.

975 Mr. Fraueuff is and was a member of Henry L. Doherty Company. Items designated, "Pay roll in the Executive salary account" includes salaries paid to local officers by pay checks. The other salaries being paid by vouchers. I am unable to tell who the employees are without looking up the pay roll book. Without looking it up I would say they were the general manager, secretary and treasurer. Other employees are entered in other accounts. In 1904 there were no items entered in this account under the heading pay roll. The first entry comes in 1905, of $50.00. This item was continued until August, when it was increased to $75.00 which was then continued to 1906. That represents salary paid to local men by pay roll check. That would include just the executive department. In December, 1907, it was $104.18 for the gas department. In December, 1908, it was $166.68. In December, 1909, it was $250.00. In December, 1910, and 1911 it was $320.00. In December, 1912, it was $340.00. In May, 1908, this particular item was apportioned,

two-thirds to gas and one-third to electric. After that time it was 80% to gas and 20% to electric. Prior to April, 1908, the division was 50% to each department. Prior to May, 1908, the regular salaries of the legal departments were divided 50% to each plant. After that the division was 80% to gas and 20% electric. Prior to May, 1908, taxes were divided one-third to electric and two-thirds to gas. And that division has been continued up to the present time. At the time this change in division was made, the gas department consumers had increased so fast that it was necessary to make a re-adjustment of the apportionment of expense. The gas department had been running ahead for a number of years. The situation was probably discovered by the auditor. I never saw any correspondence relative to it, but I will look through our files and produce the correspondence if I can find it.

976 R. E. PHILLIPS, being recalled for further cross examination, testified as follows: Pages 2242 to 2260, original record.

Cross-examination by Mr. Morning:

The item in March 1904 of the executive salaries account of $12.50 paid to Emmerson McMillian & Company represents the commission of these people for handling the coupons on bonds. Interest on bonds is not charged to operating, but the cost of paying the interest is. I am unable to explain the item of $18.39 paid to these people in April, and charged to the interest account, without looking up the original voucher. I will get the vouchers and explain this, and the items for May and June. On June 30 they were again paid coupon fee $12.50 for handling coupons and it was charged into this account. The item of July 31, $60.00 paid to these same people was probably the fee charged for registration of stock transfers. There is a stock register kept in the New York office. There is a stock register also kept here. The item paid to the Chemical National Bank of $12.49 represents the expense of handling coupons. It is the cost of paying the interest on bonds and probably is an operating expense. I am unable to explain item of September 30th, transfer voucher 36*a* for $21.50 without looking it up. That seems to appear there every month for several months. It probably is some item that is too large to run into one month's operating expenses, so it was pro-rated over several months. Item of Dec. 30th for $12.45 to Emmerson McMillian & Company is for handling coupons on bonds as previously explained. Item of January 31, 1905 to Trust Company of America for $18.75 is for the registration of stock. The next item, transfer voucher 66, proportioned incidental expenses is probably some large item chargeable to executive salaries, which has been pro-rated over a certain stated time. Item of February 38, transfer voucher 73 is for $3.00 but should be for $5.00 and is for the same. Item of same date to Chemical National Bank for $12.45 is for services in paying interest on bonds. Item of March 31, transfer voucher number 80*a* for $5.00 is the same item as above carried along.

977 Item of August 31, 1906 to Trust Company of America, $18.75 must have been for registering stock in New York.

Item of $12.49 Chemical National Bank, on the same date, represents services for paying interest coupons. Item of September 1906 Emmerson McMillian Company, is for registration of stock in New York and the item of $7.59 on the same date is for transfer of stock. Transfer voucher number 264 for $13.64 is for surety bonds on executive officers. It appears in the subsequent month. Item of $12.50 December 1906 to the Trust Company of America, is for services in connection with the payments and cremating of bonds. I am unable to explain what item of $25.00 to S. J. Rehlander, January 1907 cash contingent is for, without looking it up. He was cashier of the company at the time. I am unable to explain item of March 1907 to Homer Honeywell, salary $36.46. In March 1907 the executive salaries were increased to $89.50. I do not know what caused the increase. In April, transfer voucher 354 for $13.63 is the portion of the bond for executive officers. I am unable to explain items of $25.00 and $36.46 in transfer voucher 366 without looking them up. The executive pay roll goes up to $104.18 which I am unable to explain. Item of May 1907 Harry Warner, $20.00 director's fee, means that he paid the directors $20.00 and he was repaid and the sum charged to executive salary account. That is the proportion charged to the gas department, and is one-half of the total amount paid. The pay roll for this month is $104.18 and continues in that sum through the balance of the entire year. In August 1907 item of $112.99 to Emmerson McMillian Company must have been for the same services as for the items previously explained, to that company. Item of February 28, 1908 to Chemical National Bank, is for handling the interest coupons on bonds. I am unable to explain item of the same date, $25.00 to Lincoln Gas & Electric Light Company contingent. I can explain it by looking up the voucher. In April 1908 the pay roll goes up to $135.43. In May it went up to $166.68.

978 Item of $44.78 appearing in May, June, July, August, September, October and November and $43.36 in December, represents the sub-division. The executive salaries pay roll for March 31, 1905 was $35.00. On December 31, 1912 it was $340.00. The increase is caused by the additional men added to the pay roll and by the higher salaries paid those already there. At the last mentioned date, there were two men, I do not know how many there were on the first mentioned date. In April 1905 transfer voucher 89 special expense $5.00 is the same item carried through. The pay roll was $30.00 down to August 1905. June 30, transfer voucher 104 special $5.00 is the same item carried through. Also transfer voucher 104 for $12.00. They must all represent the same thing, and that is the expense of the yearly audit. That is the only item I can think of that would be properly chargeable to executive salaries. That Auditor is on a regular salary and audits the various companies operated by the New York office. The money is paid directly to Doherty & Company, and they pay the Auditor. He makes one trip to the West and audits all of their companies, and the expense is divided. He is generally here from one to two weeks. I will get the total audit expenses per annum from 1907 to 1912. On July 31, 1905 we lose the $5.00 item, and we have transfer voucher 111*a* for $12.00

which represents the same expense as the $5.00 item. Item of August 31, Emmerson McMillian Company $5.00 transfer fee is for services in keeping the stock register as previously explained, and item of $12.49 to Chemical National Bank is for coupon fees. Transfer voucher 120*a* for $17.00 is the $12.00 and $5.00 combined and is probably in connection with an audit of the books. I am unable to say what the item of $25.00 to Paul R. Jones, was for, without looking it up. The item of $17.00 runs through the months of September to December of 1905 inclusive and January and February of 1906. Commencing with January 1906 the executive salary pay roll is $75.00 and runs through all of that year. The item for April 1906 transfer voucher 196*a* surety $5.00 is for premium on surety bonds carried in the local office and probably explains the $5.00 item
979 that we have been going over so often. It is, I think, handled the same that the auditor's expense is handled. The premium is paid once a year and then it is pro-rated over that of some larger item, the nature of which I am unable to state, without looking it up. In June 1908 item of $30.00 to Emmerson McMillian Company and Trust Company of America, is for services of these concerns similar to those already explained. I can not tell the exact nature without the voucher. Item of August 1908 to Emmerson McMillian & Company for $135.82 is for their services as transfer agents. Item of November 1908 Doherty & Company, expense and item for Jones, $131.60 I suppose represents the expense of his audit for that year.

980 G. H. SHABERG, being first duly sworn testified on behalf of the defendant as follows: Pages 3241 to 3248, original record.

Direct examination by Mr. Foster:

I am voucher Clerk for the Lincoln Gas & Electric Light Co. and have occupied that position since April 1913. I have been with the company about nine years. The rebate voucher slips for December 1913, $10.47, November 1913 $10.31, September 13, $4.59, August 1913, $7.36, July $6.92, June $8.12, May $14.85, April $10.00, are rebate slips paid the Lincoln Coffee & Spice Mills. If they run back to January 1912 they would all be for the Lincoln Coffee & Spice Mills. The purpose of these rebates was simply to figure them at the Doherty rate. A party using the amount of gas they were using, it would not be possible for them to do it on a $1.20 rate. The more you buy the cheaper rate you would expect to get. I can not tell you just how that rate is figured. It was less than $1.20. V. Timmitch had the same general arrangement. The Lincoln Hotel has no such rate at the present time. I do not know of any former rate. I do not believe there are any other consumers who have this rate. I would not know of any vouchers prior to April 1, 1913. We have no consumers that I know of, other than those mentioned, who pay a different price for gas used for fuel than they do for gas used for light. The system of installing two meters was abandoned some eight or nine years ago. Since I have worked with the company I do not know of any instance where they have installed gas service free. The dollar sign in the consumers' ledger in front of a large number of

names of consumers, indicates that those people had signed a waiver, waiving their rights under the gas ordinance for dollar gas. We were trying to get a compromise and take this case out of Court and we used that method of keeping track of the people who had waived.

981 It was simply a record of negotiations of our effort to compromise. There is no claim on the part of the company that the waiver signed by any of these parties is now effective. Their waiver was conditioned upon our getting enough to put it through.

GEORGE H. SHAEBERG, recalled for further direct examination, testified on behalf of the defendant as follows: Pages 3344 to 3348, original record.

Direct examination by Mr. Morning:

Voucher No. 10,696 is a payment of $1,400.00 which the company made to Mr. Armstrong. Mr. Armstrong in turn paid it to Claude Meeker. Meeker afterwards paid it to the gas company. It does not represent an expenditure at all. When it was repaid it came through on our receipts for the month. It was never charged as an operating expense. He is a broker in Columbus, Ohio. I do not know why it was paid and then he paid it back to us. Voucher 10,872 to Dr. J. S. Leonhardt for $19.85, itemized, 73 feet services $18.25 fuel run $1.60 with the notation "Allowed, no charge, B. C. A.", from the reading of it, would indicate that it was a complimentary or free service. I do not know why it was done but it is an unusual thing. It is not carried on extensively. I am unable to explain Voucher No. 11,218 to M. V. Beghtol for $252.00. It is charged to E. C. Strode, Oct. 26, 1911. I know nothing about it. The Ed Bignell account of $538.55 was charged off to bad debts; why I don't know. I would consider it a bad debt. I don't believe he could be made to pay it. Exhibit 390 offered and received in evidence.

982 HOMER HONEYWELL, being first duly sworn testified on behalf of the defendant as follows: Pages 3316 to 3342 original record.

Direct examination by Mr. Foster:

Voucher No. 4956 dated August 7, 1908, of the Lincoln Gas & Electric Light Co. for $250.00 signed by myself, was for general manager's incidental expenses. I can't give the detailed items now, because it is so long ago it has passed from my mind. I suppose that it is for the incidental expenses appearing in the incidental expense account under the entry sometimes as general manager's incidental expenses, and sometimes as expenses, varying in amounts from $25.00 to $50.00 and running all through that account and I think it constitutes the same kind of expenditures, but that has been too long ago and I haven't been in active touch with the details of the business since that time. Voucher No. 6244 dated April 27, 1909, for $325.00 signed by J. C. Oppenheimer, to which is attached a

receipt signed by me for $325.00 cash I can not explain what that money was spent for. I suppose that is another voucher made up from the incidental expenses of the general manager. These incidental expenses would be caused by a number of things, entertaining visiting gas men, prospective bond buyers, stockholders that came here to look over the property; probably some donations to charity; church fair tickets and things of that kind. The notation cash C. Y. over my name, I don't know what it indicates. I didn't sign that. I do not know whom the initial "E" appearing there refers to, probably some clerk. It has been too long since I have had anything to do with it. The purpose of these vouchers is to explain what the money was spent for, but the time has been so long that I can't do it now. I would be willing to swear that that money covered by this last voucher was not spent in the city election that spring. We did not take any part in that. We didn't contribute anything to anybody's campaign nor to any movement involved in the campaign while I was manager. I cannot state what the notation from
983 Lincoln Gas & Electric Light Company, $100.00 for "M. L. M. Adams, comp." and signed Honeywell, dated January 30, 1905, appearing in voucher 1214 dated February 25, 1905, means. It is too far back. I suppose it is composed of a number of small items taken out and put into a ledger. I do not know what the words "Adams, comp." means. It is too far back. I have no idea and I would not want to guess. There has been some memo. put on while I was leafing through the vouchers. I do not know whose initials L. M. N. are nor do I know whose initials M. S. M. are, but they are in my hand writing. I do not know what the purpose was of putting the initials there. Voucher No. 5710 dated January 15, 1909, for $225.00 signed by myself and marked O. K. H. L. D. was after I had left the company. I suppose that represents incidental expenses of the manager. They collected my tickets and this voucher was made up after I left the company and was O. K.'d by Mr. Dougherty. The details I can't give you. Voucher No. 4342 for $250.00 dated March 30, 1908, is probably another voucher covering incidental expenses of the management, the details of which I can't remember at this time. I left the company January 1, 1909. The item in Exhibit 323 January 1907 city Y. M. C. A. subscription $50.00 means that we probably gave the Y. M. C. A. $50.00 at that time. The item of $12.50 to the National Electric Light Association I suppose is the company's dues to that association. The next item Homer Honeywell, December and January, expenses, $50.00, was incidental expenses of manager and is probably the same class of items as covered by the vouchers just gone over. The next item O. Rector, candy $4.20, I imagine represents that we gave the young ladies working in the office a Christmas present. Wherever those same items appear throughout the Exhibit, they were made, I should judge, for the same sort of expenses during my term. The item in February 1907 L. G. and E. L. Co., contingent, ball tickets $7.50 represents some sort of ball tickets that we bought and paid that amount for them. It would be a donation to some cause or institu-

tion. I do not know what vouchers 3051 the same month, Emmerson McMillian Co. S. O. Appleck and postage $10.17, is for, nor
984 do I know what the item to the Lindell Hotel in March, $75.00 is for. The company at that time did not take their employees out to dinner about once a week, but they had meetings of the heads of the departments at lunch every Monday noon, and we would sit around the table and talk over the propositions that were coming up and we used to try each month, for some time, to get every employee of the company out to a dinner, thereby thinking we could get the best out of the employees. It was done for the good of the company. At those meetings we had the employees of both departments. I can not tell you what division of the expense was made and I would not be able to say whether that item was for dinner or was for some engineer that we had here from New York. We frequently had engineers from New York. They were helping us out in trying to cut down the cost of running the company and to run the property in a more efficient manner. Some of these engineers might have been connected with Doherty & Company and some McMillian & Company, who were at that time interested in the property. The item of April 1907 Lincoln Commercial Club, membership $10.00 was evidently for putting someone into the club at that time. The company made a practice of paying memberships. The next item H. Honeywell, expense $49.80, I do not know what it was for. Neither can I tell the fourth or fifth items, $10.85 and $25.00. They might have been incidental expenses or they might have been business trips I had taken for the company. It is too far back to remember. The Iowa District Gas Association item of $6.00 represents the dues of this company. The next item the Lincoln Gas & Electric Company, contingent services Ben Kiffin, $2.00, Notary Fee 50¢, Stuff, lunch and Billiards, Commercial Club, .85¢, Woodman Ball ticket, 25¢ total $3.60 I am unable to explain. I don't know what Kiffin's services were, I don't know what the Notary fee was, I don't know just what the lunch and billiards 85¢ would be, Stuff was not the name of one of our employees. The next item $22.50 B. C. Adams, expenses to Chicago, we probably
985 paid Adams' expenses to Chicago for some purpose or other connected with the company's business. If he had gone for Doherty & Co. there would have been charged to them this amount. Wherever the item Lincoln Commercial Club appears throughout this Exhibit, I think it is for membership fees and dues for various employees. I can not tell whether the item Lindell Hotel $3.25 in June 1907 and $35.62 in July 1907 was the expense of taking employees out to dinner or for what purposes. We usually had our dinners at the Lincoln Hotel and the people stopping here generally stopped at the Lindell. The item of 3072, May 1907, H. Honeywell, expenses $80.00 I do not know what that is for. I do not know what the next item is: M. B. M. $25.00 and I do not know who O. D. H. is in the next item; nor C. C. J. $25.00 in the next item, nor A. T. Large $100.00. It is impossible to remember those things so far back. That money was not spent at large in the spring campaign. The O. D. H. does not refer to O. D. Herrick, I am very

certain. I can not explain these items at all. Wherever the item Y. M. C. A. subscription, appears, that means money donated to Y. M. C. A. I do not know anybody by the name of A. T. Large and I don't believe ever did. I wouldn't say that it means "at large" rather than a man's name. I have no impression on it. If I wanted $25.00 or some such an amount for some object, I would get the cashier to give it to me and he would put a ticket in there. If I bought ball tickets I would get the tickets and if anybody wanted to use them all right, if I donated it to the poor or Y. M. C. A. they probably gave us a receipt. These items of $100.00 or the like might have been a number of small items and when they got to $100.00 a voucher of them was made. The form of vouchers, the way they appear here with several small items entered and credited and carried off into the proper colum-s, indicates to me that I did not get $225.00 cash at one time. It would look as though I got $80.00 at one time, $25.00 at another, $25.00 at another, $25.00 at another and $100.00 at another. In July the item of $12.50 donation to Lewis Gregory, represents what we probably gave him for some worthy cause in some
986 matter of charity that he was looking after. He didn't get that personally. It wasn't for anything connected with the gas business. It was probably true that most of the items entered in this account as a matter of fact had nothing to do with the manufacture of gas. The donation to Mr. Gregory was not made to help out the gas company in the public mind. It was probably made to help out some Russian family. They are expenses that most business houses would be subjected to. They were not made so much to avoid the ill will of persons refused as it was to extend a helping hand. The item in November 1907, Commission paid to C. R. Wigert on two years notes, $20.00, as I remember about that time we tried to float $200,000.00 in notes and we gave a commission for selling them. They could not be sold at par so we paid a commission. I don't know what it was charged to. If it is in incidental expenses, account 1503, it probably was charged to operating expenses. In March 1907 the item of expense Doherty Operating Company, expenses F. W. Freauff, voucher 5507 and 5508 amounting to $81.50 covers Mr. Freauff expenses. We probably had him here for some purpose and paid his expenses. He was connected with the Doherty Operating Company and at that time I think was Vice President of this company. I do not know what the item in May, T. P. Kennard, vouchers No. 4518 $16.00 was for. The next item H. C. Porter, expenses to Omaha for commercial department $24.00, was probably his expenses to Omaha. He was manager of our new business department and was sent there evidently on some business for the company. The next item Denver Gas & Electric Co. expenses F. W. Freauff $32.50 is probably at the time that we had Mr. Freauff here to assist by his services and paid his expenses. In the same month the item of Doherty expenses $31.60 is the same thing. In June 1908 the item H. Honeywell expenses to Omaha and Chicago, $75.00 indicates that I went to Omaha and then to Chicago to look after coal contracts. That is about the time that we made our coal contracts as a rule. Transfer voucher 557 $31.60

in June 1908 to Doherty, expenses, is probably an expense of the same sort connected with the charge for the preceding month.

987 The item of $40.00 in July, 1908, Homer Honeywell, subscription to Acme Amusement Company, represents the $40.00 of stock that was bought in that company, and is an asset of the gas company. They have had a couple of dividends. It is *is* a corporation operating three theaters here in town. The next item of $52.00 expenses F. W. Freauff Denver Gas & Electric Co. is the same sort of item I presume, as we had before. In August as indicated by the item F. W. Brown donation to Bryan fund $5.00, I suppose we gave Doc Brown a donation and I guess it was for gas making purposes. I presume the next item in September, 1908, E. Y. Grupe donation $20.00 was a donation to Grace Methodist Church of East Lincoln. He was very active in that Church. The next two items American Gas Institute dues $10.00 and Iowa District Gas Asso. dues $6.00, were the same sort of expenses as the others. The next item Doherty Operating Company, voucher No. 6937 Marston time and expenses $99.98 represents the expenses of an engineer we had here from Doherty Operating Co. to try to straighten us out. The name is familiar but I don't know the particular branch of the service he was in. He was a gas man of course, but I don't know whether water gas, coal gas, or what. I suppose the items covered by voucher 5286 Lindell Hotel Cafe. $12.15, $4.08, $17.32, $2.64 ball tickets 80¢ magazine subscriptions $40.00, total $37.40 was some entertainment over at the Lindell, either weekly meetings or visitors. Wherever the word donations appears, it represents or purports to represent some donation to a charitable institution. I cannot explain the next item voucher 606, $13.00 sundries, meter box $40.00 in October, nor can I explain the last item to W. C. Jenkins agent, subscription National Home Magazine $120.00. I don't know what it is supposed to represent. I don't know what transfer voucher No. 621-*d* Sundries, meter box, rent, $40.00 in November means. In December the item of $7.32 to the Savoy Hotel, indicates that we took someone to lunch there. I can't tell you how many there were. In December we sent H. C. Porter to Chicago to some convention and the item of $60.10 is his expenses. The next item to H. L. Doherty $31.30 repre-

988 sents Mr. Doherty's expenses while he was here. I do not know what the items "Edd Young, cigars, Adams, $7.50 Porter $4.00, Honeywell $4.00, total $12.40" covered by voucher 5930 were for. The item Lincoln Commercial Club cigars and lunch for Warner, Adams, voucher No. 5844 $7.20 is just what it purports to be I imagine. There was probably more than one lunch. The next item Lincoln Gas & Electric Light Co. contingent, Christmas gift for Rose, $2.00 B. C. A. Inc. $2.00, Glenn Marston $40.00 total $44.00. The $40.00 was some more expense of Mr. Marston that wasn't covered in the other voucher. The next item Kelly's cigars, Voucher 5836, for W. S. Whitten, $1.60 Mr. Cascaden $1.60, I think is for cigars given to those men. I left the company December 31, 1908. I do not know what the items of some $1,200.00 standing in my name and charged off the books about January 1,

1913, were for. I suppose they were vouchers and incidental expenses of management which had not been charged to the months as they should have been, and they were evidently in addition to the various items charged in this account which we have just gone over. It might be that they had been charged to me on the books for incidental expenses, that I had paid out during my management and were charged off in the early part of 1913 to balance the account, it having been carried on the books up to that time against me. I cannot explain why the account against Ed Bignell of $538.55 under date of May 27, 1908, was charged off as a bad debt. The reasonable excuse for Mr. Bignell being on the free list and getting gas and electricity free during the time disclosed here by the evidence, was that at different times Mr. Bignell had been able to help us out in the operating end of this property, a number of times and ways, for instance, I remember one time when fair time came on and we were short of steam in the plant and Mr. Bignell loaned us a Burlington engine to furnish steam. It stood on the side track. For favors of that kind in getting steam to us I think he was allowed free gas. The steam was used for manufacturing purposes. There was something wrong with the plant or we didn't have capacity enough or a boiler was out. I remember that
989 one time distinctly. There may have been more times than that. The steam that was used was divided between the gas and electric departments. I don't know how it was divided up, however. Also if we would get short of coal or anything of that kind, Mr. Bignell would get the coal moved for us. We also had a substantial electrical contract with the Burlington, but I don't know whether that went through Mr. Bignell's hands or not. We finally lost the lighting of the Burlington station to the traction company, but I think the matter of the contract was handled through Mr. Calvert. I do not know what was the cause of putting Thomas H. Pratt on the free list while I was manager. I didn't remember anything about it till I read it in the paper. The items covered by voucher No. 6000 October 28, 1905, Thomas H. Pratt gas $10.68 F. M. Prout fan $11.25, H. M. Eaton range $24.00 appear in the rebate account. As I remember Gen. Prout had a hot office in the Capital and we loaned him a fan and it was charged to him and when he returned it we credited it back. I do not remember about Mr. Eaton's range. Mr. Prout was Attorney General at that time and Eaton was Deputy Land Commissioner. Until reading the paper last night, I did not know there was a single consumer that was getting gas at less than $1.20 while I was manager. I don't think anybody authorized the reduction in the gas rates and I think whoever was the manager of the new business department slipped it over at that time. I don't know who authorized the placing of Mr. Bignell's name on the rebate list. I suppose I ought to know but it is too far back to remember. I have been out of contact with the company for five years. I wasn't putting someone on the free list or reducing rates every day. The entry on the rebate voucher for gas range delivered to H. F. Rose I do not remember anything very definite about it, but it is probable that we

gave him a gas range. It was pretty close to the time that he sold his house to Mr. Gooch. We gave most of the churches a gas range if they would use them for their suppers and there may have been isolated cases where somebody got one, but it wasn't a common
990 occurrence. We gave that range to Mr. Ruse as he was the attorney for the company and we thought he had rendered good services at a very small pay. I do not remember when Mr. S. H. Burnham was put on the free list but he had been able to render valuable services to the gas company in a financial way by his counsel. He was a member of the Board of Directors and got his director's fees just the same as the rest, but he was in a position where we could go to him on financial matters. The Board of Directors had nothing to do with the details of the management. They would come in and elect officers and look over the business. We consulted them in regard to certain methods of procedure at times and the wisdom of doing things at a certain time, but the real management was in the New York office.

991 FRANK W. FRUEAUFF, being first duly sworn, testified on behalf of the plaintiff as follows, pages 1007 to 1096, Vol. 1, original record:

Direct examination by Mr. Rose:

I was a witness in this case in 1907. Since then up till 1911 I was vice-president of the Lincoln Gas and Electric Light Co. and since that time I have been president. I am a member of the firm of Henry L. Doherty & Co., whose business is the operation, ownership, and financing of gas, electric, and street railway properties. We operate companies for ourselves and for others who have invested with us. We do the banking for these companies and float their securities. We operate about 108 different properties covering from 150 to 175 towns in the United States and Canada. A large part of my work has to do with the financing of these enterprises, and with the purchasing department and the accounting system. The accounting system used here by the company is our uniform system that we worked out several years ago and have modified it from year to year and used it in this plant and the other properties. Once or twice a year the managers of the different companies meet and suggestions are made and modifications and improvements worked out. We also run a school in which we teach engineers to be superintendents, managers, accountants, secretaries, and we are trying constantly to develop men to operate public utility companies. The interest of Doherty & Co. in the Lincoln plant is a minority interest but its interest, with the interest of clients and investors whom it represents, gives it a control of the company. The stock of this company is not owned by any of the Doherty holding companies because we have never felt that the Lincoln company was a fit proposition for a holding company. We could not recommend it as a purchase for
992 a holding company and we simply had to carry it as an individual investment. Since I have been here I have been endeavoring to educate the men of this company and to get competent

men here. We have from time to time financed the maturing obligations of the company and have endorsed their paper repeatedly, and have become their bankers. We arranged for the sale of the $500,000 worth of three-year notes to A. B. Leach & Co. We used the prestige of our firm to float these notes. We received no compensation whatever except our salaries. I visited the plant from six to eight times a year and I am in constant communication with the manager and in touch with its affairs. I have kept in touch with the organization and working force of the company and have considered it very efficient. I receive $2,400 a year as president. I think this is a reasonable compensation and feel that I earn it. Mr. Doherty is chairman of the Board of Directors. He has a very high reputation as a gas engineer and the reason our firm has enjoyed the success it has is due to his knowledge of the business. He has always loaned the facilities of his firm to the interests of this company. I think he receives $3,000 a year. I consider that a very reasonable salary for a man of his ability for the services he has rendered the company. I think it is a reasonable, necessary and proper expenditure and properly chargeable to the operating expenses of the company. These salaries are for the services rendered both the gas and electric departments. As to the apportionment of these salaries between the two departments, that is a very hard matter to determine for the reason that in recent years the greatest effort we have made has been due to the condition in the gas department, and at the same time we have kept in touch with the affairs of the electric department. My idea is that they should be divided according to
993 the relative size of the two departments. By considering the relative amounts of time which has been devoted to the gas department as compared with the electric department the proportion would be 20 to 1. At the time the employment was first made the salaries were divided half and half, but I am unable to say what the division is now. The expenses of our trips out here in connection with the company are paid out of our salaries. We are paying Mr. Adams, our general manager here, $3,600 per year. We regard him very highly, and fully qualified for the position, and his management has shown a great improvement in the character of the service. He has more than that, maintained as friendly relations with the public as possible and has given a good account of his management and kept the expenses as low as possible. Our company has a central purchasing or contracting department by which we are able to purchase supplies for the various companies which we operate at prices from 20 to 30 per cent better than the individual plant can obtain them because of the sizes of the purchases. We always give the company using the material the benefit of the advantage in price. No charge of any kind is made for this service outside of our salaries. The benefits received by the company from this policy more than counter-balances the sums received by Mr. Doherty and myself in the way of salaries. The amount paid Mr. Adams as general manager is a reasonable sum and necessary to secure a man to look after the property. Mr. Adams is a technical graduate of the University of Wisconsin, I believe, and he has had experience in other plants

before coming to Lincoln. He worked in a subordinate capacity here before he was entrusted with the responsibility of general manager. I am acquainted in a general way with the wages paid to the employees of the different departments here. We have found it from our experience that it tends toward economy and good
994 service to have trained men and specialists at the head of each department, and in my opinion the sums expended for this purpose in the local plant are reasonable and necessary. I would consider it a mistake to attempt to avoid this expense. We might be able to get cheaper men who would give poorer service. One of our greatest problems in the early days with this property was to bring it up to an efficient condition. It was in a very bad state. I have a pretty fair knowledge of the Lincoln gas plant and its equipment and properties. I have reviewed the inventories of the plant for some years and I am accustomed to dealing in these properties on a commercial basis. Our business is to acquire and later on operate a property and we sometimes build properties. I have a pretty good idea of the fair and reasonable cost of equipment of artificial gas plants, and have an intimate knowledge of the expense required in addition to the inventory valuations for the development of business, and of the patronage of such companies. The latter is one of the biggest items that we have in mind in the operation of a company. One of the elements we have to consider when we start to build a new enterprise is the cost of developing the business. In dealings in this country in gas utilities the developed business of the utility is regarded as having a definite valuation the same as the physical valuation of a property. The value of the mere physical property without the development of business would be hazardous property. It commands a definite price in this country as an operating part and I would take it into consideration in examining the property. In purchasing a property I think you could better afford to buy a business already developed than to attempt to *to* out and — create it with a newly constructed plant. In considering the replacement value you could not develop the business of a new plant
995 on that value sufficiently to put the invested capital on a fair earning basis without contributing some capital to the special purpose of developing its business. The mere fact that the mains and works were worth so much would not mean the total value because there must be a business to make the mains and works productive. If a new plant were constructed here in Lincoln the investment could not be put upon a fair revenue basis as a new plant without devoting some capital and contributions to your development of public patronage and a paying business. At the time the plant was first constructed and ready to engage in business there would not be any operating revenues from which you would be able to defray the cost of acquiring the business necessary to make it a profitable plant, as the revenue at that time would not be sufficient to take care of the ordinary running expenses. The cost of developing the business ought to be defrayed from the primary capital contributions as it is one of the elements. That makes the value and in order to develop the business the money would have to come from the capital. There

is no other source for it. This value is generally termed going value or going-concern value. That represents the difference in value between the dead plant and the live plant with enough business hooked on to it to make it profitable. We have a modified instance of this in this company. Two or three years ago we were induced to build into University Place. We extended our gas main and put in the service and equipped that district to have a gas supply. Up to this time the income from the consumers there has been considerably less than the investment justifies and we are trying to get that from a point of intro-ductive investment to a productive investment. In order to do that it is necessary to canvass and solicit and to present
the attractive features and to carry on a campaign of educa-
996 tion and that is what we have done here. The cost and expenses and outlay go beyond the amount of business done, and the business don't come in as fas- as the outlay, and until the operating revenues are an established fact our capital to carry on this campaign must be advanced, and it cannot be charged to operating revenues until they are in existence. It helps to make the dead investment alive and productive but you could never defray the cost if you were to charge it to operative revenue before it was realized. I have in mind another instance. I am interested in a food product. We have put about one hundred thousand dollars into building a plant to manufacture it near Chicago and we are now able to turn out all of the product that the market will need for a long time to come but we have no market. We are now conducting an extensive advertising campaign and have salesmen visiting the jobbers all over the country and we are familiarizing the people with our product, and we figure that by the time the proposition is on a going basis we will have in the making of the market four times the amount we have put into the plant, and we figure that our investment is the money that we have put in to make it a paying business. In some newspaper businesses as much as ten times the cost of the physical property is represented in the ability of the concern to dispose of the product of the physical property, and that value cannot come from, but must precede the operating revenues and must be provided for in the financial plan by primary capital contributions. When I testified before I gave my opinion as to the entire value of the gas plant here and I have kept in touch with the growth and development of the plant since that time, and I am now acquainted with the present fair commercial value of the Lincoln property with its business developed to the point which it has now attained. In my opinion $1,-
400,000 to $1,500,000 is the fair and reasonable commercial
997 or market value of all of the properties employed by this company in the gas utility in the city of Lincoln, which includes the stores and supplies and funds ordinarily and necessarily kept by the company to conduct this business and also includes the developed business of the company at this time. I know what rate of return is necessary to attract capital to gas utilities in the city of Lincoln and other like communities. In order to attract capital under normal conditions to gas utilities in the city of Lincoln which are subjected to the risks of business, a return of something better than 8% would

have to be offered to the investor and in addition there should have been earned something in addition to that to be set aside apart from the known reserve for depreciation for the unexpected. To pay out all of the net earnings of a gas concern for any year in the payment of dividends cannot be safely done as it would create an element of hazard which would destroy the credit of the enterprise. There are fluctuations up and down from year to year. In 1912 the earnings of our gas department were less than they were in 1911, due to the fact that the cost of gas making was about 5¢ per thousand more, and had we divided up everything we made in 1911 the showing of 1912 with less earnings would have crippled the standing of the company. It is peculiar to public utilities that the selling price is fixed while the cost of operation and up-keep varies from year to year. The labor and materials may go up but the price to the consumer is the same and the company assumes the liability of that fluctuation. In a matter so common as taxation a gas utility cannot count of meeting the same burdens from one year to another. Our experience here has shown that. We have had so-called occupation taxes levied which means much more of outlay. I know of no department of any gas company where the same expenditure can be counted on from year to year.

998 Cross-examination by Mr. Morning:

Henry L. Doherty & Co. is a partnership composed of Mr. Doherty, C. T. Brown, and myself. We have about 30 or 40 thousand dollars of the bonds of the company. The present bonded indebtedness of the company is about $1,500,000. We make our headquarters in New York City, and have no headquarters here except at the local office. I come here sometimes to attend the directors' meetings and sometimes in consultation with the officers about the policy and improvements of the company. Our company operates altogether about 30 gas plants or gas departments. In most of them I am either a director or other official. From some we draw salaries and some we do not. I do not draw a salary from more than three or four. Mr. Doherty also holds an office in many companies. I am unable to say from memory from how many he draws a salary. My total salary from the companies I do draw salaries from amounts to about $15,000 or $18,000, and I devote my services to all of the companies in consideration of those salaries. I am a practical gas man. My entire business experience has been in the gas business. I do not believe I would be able to qualify for the technical work of a general superintendent but I could advise him on some portions of his business. I preside at the directors' meetings when I am here and Mr. Doherty is not. The salary of $3,000 paid to Mr. Doherty is not paid to him to serve as chairman of the Board of Directors at their meetings. It is paid him for serving in an executive capacity and for examining and negotiating loans and securing contracts. We usually finance the loans through our company. As compensation I get nothing but my salary. Our company does that gratuitously. If we buy bonds we get interest on our money. The

$500,000 of notes sold in the last two years by Doherty & Co. to A. B. Leach & Co. were sold at 97, and we got nothing whatever out of it, and as a part of that transaction we advanced some bonds that we owned as security for the notes. All of my salary is earned because of the assistance I give to the company in financing it. Mr. Adams, I think, would have the qualifications necessary to act as chairman of the Board of Directors or as president of the company as to the local duties. In addition to the local duties it is necessary that the company have some one with ability to furnish capital and to purchase the supplies. I think the company here should pay for the expense of Eastern financial agents who finance the company and furnish capital and I believe that expense is a proper element to be considered in making a local rate in this city. There is a total paid of $9,000 in executive salaries. If Mr. Doherty lived here he would have the qualifications to perform the duties of president of the company, chairman of the Board of Directors and general superintendent, as he is a practical gas engineer. But he would not have the capacity to do the financeering that he does now because he would not be in a position to do it. He would not have the standing in the financial world if he confined his efforts to this one property, that he now has where he devotes his energies to a number of properties. He could not, as local president, secure the prices for materials and savings that we now secure, and neither could he secure the talent for the different districts under his charge as a local man without having other organizations to draw on. We are conducting at Denver a training school and each year we take on 30 university graduates and give them the practical knowledge that their college course cannot give, and when a man is needed at Lincoln or at some other plant one of these trained men is sent to do the work. We also conduct a school at Denver for training men in the development of business. Mr. Doherty, I think, in this property could not do these things which he is now doing with a group of properties. It could not be done without a very large added increase to the expenses of the local company. It is now done at the expense of Henry L. Doherty & Co. We consider it good management and economy in the operation of the plants. The president of the company could perform all of the duties of the chairman of the Board of Directors at the directors' meetings. In many instances the financing of this company could be done by one member of Doherty & Co. as well as two, but the salary of one would amount to as much as the combined salary of two, so far as the benefits derived are concerned. The company maintains an office in New York City for the payment of coupons. That is in our office. I am sure the company pays no rent for the New York office. In most cases a percentage fee is charged for the payment of coupons or the transfer of stock. I am unable to say whether that custom is maintained with reference to this company, but I will look it up. I make no charge against this company for any service in addition to my salary. Nor do I charge anything for my services in connection with this litigation. The prior hearing I might have charged my

traveling expenses if I was not at that time a salaried officer. At that time I was vice-president but did not draw a salary, and my recollection is that all I received for my services in connection with the prior litigation was my traveling expenses. In the purchase of gas ranges, electric incandescent lamps, fans, motors, water heaters, and such things, by reason of our having control of the large number of companies we are able to get better prices for supplies for the separate companies than they could get for themselves. We can also do this with gas pipe where we can buy from one foundry and distribute it to the different plants in that district. We were able to do this one or two times in connection with the purchase of pipe for both Denver and Lincoln, I think, prior to the last trial. We have also been able to do that in some instances in the purchase of coal, coke, and oil. Doherty & Co. does that in all
1001 cases where it is found that better prices can be secured. Doherty & Co. purchases for the Lincoln Company, gas sets, electric lamps, fans, sundries and some gas supplies, and sometimes we buy gas pipe for it. Other times we tell them the prices we are able to secure for them and they order on that information. Our purchasing depends upon whether we are able to get a large enough volume of orders from the different plants to get a special price. In case of the purchase of a portion of gas pipe by the local company the local company would take it up with our purchasing department and they would find out what was the best price obtainable for the material needed and frequently they are able to secure better prices and the local company gets the benefit of it. At the time the 500,000 foot holder was purchased for the Lincoln company we also acted for another plant and placed the order for two holders and thereby got some concession in price. This has also been true of coal and oil in some cases. Doherty & Co. are holders principally of stocks in the various companies and oftentimes own notes for money loaned. We also sell securities in gas company and public service corporations. The income of Doherty & Co. is largely on the stocks that it owns. Our holdings are both direct and by means of holding companies. We sometimes also own small amounts as individuals but the firm ownership is practically all that we have. No profit whatever is made by Doherty & Co. on the various purchases which it negotiates for the different companies. In the case of the purchase of meters the purchase is subject to a quantity discount at the end of each year. When that discount is paid to us it is divided up among the companies in the proportion they have bought. I don't think of any instance in which Doherty & Co. is in any way interested in any of the firms or corporations with which the contracts for the different supplies are made.
1002 There is one instance where we own and run a small plant in Brooklyn manufacturing a special gas burner, and sometimes we order a few of those things but that is not a paying proposition and we are not getting any profit out of it. That is another company that we are trying to get on a going value basis. Under general conditions I consider the gas business a safe business and usually less subject to hazard than industrials and also electric and

steam railroads. Exhibit 17 is a table put out by our company by which we intended to show that fact. It is based upon a study of the data that we were able to get on the various lines of business over a period of about ten years, taken from the country at large and confined to the companies we were interested in. I consider it reasonably correct having regard for the average conditions in the various groups. Exhibit 18 is a document put out by Doherty & Co. advertising especially gas and electric securities of the company. In that we made a special point of advertising the gas business under general conditions as being one less liable to hazard and usually business risks than any other line of business. Even in the gas business you would have to push for business or you would not be successful. The absence of wood or coal for fuel anywhere near the city of Lincoln not only makes gas a desirable fuel but also a very expensive thing to supply it. If there were no gas company in Lincoln and no means of obtaining gas there would be some existing demand for it before the company was launched. We built from Lincoln to University Place, a distance of three or four miles through an unsettled territory and are not now getting what we think we ought to. We thought it would be cheaper to build this way than to erect a new gas plant at University Place. It would take from two to ten years after the establishment of a gas plant in Lincoln for the revenue of the sales of gas to pay the operating expenses. It is not probable that
1003 the demand would be so great that we would be unable to lay the mains fast enough. We have not found that to be a fact in University Place. I see no distinction between University Place and Lincoln on this proposition. Our business here is largely serving residences. We charge in University Place $1.25 per thousand. In building up a new business capital would have to be advanced to make up the deficit in operating expenses. We would not be able to charge a rate which would pay expenses because the public could not afford to pay it. We try to get it adjusted on a paying basis as soon as possible. The highest rate this company has ever charged, to my recollection, is about $1.50. That was at the time of the reorganization along in 1892. A portion of the expenses necessary to build up the business might be paid out of the earnings if there were any available but as a matter of fact at the outset there are no available earnings. As far as possible the income would be used to defray the expenses and the rest of it would have to come from capital. Since 1901, at the time the McMillan syndicate took over the property, the expenses of operating the business and of getting new business has, as far as possible, been charged to operating expenses, and has been paid out of earnings which should have been allowed to accumulate by reserve or by moneys borrowed for the company and put into the business by the sale of some of its stock. The expense of soliciting has always been charged to operating expenses and we also allow salaries. It has always been that there was enough income to pay current expenses. All of those expenses are entered here as part of the operating expenses and deducted from the gross earnings before we arrive at what the company considers a fair return. I have drawn a salary since 1911. Prior to that time I drew no

salary. Mr. Doherty, I think, has drawn a salary since 1903 or 1904. He was formerly president while Mr. McMillan was
1004 chairman of the Board. I will ascertain whether or not Mr. McMillan drew a salary. The food product I referred to is what is known as a national onion salt. It is a quanity new to the trade and we have to create a demand for it. I think that is also true of gas as our University Place experience indicates. Gas is pretty well known but when we go to a house-holder we find his knowledge is limited. We sometimes get him to install a gas stove in his kitchen which he uses for two or three months in the summer time and it is sometimes five years before they will use gas for cooking. It is a problem to get them to see the comparative value of gas as a fuel and it takes time and effort. I estimate the going value of the Lincoln property at from $300,000 to $350,000. The balance of my estimate is the value of the physical properties. I figure from 70 to 80 thousand as working capital, which includes materials on hand and cash in banks. It is ordinarily necessary to have from 30 to 40 thousand on hand. The amount of cash in bank on January 1st, 1913, of $55,920.39 is very much more than it has averaged for any recent period. On December 31st, 1912, the company had on deposit with Doherty & Co. in New York City, $27,445.89. They carry a balance with us to meet coupons when presented and to meet obligations. We pay them six per cent interest on their deposits. We try to divide our banking business in the communities in all banking institutions. We never try to do all our business with any one. In a month or two all of this cash on hand will be put into some extension or enlargement. I think this is the first time we have had that much cash on hand. The money on deposit with Doherty & Co. cannot be any portion of the proceeds of the sale of the $500,000 of notes in 1911. That was all used to clean up the floating in-
1005 debtedness. The policy of the companies is to leave their funds in the local offices. However, all of the companies do carry a deposit with Doherty & Co. primarily for paying dividends and coupons. We charge them six per cent for the money we advance and pay them six per cent for the amount they deposit with us. Most of the properties are owing us, and the Lincoln property has until quite recently. The earnings of the gas department in 1912 were about $9,000 less than in 1911. I am unable to say whether the expense of this litigation has gone into that period or not. It will have to be charged off. The competition from coal companies is greater here than in many places. I think the records will show in the price fluctuation there has been a rise in the cost of gas-making materials during the life of this property while there has been a decrease in the selling price of gas. There has been an increase in the sales of gas but also an increase in the cost of bringing about those sales.

Redirect examination by Mr. Rose:

The bonded debt of $1,500,000 is the outstanding debt of the company representing both departments. If the $500,000 of notes were

paid the outstanding indebtedness of the company would be between $700,000 and $800,000. The exact figures would be about $760,000. Mr. Doherty is consulting engineer of the company on all matters and it receives the benefit of his engineering skill and experience. He designed the spray used on the gas machine. Very frequently independent companies hire independent engineers and operating companies as managers and employ them on special engineering matters and employ special auditors. It is a good thing to get the advice of others who have had experience in like matters. J. G. White & Co. is an engineering and operating company operating all over the world. They accept employment as consulting engineers and general managers of individual plants in the United States
1006 and Canada. There are also Stone & Webster, Westinghouse, Carr & Co., and H. M. Billsby & Co. These companies and Doherty & Co. are the principal ones in that business and we do no outside engineering for others. It is my understanding that the people owning this company prior to Doherty & Co. being connected with it actually solicited and placed the property under the general management of Emerson, McMillan & Co. The services rendered by Mr. Doherty and myself were of the nature of the services of a skilled consulting engineering company and largely without additional cost to the company and correspond with the services which might be furnished by an outside engineering concern. Prior to Doherty & Co. taking over the matter, Emerson, McMillan & Co. has always acted as their company's transfer agents and always charged for the services. The charge for that service is practically unavoidable if your securities are to be put through the New York market. The charge is done to defray the expense of making the transfer. We worked out the cost once and have always charged that since. We have never made the practice of buying properties and selling them at a profit. We make it our business to purchase properties and develop them. We are not speculators. In exhibit 17 showing the increased rate of earnings applicable to these utilities there is no separate grouping of gas properties. The compilation was from the data of both gas and electric properties, the larger part of the increase came from the electric depart- as there are more new uses and possibilities for electricity at the present time. Both departments show gains but the electric department has grown faster. There are more uses for electricity for lighting and power purposes than there are for gas. Exhibit 18 is prospectus on city service companies. The Lincoln property has no connection with the city service company. The Lincoln property does not compare with the properties embraced in the city service companies. I would consider it a bad property
1007 as compared with those properties. We would never undertake to exploit by an honest prospectus the performance of the Lincoln company from a revenue standpoint. There is nothing that we can point to as a recommendation to an investor. I am unable to see any difference in the value of the Lincoln plant or any other utility whether it is valued for the purpose of selling or fixing the rate for assessment for taxes. Utility companies have but one basis of value for all purposes. Our company advocates that there can be but one

value for all purposes and, in my opinion, that is the only standard that you can have.

Recross-examination by Mr. Morning:

The $500,000 worth of notes recently issued were for the purpose of taking up $333,000 worth of bonds and the floating indebtedness. After this was taken up I do not know whether or not there was a surplus. Mr. Adams can tell you that. Interest is being paid at the rate of 5% on the bonds and 6% on the notes. So far as our records go the interest paid was not apportioned. We accumulate so much from each department and make a deduction from the accumulation. I would say that the electric business is much more profitable than the gas business but exhibit 17 and 18 don't emphasize that point. They emphasize the growth. We have competition in the electric business in Lincoln. When we first started in we did a commercial business and also street lighting, then the city came in and did their own street lighting and we lost that income. Then the street railway company has an electric department and are competitors with us for commercial and power business. We are constantly competing with them for the business. I think our net earnings for the year 1912 in the electric department were $35,000 or $36,000. These were applicable to depreciation and returns on capital. I have made no particular effort to place a value upon our electric plant but my general impression is
1008 that it is worth somewhere between $600,000 and $800,000.

I do not thing we would be earning more than 1% on that valuation after making a reasonable allowance for depreciation. We deduct from between 5% and 7% of the gross earnings for depreciation. Our office is a sort of clearing house for information for the various companies. I think it is very desirable that a gas plant, after it has been constructed and it is in operation, to keep in its employment a consulting engineer for you are constantly investing new money. Each year there are improvements to be made, additions, and enlargements to be added, and money spent for engineering services and advice. A practical gas man like Mr. Adams would have a great deal of knowledge along these lines but in this business two heads are better than one and suggestions are secured through our method from outside sources which may save errors which Mr. Adams might not see. When we constructed the East Lincoln holder a great deal of engineering advice was required to determine whether it would be more efficient to construct it in East Lincoln or to put it at the gas works. These are very complicated problems in the gas business. My impression is that that problem was solved by our experience in Denver where the same thing was done. Mr. Adams could get that information in a general way but he would not get it as definitely as he could if part of the organization were working toward that end. Individual companies employ operating or engineering companies to exercise much the same control over their plants that Doherty & Co. does over this company. New York City at the time its affairs were made public

had a number of consulting engineers on its pay-roll to do this very work. Chicago has done the same thing. The gas company at Galveston, Tex., pays a consulting engineer an annual retainer rather than a particular fee. Smaller plants also do the same thing. Money spent in this way is thought to be money well spent in every public utility property. The problem of enlargement
1009 and growth is continually before it. In a great many instances gas plants over the entire country are controlled by a company such as ours, by ownership of stock. That has been frequently the only possible way of financing the needs of those companies. An institution that has its money already don't need the assistance financially but it might need the services from an engineering or advisory standpoint. The transfer service mentioned takes place when a holder disposes of his stock. The transfer office receives the stock of that man, takes up his certificate, and issues a new one in the name of the buyer, and registers that on the record to show that he is the holder of record. This work is not ordinarily done by the secretary of the corporation and is done outside as a protection against over-issue. Mr. Phillips, a local man, is secretary of the company. The practice is for the president and secretary to sign the stock in blank and turn it over to the transfer office to issue as needed. The transfer fees of Doherty & Co. from the local company here amounts to ten or fifteen dollars a month. It is the same charge that was formerly made by McMillan & Co.

Cross-examination continued by Mr. Foster:

I saw the inventory that was made some years ago in the first case and I have made some study of inventories made since. I remember seeing Mr. Lea's last complete inventory and report. I have seen some of the data gathered in the office. For the last three or four years the quality of the company's product has been about the same. The fluctuation of our expenses is in the operating department. Our general expenses have not fluctuated greatly but we have had some unusual expenses once or twice. Our general expenses have gone up for the last few years.

Cross-examination continued by Mr. Morning:

At the time McMillan bought this property I came here and made the entries, opened the books of the new property, and closed
1010 out the accounts of the old. I was not a party to the transaction but was acting in a clerical capacity. I think they got some idea of what the property was before they acquired it. I don't know whether they had an inventory or not. The transfer was in the nature of a stock and bond transaction rather than a cash sale. I think the capitalization was increased materially with some new capital put in. I do not know how much. The books will show and they are here.

Redirect examination by Mr. Rose:

It used to be considered the best method to place the holder capacity at the manufacturing plant. Mr. Doherty personally figured on it, and found it desirable to do it the other way, putting in district holders and giving the same service with a lower investment. It has been a custom and had generally been considered that 4-inch cast iron mains were the smallest that you could use for service to perfect economy and many modern towns over the country use the 4-inch cast iron mains as the minimum size. Doherty & Co. have worked out a plan of having large trunk feeders carrying the gas out to the smaller mains to distribute it among the users. By having district holders instead of a central holder your investment is smaller. The gas can be supplied out of the district holder in smaller mains costing less to construct and the district holder can be filled from the central station by one trunk main. When the consumer is not drawing gas it can be sent through the trunk main to the holder and when the customer does use it, it comes from the holder. This tends to give a uniform pressure. By these two methods we have been able to serve the community at a lower investment cost and relieve the service from the burden of paying a return on increased capital. The present plant constructed with district holders would not be ¾ of what the distribution system is in some places where they put in big pipe all over the system
1011 with the central holders. These results do not come from a single plant but are the result of a study of a great many places and conditions. We think that it is of a decided advantage to have the services of an engineering company that makes a comprehensive study of the whole industry.

Recross-examination by Mr. Morning:

The idea of the district holder and elimination of large trunk mains is very nearly an original idea of Mr. Doherty. He broke away from the established custom and worked it out. I do not mean to say that there was never a district holder before he went into the gas business but I do mean that he developed the idea of district holders for storage purposes rather than having them all assembled at the point of manufacture. That method was first employed elsewhere at Mr. Doherty's suggestion, and at that time was a matter of public knowledge among gas men and engineers. They could have adopted it here independently of Mr. Doherty but I doubt if they would.

Redirect examination by Mr. Rose:

The 2-inch wrought iron mains have worked out very satisfactorily here and it materially decreases the cost of plant construction and it is more than sufficient to counter-balance the longer life of a 4-inch main. It avoids the loading of a larger capital return on the plant.

Recross-examination by Mr. Morning:

Prior to the installation of the East Lincoln holder the plant here had an excessive amount of 2-inch mains and had resulting trouble from inadequate pressure. When this case was tried in 1908 the East Lincoln holder did not exist. The holder was not constructed because we had long lines of 2-inch mains but because we didn't have enough large size mains to bring the gas to the 2-inch mains and the question was, should we put extremely large mains in to take all the gas when needed to the 2-inch mains or shall we take it through smaller carriers. If I were installing a new plant
1012 I would put in the East Lincoln holder in preference to laying mains of a larger size to the territory served by that holder. Since the last trial we have spent considerable money for service governors for the purpose of maintaining a uniform pressure at the service. It was partly due to the excessive pressure required to force the gas through the smaller mains to the outlying territory which increased the pressure upon certain of the services during different periods of the day, but the idea of putting on the governers is one of the features in connection with the whole system. The governors cost about $10,000. The East Lincoln holder is tied into the whole system. It is the place where the engineer figured it best to locate it on the system. One of the reasons was to give the necessary pressure to send it out to University Place and Havelock. We have a booster at the holder which is used to send the gas all over the system and towards University Place. My recollection is that the East Lincoln holder was necessary without regard to whether we built into University Place. We have another district holder at the gas works. As I recollect it the weak point in our system from the standpoint of locality was the location of the district holder. I consider our investment here in the distribution system low per thousand of gas sold.

Redirect examination by Mr. Rose:

The installation of a district holder would create less interruption of business and cause less public inconvenience than the changing of large mains for smaller ones. It becomes less and less practicable as the city grows to regulate the pressure at the service by an adjustment and change in size of the supply mains and the cure is by the use of governors. If the difficulty of uneven pressure were attempted to be over-come by an enlargement of the mains it would increase the cost at a greater rate than by means of small mains, district holders, and governors. Governors are coming to be a recognized necessity in all gas plants. It is impossible to obtain uniform pressure in any other way.

1013 FRANK W. FRUEAUFF, recalled for further cross-examination, testified as follows, pages 1134 to 1147, Vol. 1, original record:

Cross-examination by Mr. Morning:

My testimony as to the necessity of the East Lincoln holder was based upon recommendations and data placed before us either by engineers here or others we sent here to study it. C. A. Frueauff is my brother. He is an attorney in New York, and is paid a monthly retainer of $50. It is his duty to advise Mr. Doherty and myself and to advise the Lincoln company in different matters. At the time of the note issue he prepared the note and passed upon the character of it. We find it necessary and economical to have a New York attorney at $50 a month. The salary is charged to the local expenses of the property here. H. H. Scott is general manager of the Doherty Operating Co., a corporation which is formed to handle some of the engineering and statistical affairs of Doherty & Co. He is not on the pay-roll of the Lincoln Gas Co. The charge of $60, on January 1, 1910, against the Lincoln Gas Co. for the salary of Mr. Scott was for his time devoted to the Lincoln company. It represents a portion of his salary. When these men come out and do some special work for a property their time is charged to that property. This is covered by voucher 8001. We do not make any charge for stationery used in the New York office on behalf of the Lincoln company. The charge there for stationery is, I think, some that was prepared and sent out here. The premium of $1,500, April 20, 1910, of the National Surety Co., I think, is the premium that the company had to pay on the bonds in order to maintain this law-suit. It was charged to the operating expenses and paid out of the earnings. In addition, Doherty & Co. have to stand the sponsoring to the surety company on these bonds, for which Doherty & Co. receives no pay. My brother was paid a fee for services in connection with this case on appeal to the
1014 Supreme court. I am unable to say what it was. That was charged to the operating expenses and paid out of the earnings. In addition, Mr. Strode and Mr. Rose are also paid. Mr. W. H. Gardner is one of our men from New York. We sent him around once to nearly all of the properties to go over some items in our accounting and reporting system, and voucher 11,565, of December 1, 1911, for $31.54, represents, I think, his expenses while here. The item of $10 represents his time. The commission for paying interest on bonds is ¼%, and the item of $47.94, December 1, 1911, voucher 11,774, is the charge made by this company as fiscal agent for paying interest on bonds. Voucher 12,463, April 4, 1912, for $15.33, is, I think, the local company's contribution toward a general advertising campaign to popularize the electric vehicle. I am not certain about that. Paul R. Jones is general auditor for Doherty & Co. He goes out once or twice a year and audits all of the properties for the stockholders. He is paid a salary by Doherty & Co., and the item of $125, January 31, 1912, to him is for an audit of the local company's books. The item of

April 30, 1912, for $220, to him for 11 days is for his services in connection with the audit of the books of the company. The item of $3.25 of April 27, 1912, is for stenographer's work. I do not know just what it covered but it was probably something special that came up. Voucher 12,764, June 1, 1912, for $47.94, is for commission for interest on bonds. The item of C. B. Gilbert, of $25, for April and June, is for his salary. He is assistant secretary of the company in New York. I consider him a necessary adjunct to the transaction of the company's gas business here. He is on a regular salary from Doherty & Co., and it is pro-rated out among the different companies of which he is an officer. Mr. W. E. Quillan is manager of our general commercial department. He visits the different properties and calls to their attention new methods of securing business and helps stimulate the growth of business.

1015 Whenever he visits a property his time and expenses is charged to that property. The item of October 1, 1912, voucher 13,250, to him for $29.70, is the pro-rate portion of his expenses while on one of these trips. The item of October 1, 1912, for $100, advanced to Mr. Adams, was advanced to him while he was in New York. Mr. Gilbert acts as assistant secretary for four or five companies. His duties are along that general line. The item of December 1, 1912, voucher 13,526, for $42, to Columbus stock transfer agent, is the fee paid to the transfer agent in New York on Columbus, Ohio.

1016 *Stipulation.*

It is stipulated by and between the parties that the City of Lincoln through the City Attorney and his associates has secured an order from the District Court of Lancaster County, Nebraska, setting the case of the State of Nebraska ex rel., Frank M. Tyrrell vs. The Lincoln Gas & Electric Light Company for trial over the objection of the company immediately after the conclusion of the taking of the evidence before the Master in this hearing and the City is demanding an immediate trial and judgment in that case according to the prayer of its petition.

It is further stipulated and agreed by and between the parties that on December 27th, 1912, the following proposition was submitted to the electors of the City of Lincoln embodied in an ordinance, to-wit: (For copy of ordinance see Exhibit 102.)

1017 L. E. WETTLING, being first duly sworn, testified on behalf of the plaintiff on rebuttal as follows, pages 4059 to 4091 Volume 4 original record.

Direct examination by Mr. Rose:

I am a public accountant. In my employ with the Nebraska State Railway Commission and under the Attorney General for Nebraska, covering a period since 1906, I have had much experience with the analysis of accounts of public utilities and with analysis of valuation figures and contentions generally that come in litiga-

tion and hearings on matters of that nature, before the commission and before the Courts in several rate cases and tax matters. In connection with my professional business I have had access to the original records, accounts and vouchers of public utility companies as well as the exhibition of that information in hearings before the commission and the Court and also in the performance of my duties I have had occasion to refer to tax books law books and reports of commissioners in various states in the union generally. Shortly after the organization of the Nebraska commission, I was employed there first on a per diem basis, and prior to that I had been employed by the attorney general to assist in tax matters and express and railroad rate matters. I wrote the amicus curia page in the Missouri rate case and my work was utilized and embodied in the arguments submitted at that time to the Supreme Court of the United States, in that case. I have been following the vocation of a public accountant almost all the time since 1895. For about eight years I was regularly connected with the Farmers and Merchants Insurance Company and did not follow the business as a vocation, but I did considerable accounting both here and in Omaha. My first employment by the Farmers & Merchants Insurance Company was in the capacity of a public accountant for the purpose of analizing their accounts and submitting a report as to the values of the securities and the condition of the business generally and in several cases of considerable magnitude in connection with my employment by that company, I was called upon to perform the duties of
1018 public accountant and made an examination for the purpose of a possible purchasing of a number of insurance companies, and during the same time I completed an examination of the affairs of the Auditor's Office of the Pacific Express Company and there was also considerable litigation with the former Secretary of an insurance company in Omaha, in which I did a very large amount of accounting work. The Farmers & Merchant's Insurance Co. was an investor in the securities and stock of the Lincoln Gas Company at that time and they were represented on the Board of Directors. I became its representative about 1902 and am still a director on that Board. I have attended the meetings of the Board of Directors and have kept in touch with this utility in a very general way. I haven't made a very close analysis of the amounts, but I have kept in touch from time to time ever since I became a director. I have made considerable study along the lines of valuations, incidental to the question of the accounting, as in rate controversies and litigation, and during my term of service with the Nebraska commission I have always worked in conjunction and close touch with the engineering department. Our work merged to some extent and I did some little independent investigating and occasionally had some opinions along the lines of general practice which disagreed with them. I have made a study of the different engineering problems in so far as they enter into the items of construction, financing and operation of public utilities and have compared all of the items of cost entering into the giving of service and have made a study of what items of cost are proper capital contributions

and what are legitimate and strictly operating expenses. I am familiar with the practices and different theories which obtain in valuing a property as held by engineers, Courts and commissioners, and public utility companies. An inventory of the material in the composite plant would not necessarily reflect the cost of construction. It would depend largely upon the conditions at the time of the valuation as compared to the conditions at the time of the con-
1019 struction or purchase. The question of variation in labor costs, material cost and the possible difficulties of construction they might have elsewhere in the interim and a number of other minor reasons might affect and make up the difference between the two items. The materials actually in place in any business utility plant seldom represent all the materials that the company would necessarily have to spend its money for in acquiring the plant. It is not as a rule a practicable possibility to show all the materials necessary to be purchased and actually standing in a completed plant, except where the article is complete in itself and there is always in practice more or less loss of materials, disappearances for various reasons and the amounts will seldom be found in re-inventorying, and it has been the experience in making inventories of plants which have been constructed during a period extending over a number of years, that an inventory is seldom taken which does not and ought not to account for a number of omissions. It is seldom that an inventory is absolutely complete. It is almost impossible to avoid omissions in the ordinary course and there are generally variations made on that account. In a plant which as a whole is composed of a large class of items or containing a particularly large collection of smaller items, it is impossible to account in the construction finally turned over, for a working plant, for the total amount of material purchased, and for that reason it is the common practice and has been found practicable and necessary to make an allowance for various percentages for contingencies. The term contingencies and omissions covers also other things. It has a varying interpretation by different engineers and does not always include the same items. It generally includes the loss of material, breakage of material, unfor-seen accidents unfor-seen difficulties, met for instance if the contract is based on the trenching through a certain kind of earth and they should meet hard pan or obstacles that were not figured on in the original estimate. It also covers possible accidents during construction, damage claims and things of that kind.

1020 Also covering pilfering, stealing or loss of material and tools and whatever else disappears from other causes than pilfering. These items represent actual costs experienced by builders. Sometimes the cost is not quite so great as the allowance or estimate and sometimes it far exceeds it. From three to five per cent would be a reasonable allowance for contingencies for covering the actual costs in the construction of a plant like the Lincoln Gas & Electric Light Company's gas department. I only speak from general knowledge of what has been done at various places and plants of different kinds over the country as reported. I am at present a mem-

ber of the firm of Hurd, Gerber and Wettling and our offices are in the First National Bank Building of the city. In my estimate of three to five per cent contingencies and omissions I do not include any item for casualty liability. That is generally considered as a separate and distinct item. When I said accidents as a matter of contingencies, I referred to accidents to materials, such as breakage which occurs in putting a great many small component parts together or accidents to the works such as cave-ins and things of that kind. There are actually expenses experienced in the construction of a work of the magnitude of the gas company's plant, on account of casualty liability. The risk in building public service plants like gas and electric plants, street railway plants, telegraph plants, as to the question of personal liability for injuries and damages, it is almost the universal practice to insure against cost of that nature by taking out liability insurance as well as insurance against accidents and liabilities not coming from the actual work itself. The amount set aside for this varies somewhat, with the class of work and the basis that these liability insurance companies figure on is a percentage of the pay roll and the varying of rates charged is in accordance with the work done. In the job that has a small liability that runs from one per cent up to as high as five per cent and even as high as ten per cent of the pay roll but taking it as a sort of general
1021 average it runs from four or five per cent on the pay roll, and assuming that the labor cost constitutes practically one-half of the entire cost of the finally installing the plant of the gas company here, it would amount from two per cent to two and one-half per cent. That is an item that is recognized by engineers generally and by public service commissioners and by the Court as a necessary part of the capital expenditure and it is either directly or indirectly always allowed with very few exceptions. In the construction of a plant like that of the gas company, it is also necessary to employ engineers for supervision as the work progresses. It is a well recognized fact that no gas plant of any magnitude or any prospective magnitude is ever able without the assistance of engineers, to construct the plant. There is first the preliminary work to be done in the matter of surveying the field and determining the best location for the plant itself and the best location for the distribution system and the general outline. That is studied with reference to the population centers, of the place itself and it is compared to other places and generally involves a long and extended study. That is usual and ordinary by engineers who have specialized in that particular line, especially where the corporation proposes to build a plant of this nature. They would only secure engineers who have had particular experience and undoubted ability and integrity in that line of business. This item is almost uniformly recognized by rate commissions and Courts, in the making up of estimates of the values of the corporations under consideration, and such expenses are unavoidably and necessarily a capital expenditure, because there is no other fund to draw from. Until the plant is in working order, there is no chance to draw from other funds. In the construction of a gas plant having a physical equipment of the approximate value of $1,000,000.00 I should say from my general

knowledge that five to eight per cent would have to be allowed for engineering and supervision together. It depends to some extent upon the difficulties met with, the length of time that is taken to do the building and the amount of preliminary service and investiga-
1022 tion necessary and the rapidity with which the plant is built and the money obtained for the protection of the building. All of those things would necessarily enter in, but just what particular weight each of those factors would have, would be difficult for me to state. With respect to the omissions and contingencies, I have ready in mind two instances that came under my direct observation the past year. In the case of the Lincoln Telephone & Telegraph Company, the engineers for the commission made an allowance of 5% for contingencies and adopted as a basis for making the value, an inventory submitted by the company itself, which purported to show all the items entering into the construction of the then physical plant. They checked approximately one-half of the entire distribution plant and office plant and found in that one-half omissions that practically equaled the 5% allowed on the entire property, and it indicated that 5% allowance was in fact only about one-half of the actual omissions that they had met with in the inventories made by the company. The companies in York County and Johnson county submitted inventories also and the unit basis applied by the department resulted in an estimated value of the plant from those figures submitted by the engineers. The occasion came up a little later for a more careful investigation, and in checking at random, here, there and elsewhere in parts of the plant, they found actual omissions of wires, poles, cross arms and various portions of the plant, which if they had been carried into an investigation of the entire plant, indicated that the allowance of 5% for omissions and contingencies would not have been sufficient to cover it. This was the result of the actual checking of visual physical property by third persons who did not take the inventories. They were checking inventories taken by someone else.

When a dead plant is constructed, there is a capital expenditure required to convert it into a live plant. That is true in practically all lines of business, public utilities as well as others, and that is the amount that it is necessary to expend to establish the business
1023 itself and to turn the plant from a mere physical property into an earning property for the stockholders and investors. That amount at present and for some years past has come to be designated as going concern value as distinguished from the physical plant itself. In addition to that there is the item of working capital, which is necessarily a separate and distinct item from the physical plant and is just as necessary as the plant itself. There is generally recognized and known by engineers, commissioners and Courts an item of expenditure to compensate for corporate organization. Sometimes that is included in one item, but more generally it is included in with the so-called overhead charges for engineering supervision and contingencies. That is the most usual place to allow it, and constitutes all the necessary expenditures for making estimates; obtaining money, soliciting funds, promoting, articles of incorporation, examination of abstracts, legal advice, purchase of franchises wherever

necessary and all expenditures of any nature which are preliminary to the actual business, or in many cases to the actual commencement of the building or plant, and they don't enter into the physical plant itself, nor would they be found as such in the inventories of the physical plant itself. These are just as necessarily a part of the primary capital contribution in a well conducted and carefully planned organization as the purchase of machinery itself. It is usually necessary for the promoter, when an enterprise of this kind is entered upon, to establish an office, at least at the beginning of the work of construction, in the community where it is being carried on and he must necessarily surround himself with the necessary help to generally supervise and look after the work of construction and he must have assistants to see that the work is prosecuted under the plans laid out by him. He must have a pay master and an accountant and they are in addition to the work done by the contractor or the engineers and the engineers' supervision clear through the construction. It is necessary to have an organization of this kind clear through the period of construction until the whole work is taken over and the plant is ready to operate. The expenses of that
1024 organization is necessarily a charge to the primary capital, because there is no other source of obtaining funds to defray each expenses. These expenses preceding the establishment of the operating revenues and the establishment of such an office, involve rent, stationery and supplies and probably would include traveling expenses, depending on the conditions, whether or not it was necessary to go to the source of supplies and investigate and make contracts for machinery or possibly to the source of supply for obtaining funds for capitalization. It involves everything that is incidental to making the local office itself efficient for the purpose for which it was established. It might include traveling expenses and it might not include that. It would in the case of the gas company. The gas plant would have to be operated at a loss in actual practice. It would be unavoidable. Also in the case of the gas company or almost any other class of utility, it is necessary to put out solicitors or educators to solicit business and to impress upon the present patrons the advantage of the use of the utility proposed to be established and acquire, with more or less rapidity, the business which that company proposes to do. I know that it costs from $30.00 to $40.00 per customer to get consumers to take the gas and to continue using it. That expense always exists to a greater or less extent in every new company. Until the utility develops a fair revenue this expense has to be charged to the capital account and it must necessarily be paid by the investors either directly or indirectly. If the capital subscribed and paid is not sufficient over the amount of actual needs for the building of the plant, including overhead charges, that is the building of the plant and working capital, then they must either contribute more money to defray such expenses or the company must borrow it and afterwards repay it out of the earnings. Even if it is borrowed it would represent capital expenditure. Bills payable are as much capital while they are on the books as the stock subscribed for or bonds sold. After the company got

on a fair revenue basis it would not be equitable to the present
1025 consumers to charge the original capital expenses for developing the utility into the operating expenses. The practice sometimes has been to charge those expenses off in a long period, but it is in effect the same as capitalization. It enforces upon the consumer for a shorter time a larger charge, than if charged on the basis of capital on investment. At the start there is no source of revenue to defray that cost to the capital contributors. It is not only impossible to charge these expenses against operating revenues when they are not sufficient to meet the operating expenses, but it is also unfair to charge them into operating revenue until after the operating revenue is large enough to not only cover all operating expenses, but also a fair rate on the investment. I have never made a calculation of the going value of the Lincoln Gas Company plant that is absolutely scientific or what I would consider a proper calculation, only in a very general way. I would want to know definitely that amount of dividends that have been foregone by the investors in the past, and the amount of expenses met in some of those directions in advance, but lacking the ability and time to get that information I have made an estimate which is of course, rough, but on the basis of obtaining the consumer. Estimating that at $30.00 per consumer, I figure about $240,000.00 or $250,000.00 for going concern value in the Lincoln plant.

Working capital, generally interpreted, means that amount of money necessary to keep on hand in order to pay operating expenses in advance of getting returns for the sale of the commodity. For instance, if you are running as in your gas plant, you pay your men at the end of each week or the month or in the middle and at the end of the month and you pay for your coal, oil and supplies as you buy them from time to time and your revenue from the business which pays for those supplies does not come to you until from fifteen to sixty days after the product is manufactured and delivered and it is necessary to have the capital with which to meet these costs and
expenses, in order to pay it and keep up your credit and get
1026 the advantage of the lowest cost of material and labor at the same time. It is also necessary to keep stores for repairs and replacements in advance and also if your business is being carried on, which is usual and customary for gas companies, all over the country, it is also necessary to keep appliances, stoves and supplies of that nature on hand. You are also required to keep on hand a reasonable number of meters, depending upon the ratio of the growth, but you must necessarily have some in stock, because if a customer comes today and says he is ready to take gas tomorrow, you can't wait to send down east and bring it back or he may forget that he wanted to use gas. It is also economical to purchase supplies in large quantities ahead of the demand. It is cheaper to buy in larger quantities than in small quantities. It is necessary to keep more money on hand than you absolutely need, from time to time. It is good business practice, because there are frequently unforeseen expenses that you ought to be able to meet. Also your credit at the bank is not very good if you don't manage to keep a reasonable de-

posit on hand. They would rather not carry your account if you can't keep a deposit on hand that is commensurate with the size of the business and the work entailed in carrying the account. It is necessary to keep a balance in the bank to meet demands. There are demands coming semi-annually for fixed charges and for things that it is impossible to take out of one single month's revenue and the proper and usual custom of the corporations of all kinds, is to accumulate from month to month so that when the time for actual payment comes, the amount has been gradually accumulated from the preceding six months or a year. The same thing would apply to items not strictly fixed charges, such as the purchase of a holder or something of that kind where you make a contract requiring you to pay out definite sums in the future. Commissioners and engineers ordinarily allow a balance, where the bills are paid in advance, the amount of one and one-half or two months' bills. When a
1027 month's credit is extended as in the case of the gas company, an allowance of about two months is fair. The allowance varies somewhat in different parts of the country before different commission- and also according to the necessity for supplies and necessity for carrying accounts receivable. The inclination is to be somewhat liberal in those things as near as I can read from the reports, and the custom is always to make an allowance. Exhibit 7-*b* purports to be an Exhibit of material and supplies on hand, accounts receivable, cash on hand and in banks and advances paid out and constitutes in that the so-called current assets of the company, as distinguished from the plant assets. On the other hand items 6 to 11 inclusive cover the current liabilities being bills and accounts payable, wages and salaries, accrued interest on bonds and bills payable, deposits of customers in the hands of the company and the difference between the two amounting to $72,037.83 constitutes the then difference between the current assets and the current liabilities and is commonly considered working capital and is in conformity with the usual custom for arriving at the working capital of a concern. If the balances are clearly stated, it indicates the difference was the actual capital employed at the time for working capital, as a necessary part of the capital of the company. Depreciation from use in giving the service is generally recognized as a proper operating expense. I was a director of the company when the East Lincoln holder was constructed and put into service and I was acquainted in a general way from conferences with the manager, with the conditions that led to the construction of that holder. There had been a great deal of complaint, well founded, as acknowledged by the company, of a lack of pressure pretty much all over town but more particularly in the northeast portion of the town at certain periods of the day. It was almost impossible in 1904 and 1905 to get a pressure on the gas stove. I was living on the east side myself and happened to know personally of the conditions by reason of investigating it on the complaint of my wife. The complaint was pretty general and the question
1028 — as to how to correct the trouble. While there was some complaint from south and southeast it was not so strong as from the east side. It was determined to relieve the trouble and some relief

was obtained by tying in the mains so as to get better circulation, but it was found that it was necessary to do one of two things; either to build much heavier mains in all directions from the gas plant or to build a separate holder in the east side, which would take care of the development of the northeast territory independently and at the same time relieve the plant from the demand on it for that section of town, and give the capacity of the plant to the southeast section, and in that way the southeast as well as the northeast section would be relieved. The general opinion was that in the long run it would be a cheaper and less expensive operation to build a holder than to try to correct the main situation. That was assuming too, that the provision would in the future again have to be made for further enlargement and extension by reason of anticipated growth. An account receivable of a public service corporation is a part of its assets or capital, until it is determined to be bad and then it is charged off to profit and loss. I was present when Mr. Adams introduced and I have since had access to the comparative tables which purported to have been derived from the annual reports of the gas and electric light company in Mass. through the Mass. commission and I have also had access to the reports of the commission, volume 28 Document 35 for the year 1912. I endeavored to trace in this volume to its source, the information contained in the tabulation of the tables, and to reconcile the figures presented by Mr. Adams with the expenditures of the Mass. companies as they are reflected in the reports of the gas commission.

L. E. WETTLING, being recalled for further direct examination, testified on rebuttal for plaintiff as follows: Pages 4106 to 4191 original record.

Direct examination by Mr. Rose:

1029 As I understood the testimony regarding Exhibit 249 to 363 inclusive with the exception of two or three pages, the information contained in those Exhibits purported to come from Gas and Electric Light Commissioners of Mass. I have reference to the Exhibits contained particularly in the group of Exhibits entitled in the one case "Other gas plants compared with Lincoln gas reports." That comprises Exhibit 249 to 363 and other Exhibits, which were originally marked 240 and afterwards brought forward and corrected to 268 to 393 inclusive. As to Exhibit 249 which was specifically excepted, there are only two items appearing in the document referred to before the Court. In Exhibit 350 one of the items appears in the report referred to, but not in the form stated. The same is true of Exhibit 351 to 359 inclusive. None of the items appearing in Exhibit 360 are found in the document referred to and the same is true of Exhibits 361, 362 and 363. In Exhibit 368 I find only one of the items referred to and that is found in the document but it is not in the same form. In 369 the rate named for the town of Attleboro is $1.00 per thousand, and I find that the document referred to states that the average price received in Attleboro was $1.11 per thousand for gas consumed, this being shown on page 128, which states that in Attleboro the year ending June 30, 1912, the rate was reduced from

$1.20 to $1.10. At some time prior to that time the basis was $1.20. Now referring to the items contained in these two groups of Exhibits with respect to salaries, office expenses and distribution expenses, there are no conclusions or groupings of expenses in the document referred to, shown on page 248-a and forward, which correspond with the grouping in the Exhibit and there is apparently no information in the document itself which would enable another to cash the same amounts as shown in the Exhibits referred to, which are headed as to those items "All expenses except materials and labor making gas, repairs, renewals and taxes per sworn return to Mass. Commissioners," with the sub-heading "Salaries and office expenses" and "Dis-
1030 tribution, and general expenses", with the total of the two subdivisions.

The document referred to shows that the total cost of manufacture, purchase and distribution of gas for the year 1912 of Haverhill Gas Company, was .68026 cents per thousand cubic feet without any depreciation; for the Lincoln plant for 1912 Mr. Adams has estimated .599 cents covering all items of expense and depreciation and says that this is an extreme allowance for the cost of manufacturing and distribution and overhead expenses combined. Deducting from this amount the amount assumed to be depreciation, in accordance with the testimony this morning, the six cents per thousand cubic feet, leaves the total maximum cost of manufacturing and distribution for the Lincoln plant for the year 1912, .539 cents per thousand cubic feet, and .14126 cents per thousand cubic feet less than the cost in Haverhill, as stated, for the period referred to in this document.

The impression was left, by Exhibits 369 to 372 that the gross profits remaining in the Lincoln gross income above actual operating expenses, was so far in excess of the dividends paid per thousand cubic feet in Mass. that I have compared these Exhibits with the report contained in the document referred to. I find that the balance from the year's operation, referred to under that caption as shown on page 255-a after deducting therefrom the item called other expenses in the column at the top of the page, the profits were as follows: In Boston .27046 cents per thousand cubic feet; Broc-ton .303 cents per M cu- ft. Cambridge .30185 cents per thousand cubic feet; Charleston .28901 cents per thousand cubic feet; East Boston .17106 cents per thousand cubic feet; Fall River .24869 cents per thousand cubic feet; Fitchburg, .21766 cents per thousand cubic feet; Haverhill .2381 cents per thousand cubic feet; Lawrence .2399 cents per thousand cubic feet; Lowell .28948 cents per thousand cubic feet; Lynn .22419 cents per thousand cubic feet; Malden .22589 cents per thousand cubic feet; New Bedford .32597 cents per thousand cubic feet; Newton .19026 cents per thousand cubic feet; Pittsfield .30429 cents per thousand cubic feet; Springfield .3378 cents per thousand cubic feet;
1031 suburban .19009 cents per thousand cubic feet; Salem .33718 cents per thousand cubic feet; Taunton .30278 cents per thousand cubic feet; Worcester .23987 cents per thousand cubic feet.

I find that the cost of the manufacture, purchase and distribution

of gas, less residual and excluding depreciation reserves and other reserves, and also excluding other expenses ranges in the twenty Mass. plants, tabulated on page 254-a of the same document, from .48895 in Boston through a varying amount up to .93027 in Fitchburg. This excludes depreciation and other reserves and other expenses, which ranges from nothing up to five cents in some of the plants, per thousand feet sold. The depreciation and other reserves are combined in one column on page 255-a for these same companies and because there is not a very definite separation made, it is not quite safe to testify that they are for depreciation in gas properties, but the amounts range from $628.45 in the case of Salem, up to $74098.16 in Boston and from nothing set aside by some of the plants, suburban, New Bedford, Lynn, Lawrence, Haverhill and Pittsburg, to .11513 cents per thousand feet in Taunton. Some of these plants are strictly gas manufacturing plants and of course the reserve on depreciation stated in that case would be strictly against the gas business, but how much of it was strictly depreciation and how much other reserve, the document does not disclose; and therefore it is not useful for determining the exact amount of depreciation that the company chose to set aside in those cases. I find in the case of Malden, which was reported to have sold its gas for the year ending June 30, 1912 at the rate of 79.1 cents per thousand cubic feet, on the average, and I find that it sold 130,596 M feet to other companies and that the average price for that gas sold was 41.3 cents per thousand cubic feet and I further find that the average price to its consumers other than to the companies, was 90 cents per thousand cubic feet, which is 11 cents per thousand cubic feet more than the average price.

1032 In the case of Springfield, the average price was 80.5 and I found 166,000,000 cubic feet were sold on the basis of 40c per thousand, to other companies and the resulting average to the consumer was 81.5c. The average price received for the gas in Lawrence for the period was 80.8 per thousand. In the case of the town of Lynn shown in Exhibit 377 as having a 75c rate for the total amount of output for the years 1910, 1911 and 1912, I find the sales of a part of its gas in Marblehead to be at the price of $1.10 at a discount of 10c as shown in explanatory remarks in connection therewith. These figures are results of analysis by the commission of the return made to it by the companies. In estimating the cost of construction due to interest on money and taxes during the period of construction it is the usual and ordinary custom of engineers and public service commissioners to make an allowance therefor and add it to the valuation, interest during construction being as a rule calculated one-half the time of the estimated construction period at the rate of 6% per annum, so that if a plant required two years to build, the allowance ordinarily would be 6%, for interest in a plant requiring one year it would be 3%. The amount to be added for taxes varies according to the circumstances in different places. It is so wide that it would take considerable reference to determine just the rate. It runs all the way from nothing to two per cent. In Great Britain when they took over

the telephones they allowed 4.525% for interest during construction, which is the highest I ever met. In that same case they made an allowance for going value. It was not under that exact name. It was the cost of developing the business and it was explained in the opinion of the commissioners and the court, that the allowance corresponded with going concern value. They allowed 1.9% for subscribers agreement, 3.133% for raising capital, 1.95% to pay for the maintenance of the plant until the earning revenue was sufficient. That was a purchase case. The British government took over a lot of independent telephone plants and the reproduction new value was 15,512,484 pounds. After deducting the depreciation, the net amount paid for the telephone companies
1033 was 12,515,264 pounds, something in excess of $60,000,000.00. There was practically $16,000,000.00 paid for overhead allowance, going concern value, engineering during construction, interest during construction and all of those various expenses. The percentage was 24.37% of the physical value, including real estate.

I have one item to add for local engineering and supervision, for local administration and the head office engineering and administration, which were separate. The allowance for those three was 12.11%.

Cross-examination by Mr. Adams:

I do not now say that Mr. Adams testified that Exhibits 350 to 360 were drawn from printed report of Mass. Board of Gas and electric light commission for the year ending June 30, 1912. I was mistaken when I said that, as I had forgotten about the change of the numbers of the Exhibits, and assumed that they were applying to those introduced the first day or two I was here. The figures in Exhibit 368 are not in the same form in the report of the gas commissioners of Mass. for 1912. I think they are there in some form. Of course the figures for the years other than 1912 are not in that report. In a telephone case before the New Jersey public utilities commission, they allowed for going value. I am unable to give you the name of any commission or Court outside of the commission in Wisconsin, who have allowed for loss of material during construction. As that is usually denominated as contingencies and they do not allow it separately from the contingencies. I can tell you a number who have allowed contingencies made up partly of this item and other items. The expenses of the gas companies as taken from the report of the Mass. Gas and Electric Light Commissioners for the year ending June 30, 1912, I understand are an analysis and statement of expenses as the companies themselves have reported them. The report for the year 1912 on pages 248-*a* to 254-*a* inclusive, shows the heading operating expenses and the heading on page 255-*a* is net earnings and
their applications and on that page depreciation and other
1034 reserves are set down in one column and other expenses in another, and I am unable to find these same items in any

pages which bear the general heading "Operating Expenses", and neither do I think that these items are a duplication of the sums that appear on some prior page, under the heading "Repairs and Renewals". This tabulation does not disclose what these items other expenses were, and I have made no search to find out whether they might cover expenses pertaining to business other than gas operation. I do not know definitely, but I assume that they refer to gas operation. With reference to the price of gas in 1912 in the Massachusetts companies, I have endeavored to give the average net rate produced from gas sold to the consumers only. That conforms pretty closely to the highest net rate, but it is not the same except in a few instances. The amount of gas the Lynn company sold in the little village of Marblehead would affect the average of course, but not very much. The California railroad commission in the case of the San Diego Riverside and Los Angeles Railroad Company allowed 6% for interest on construction and in the case of the Southern California Utility Company, they allowed 3% and in the valuation of the Stockton Terminal and the Eastern Railway Company, they allowed 3% on the rate of 6% or one-half of the cost for one year. In the Iron Mountain Railway Company case, they allowed 3% for interest and in the Lake Tahoe Railway Company case, decision 640, they allowed 5% for interest and omissions. The commission in Washington allowed 2 or 3% in the Northern Pacific Railway Company case and of course there is the Wisconsin commission.

Cross-examination by W. M. Morning:

Ordinarily, the contractor figures for the contingencies and omissions and his price would include those items. On the question of the casualty liability, the principal must see that he is protected, and I would add to the contractor's price any risk in addition to the hazard of the contract. I can not give any specific instance where a property was constructed of any magnitude where the expenses of engineering and supervision was actually incurred by the company construction the plant, as I have made no
1035 investigation to lead me to anything like that. I have no personal knowledge of any construction of that kind. I think if the Lincoln Gas Company were to reconstruct this plant and there was a cost of $500,000.00 to construct the physical property, that it would incur an expense of $25,000.00 for engineering and supervision. The allowance of a percentage for omissions and contingencies depends upon the conditions met and the size of the items that go into making up the whole. It would not be so much contingencies in the assembling of a few large items as in the assembling of a great number of small items. For instance, in the case of a building to count the number of brick or estimate them by cubic measure. The contingencies are there just the same as though you know you have lost a certain number of bricks in the building of this building. The allowance must be made for the addition to the price or for added contingencies in

a lump sum. In laying pipe there are broken lengths and various other difficulties met which you can't see by looking at the map, which merely outlines where your pipes lay, so I feel that the item of contingencies, by the reason of omissions, cost, breakage and unfor-seen defects, would lie in the investor practically the same as in projected plant. There is not much difference. I think that would be true in the case of this gas plant. That would be in addition to the fact that the inventory might not be taken carefully. Our company employed Mr. Brodnax with a corps of assistants to make a complete and thorough inventory of this property and I understand that he has tried to do so, and that his inventory is just about as complete as it could be. I do not think he would make as many omissions as anybody else, but they are there just the same. He is an expert in that particular line and was employed because he was. He had some two or three assistants here and worked a considerable time. In the Lincoln Telephone Company case before the commission, our engineers found that the omissions in the inventory submitted by the company, amounted to 9%. After the connections were made the omissions would be reduced to a minimum, but there would still be the contingencies item.
1036 It is almost impossible to get an exact inventory, and we would still add the percentage for omissions, if the connections were made.

The purchase of large supplies of stock and material cuts down greatly the size of the bank account necessary to operate the business. I think that the expenses of organizing a corporation, is a part of the capital investment. If an individual was going into the business, he probably would not have that expense and if the individual had all the money needed to operate the business, he could get rid of the expense of getting the necessary money that a corporation would have, and under such an ideal condition a lower rate would be perfectly compensatory to him, while it would not be to the corporation. There were 253 new consumers added to the business of the company in 1912 which was in part the result of the operation of the new business department. The new business expenses for 1912 amounted to over $19,000.00. I think that is a fair representation of the net increase during the recent years and I believe the money was well spent. If they had not spent that much they might have gotten five or six or maybe ten or twenty consumers, or they might have lost more than that and there would have been no net gain at all. The people would fail to use some of the appliances they are now using, if they didn't have stimulation. The current expenditures per month in round figures for that year were about $18,000.00. The receipts are collected twelve times per year. The average will be outstanding about one and one-half months after the bills are delivered. The average is about forty to forty-five days, because there are a number who don't pay and of course others who are a month or more behind in their payments. Those who are late pay a little more. I think the working capital set out by Mr. Lea of $72,037.63 is a reasonable amount of working capital. It may not be absolutely neces-

sary to keep on hands in the bank $56,920.00 but it might be embarrasing not to have it. I do not think $2105.84 is a large amount of money to have on hands in the till outside of the banks. I do not know the purpose of keeping money on
1037 hand in the Doherty Bank in New York, but I think it is necessary to pay coupons and interest. It is part of the working capital. You have to accumulate the interest on bonds from month to month. If the charge is $30,000.00 every six months, I can not take it all out of one month's returns, I must lay aside out of the receipts $5000.00 each month and send it down to New York. I may send it down in advance or I may hold it out here and send it down altogether, it don't make any difference. There would have to be a substantial sum to lay aside on an average throughout the year, of working capital. If the company had no bonded debt and the money was being accumulated in the bank, its distribution in the way of dividends, while the money is there before division of dividends was made, would enter into and be a part of working capital. Of course if the dividend was not declared and the accumulation of the money kept there for five years or longer, we would not expect the public to pay a return on that. If it pays a dividend each three months instead of waiting until the end of the year, the amount would probably be less. The purpose of the construction of the East Lincoln holder was to remedy the condition of pressure all over the city, particularly on the east side and ultimately by the relief it gave to the east side, it would give a change for more pressure to be given to the southeast. It was generally anticipated that some time in the distant future we would reach University Place and Havelock, but I do not think it was definitely settled at that time. Prior to the construction of this holder, it is my impression that they were selling gas at University Place and shortly afterwards I think they started to sell gas in Havelock. My recollection is a little vague on that. I never saw Exhibit 389 before. The East Lincoln holder was necessary incidentally, to the Havelock business in order to raise pressure. The condition out there was exactly the same as in the sixth and seventh wards here. The holder is of considerable assistance in serving the districts of Havelock and University Place, but
it is my impression that it would have been built if
1038 we had not been able to get to Havelock. I don't think we had any right of franchise or any chance to get there when the holder was built. It was just a hope of the future. While Exhibit 389 contends that they were then already in Havelock, I think that as soon as they determined to build the holder, they immediately started a campaign for getting a franchise and permission for getting into Havelock and University Place. If we had not gotten the East Lincoln holder, we would probably have been forced to lay heavy mains from the works away out to University Place and Havelock and for a sub-distribution system running from the heavy mains. With this holder we were able to serve those places with smaller mains from the old works out there. The need of the East Lincoln holder was

felt regardless of the outside extensions, and the extensions out there did not come up until after it was determined that something radical had to be done to relieve the situation, and while doing that we probably concluded that we might just as well, with a little larger holder, build out there, but the holder would have been built regardless of the Havelock and University Place extensions. It might have been a little smaller and it might have been just as large. I do not know whether it would be economical to build a large one or a small one. I am not sufficiently acquainted with the operating end of the plant to say definitely. The matter of employing Sloan, Huddle & Co. did not come before the board of directors. I expect it was authorized by the New York office, I don't know, but that is where the orders usually come from, in regard to any considerable proposition or unusual thing. The ordinary running of the office is done here, with the usual supervision of the President from New York. I know that Sloan was here but I don't remember. My impressions is that it was two or three weeks. I do not know what they did to earn the $2650.00 from this company. I don't know what their report was, I never saw it. Mr. Sloan was here about the middle of 1912 or early in 1913, I am not sure. It was prior to this hearing. I know there was some talk about
1039 getting an engineer to make a valuation and I got the impression right from the start that Mr. Lea was the man who was going to do it. I knew that Mr. Sloan was here, but what particular thing he was doing I don't know.

Cross-examination continued by Mr. Foster:

In the valuation of the telephone company by the state railway commission, aside from the omissions there was an error of something like $100,000.00 on the conduits. They were calculated in conduit feet instead of trench feet. There were other errors that compensated for this, but I guess it reduced the valuation about $120,000.00. It was never brought up in that hearing, but it was corrected by the telephone company after it was discovered on the third checking over their business by other parties. It was discovered by Mr. Anderson of Chicago. The matter of omissions, contingencies and errors works both ways. If you get the wrong quantities *and* you may make a mistake on the unit price. I understand there were some errors of considerable size in the inventory of the Lincoln Gas Company and I don't think some of them were discovered until checked over the second time. However, in making an inventory you seldom include everything that you have, even with the most thorough checking. In reference to the $30.00 per customer allowed by me in the going concern value, this should be allowed even where the cost of obtaining those customers was charged to operating expenses, if while these operating expenses were being incurred the stockholders didn't get sufficient dividends to cover their investment. If they relinquished the dividends and turned them into the new business expenses or the developing of business, it is just the same as if they had received the dividends

and handed them back. If an amount equivalent to dividends had been paid out on interest or coupons on bonds to cover the value of the plant, the expenditures of this kind, after the preliminary building up of the plant, should not be both in the operating expenses and the going concern value. If your operating expenses are $90,000.00 and in that is included $7500.00 for new
1040 business and investors had an investment in the property which entitled them to earn $7500.00, there is no difference between leaving the $7500.00 in for the purpose of getting new business, and drawing it out in the form of dividends and then paying it back for new stock. I do not see why the cost of producing new business should not be charged to operating expenses and the cost of making gas. It is a necessary, ordinary, usual and common expense, practically, in all companies. Out of the working capital I think there is $44,000.00 held on deposit which was secured through the sale of notes, the proceeds to be invested under the supervision of the State Railway Commission, but if this $44,000.00 was not in the working capital, we would have to borrow it from some other source.

Cross-examination continued by Mr. Morning:

If the Court should find that the reason the company here had not paid any dividends, which was due to the fact that it was paying excessive bond interest, then the current expense of obtaining new business would not be included in the current operating expenses and also included in the investment of the company under the name "Going Value". It would not be justified in both cases.

Redirect examination by Mr. Strode:

Frequently in construction work, the item of omissions and contingencies would be involved, if the contractor was doing the work and that item is taken into account frequently by the item of extras; when you can't cover everything by the contract, and provision is made for extras in the price fixed. The contractor attempts to include omissions and contingencies when he makes the contract and adds enough to the price for what he thinks is the fair cost. It would not be possible for a person to come here to this present plant and design and build it and avoid having anything left out or anything short, and in addition to what the contract is for, as to a particular piece of work, the company still has to bear the items of contingencies and omissions, in that work, in connection with other work lying between the two. These percentages vary of course in different places,
1041 according to the information of the various commissions and Courts. They are generally applied with a full knowledge that part of the work is done under contract and if you want to apply contingencies specifically to those items where such contingencies were likely to occur, then that percentage for contingencies if applied only to the items where they might occure, would be much greater, so for the matter of convenience in calculating the matter of allowing a fair average, they say the contingencies will be applied to the whole

regardless of these specific items, and they apply it to the land simply to bring in the whole, as far as that basis is concerned. Occasionally you will find where the Court or commission specifically says the percentage for contingencies will be allowed on everything except the land, but as a rule it is allowed on all values and the proper allowance made in the rate of percentage so that they feel it is covered. The Mass. report prepared by the commission, says that it is compiled from the reports as stated by the companies in their returns. I understood and assumed that the items occurring on page 255-*a* of the commissioners' report for Mass. for 1912, being other expenses and depreciation and other reserves, were part of operating expenses of the gas because they are in the tabulation of the gas operations and the operations of the gas manufacturing company, and were directly connected with gas operating expenses because they are deducted prior to the deduction for interest and dividends. The item of depreciation is entered properly as an item of operating expenses and I am acquainted with the holding of the commission and Courts in respect to that item and the amounts usually allowed by them, and it is generally allowed in public service plants for the purpose of anticipating and distributing, along a large number of years, that unavoidable decay, coming from wear and tear, from weather stress, obsolescences, inadequacy, which is not realized directly from year to year and is distinguished particularly from repairs and maintenance, so that

when any plant or any of the component parts of the plant,
1042 are worn out and useless there should be on hand in some
form sufficient funds to replace the worn out, lost or no longer possible to be used part of the machinery, without calling upon the stockholders or investors to invest new money. The percentage of the depreciation varies greatly with different classes of utilities and the variation is caused principally by reason of the varying ages and different classes of utilities and the component parts thereof. In a plant where the average life of its component parts is ten years, the depreciation will be much greater than in a plant where the average life of the component parts was 25, 40 or 75 years. That is the principal factor which accounts for the variation in the percentage of the depreciation allowed. When so allowed they are permitted to be added to and charged against operating expenses currently. After you determine the life of a particular equipment, by that fact you can determine the amount of depreciation, the annual portions that are to be set apart to take care of that equipment. This of course assumes that there is enough money expended from the so-called current accounts to keep the plant repaired and in its ordinary working condition. In determining the life of any particular equipment, it is assumed that it shall be kept in as good repair as possible. Of course there are certain things that are impossible to take care of, as they wear out, for instance; the pipe lying in the ground. If its life is 50 years, at the end of 25 years you can say that it is half gone, but you can't replace that one-half by any sort of repairs, and the repairs and appliances and the maintenance must be taken from the operating expenses. I have examined Mr. Lea's calculation of the going value, shown in his report and offered in evidence, and I know that it is the

method that has been approved by a great many engineers. I have heard it brought forward a great many times and it is a much more specific method than the one most ordinarily used of lumping the matter together by taking the foregone dividends for the whole period and calculating them and sometimes even computing interest
1043 up to the time or of taking the cost of acquiring patrons and consumers with a certain unit of cost and applying that to the number of consumers for the number of years. There are a great many methods used, but I think the most approved method, while in a way it is theoretical, it accords thoroughly with the practice, and that is the plan which Mr. Lea has applied. It is as scientific and accurate as any that can be projected. It is not possible to get it absolutely accurate, no more than it is possible to determine the life of any particular equipment. My method of estimating $30.00 per consumer for going value was just one of my plans for checking rather than for the purpose of really arriving at a definite reason for it, and I cited it as an instance of the manner in which some people arrive at going concern value. It is a kind of short cut, but inaccurate. It is rather the result of making a division and finding out how it came about, rather than to follow out the real theory of the problem. I know that from knowing what the new business department was costing for the next ten years. It is made on about the same plane and fully as accurate as the computation of repairs and renewals on the basis of 9c. per thousand feet of gas.

Cross-examination by Mr. Adams:

I have compared the report of the gas commission of Mass. for 1912, with the original returns of the several companies from which it was compiled, and I do not know under what heading in this return the items marked other expenses on page 255 occur. I assume them as operating expenses because the commission has put these tabulations out under the authority of the state that they are accurate and reliable.

Cross-examination continued by Mr. Morning:

Ordinarily in the past twelve or fourteen years, no sums have been set aside and entered in the operating expenses for depreciation. There may have been one or two years in which it was set
1044 aside. No item of depreciation has even been entered in the operating expenses. Such items that have been entered may have been through extensions or renewals, but they have never been segregated; and in order to make a comparison between the general expenses of this company and the general expenses of the Mass. companies, the item of depreciation, if they have such an item, must be extracted, and I have done so in the comparison I have made. The principal criticism that I had of Mr. Adams' tabulation, was the omission of item of so-called other expenses from his statement of all expenses except manufacturing expenses, renewals, maintenance and taxes, and then attempting to compare them with the items in the Lincoln reports. Mr. Adams had no figures that included the entire

expenses. In the one instance of Haverhill plant I took all of the expenses as shown in that report and added the so-called other expenses and then from his estimate of the Lincoln operating expenses complete, extracted from each the allowance and depreciation and compared the net result with the net result at Haverhill. We don't know yet whether Mr. Adams compared the same general items from the Mass. companies with the same items of expense out here. We don't know whether the items included in Exhibits 350 to 360 and from 367 on, designated as all expenses, except the cost of manufacturing, renewals, repairs and taxes, we don't know whether that was a just and proper comparison and contained the same identical items as were contained in the so-called estimated 12c. per thousand cubic feet for general expenses and distribution in the Lincoln plant. The figures that he used can't be found in the report. Mr. Adams claimed they were found in the reports made to the commission. The same groups are not in this report. They are not grouped in that same form and you can't identify the items.

1045 Cross-examination by Mr. Adams:

When I studied the reported summary of expenses of Haverhill plant from the report of commission for 1912, I intended to take all operating expenses plus all other expenses item.

Redirect examination by Mr. Strode:

The heading of Exhibit 350 is "All expenses excepting materials and labor making gas, repairs, renewals and taxes, per sworn returns to the Mass. commissioners." I assumed under that heading that Mr. Adams had undertaken to assemble all the items of expense in the manufacture and sale of gas, except those specific items which he specifically excluded. It is impossible to identify the items contained in this Exhibit with the items from the published report, but I do know that Mr. Adams has excluded entirely the item of other expenses from his Exhibit.

Recross-examination by Mr. Adams:

Page 8 of part of the original return used by companies to the Mass. commission for the year ending June 30, 1913, has for its heading: "Gas scheduled statement of income and expenses." On the page is a place for the item "Other Expenses" and on line 29 is the item "Total expenses."

1046 E. C. HURD, being first duly sworn, testified on rebuttal on behalf of the plaintiff as follows, pages 4230 to 4105, original record:

Direct examination by Mr. Rose:

I am 45 years old and my business is economic engineering. I graduated from the engineering school at Illinois in 1889, and have followed construction and general lines of engineering with slight

interruptions ever since. For the past three years I have been in charge of the valuation of public utility properties for the Nebraska State Railway Commission, but at the present time I am engaged in private practice along the similar lines. Our firm is the firm of Hurd, Gerber, & Wettling, with offices in the First National Bank building, Lincoln. We do both engineering and accounting. I have erected several hundred miles of steam railroad, about 50 miles of electric railway, and have engineered for separate electric light and fuel plants and two hydro-electric plants, and have taken part in the business management of an electric property, and have done some little work on gas plants, but I don't make any pretense of being a gas engineer, and I have acted in various capacities in the handling of such properties for bankers and brokers. While I was with the Nebraska State Railway Commission we valued the entire railway properties in Nebraska except street railways. Practically all of the telephone property and express properties and the Interurban railway properties. In valuing steam railway properties you are valuing almost every conceivable class of property that you can think of, everything connected with the steam railways, even electric light plants, gas plants, and all kinds of things. I have also in the course of that employment had to do with the valuation of a street railway property in Lincoln and suburban properties, and I am acquainted generally with the fundamental elements that enter into the cost of construction of public utility plants. My information and data comes from every source that we can get, not only from my own experience but from the sources outside.

In a plant like the gas plant in the city of Lincoln there
1047 are costs specified in the construction on account of contingencies and omissions that are not reflected by an inventory of the property. It is a very usual practice for engineers or valuators who are acquainted thoroughly with that class of work to make an addition to the original organized fundamental items, usually in the sum of a per cent, and to prove that fact by the experience of those who make inventories and afterwards checking so as to establish the reason for making the addition which you term contingencies. The factor of omissions and unfor-seen circumstances that can't be taken from any visual expression or history of a property in its construction in its vicissitudes. No one man can grasp it by simply going over and taking a list of the property. There are circumstances too numerous to mention that grow up out of actual experience and an engineer in making an estimate for the cost of a new construction always adds a very liberal per cent for that item. In the actual construction that percentage ordinarily expresses the cost represented by that addition. It results in the final inventory in a valuation in adding, after you have made the first summary of the several items, an amount commensurate to cover that. There are instances that those facts have been developed almost to an exactness what the checking of the inventory might mean. Even with the infallibility of one person's work from that of another still there might be some of the remaining things which the second man didn't see. I might cite some of the cases that have come under

our experience in the telephone appraisements, and also in the railway appraisements, where it was supposed to be a complete inventory of the property but in re-checking there were some things found left out. I know in the case of the Missouri Pacific R. R. Co. that purported to be, and to all intents and purposes was, a correct inventory but on one branch they left out three important steel bridges
from the inventory. We discovered it and it amounted to
1048 quite an item. I don't remember the per cent but it ran several per cent for that item, and we probably added two or three per cent to another amount. In the case of the Lincoln Telephone & Telegraph property we made a checking of approximately 45% of their entire property in the field and central station and the omissions alone were approximately 5% of their entire valuation, and possibly we over-looked something further, but we allowed the 5% on that basis. I took it from that proceeding that they were anxious to have a large valuation and the dropping of large items from the inventory in that case did not work to the pecuniary advantage of the company in the situation it was in before the commission. It was simply an omission which incidentally goes with most all work of that character. In the York case we made a personal inventory of the plant, I, myself doing the work, and I found quite a number of items out in the field which amounted to something like 4% of that entire item, which in telephone properties is 75% to 80% of the entire value, and my assistant in the Johnson county case found almost similar circumstances in checking the inventory which the company's employees had turned in as being correct. There were some items found that weren't in that inventory. The item of omissions and contingencies costs money. It represents construction. If everyone is so absolutely accurate that they don't do what the usual fellow does then there wouldn't be any such item, but if you take the ordinary run of affairs of business you find they do make omissions, and have other contingencies. In addition to that there are such items as loss of materials, bolts, and broken material in the actual assembling of buildings and this is illustrated by a test which we made on some railroad track. The Union Pacific R. R. was double tracking. The engineers made the estimate and the material was very carefully gone over as to the weight of rails, and the distance, and the track fastenings. The condition was ideal
and we got exactly what went into that track today, but the
1049 amount which was used is approximately 3% greater than what you can find there today. I do not think it is a practical possibility with the present efficiency of labor to avoid these losses. Materials are very apt to be stolen, lost, or disappear in one way or another. There is always some lost on that account, and the more small parts you have the greater relative per cent you have. In a property like the Lincoln Gas plant the physical property is valued at approximately one million dollars by one side and $560,000 by the other side, and if you have every item accurate and have the exact amount of money which they had expended I would say that you will find a difference at least of 4%. In other words you would add 4% to your fundamental items to cover this item of con-

tingencies and omissions. It may be less than that and it might be more than that but that would be a reasonable amount. That would be an expenditure and an investment that could not be avoided. To my knowledge that is an item that is generally allowed as a part of the cost of construction by engineers, public service commissions, and courts. The expenditure for the item of engineering and supervision is another item that would not be reflected in the inventory of the physical property after the plant was constructed. It would be just as much an item of expenditure of the capital account as any physical, visible thing. The size of the plant and the various conditions surrounding it have a good deal to do with that matter of expenditure. If it is a question of reproducing this plant there is no question, taking all things into consideration, but that it is presumed that the promoters would at least seek expert engineering advice as to design, and have a study made of the field as to the economic location of the producing plant, trackage facilities, location of mains, and all of those things, together with the actual construction designs, and later supervision of the structural portion of the plant as it was placed, and I would say that a reasonable amount on this plant would run from five to ten per cent on the con-
1050 struction cost, depending on how earnest the promoters were and how well-placed the plant that they might have designed. The purpose of spending money for this purpose is to increase the economy of construction and operation of the plant after it is finished and it would be money very well spent. The contractor ordinarily would not have any part or parcel in such a matter. He would be supervised by the engineer who was employed rather than the engineer being employed by the contractor. In order to get the benefit of the engineering skill the promoters require the contractors to be subservient at all times to the engineer. Also in the construction of such a work there is always casualty liability. I have never known of an extensive construction that didn't experience such an item. Recently it has been taken care of by directly obtaining insurance on the labor employed. It becomes a direct charge for construction and is reflected either in the increased price which the contractor charges or is paid direct by the owners. I haven't made any accurate calculation on the plant here on this item but from my general knowledge of the rates I would judge that on the distribution system that item would cost about 1.8% of the total cost. The rates are based upon the relative amount of labor and on the distribution system, 60% is labor and 40% is material. On the buildings and machinery the rates would probably equalize that, giving a relative amount of labor and material that would differ from the distribution plant somewhat. Together, the two items would amount to about 2% of the inventoried items. It is unavoidable that in addition to the sums paid the contractor for erecting the works, in the execution of such an enterprise funds must be employed for different times upon which no revenues can be derived. Also, in the building of a utility of this size the length of time for construction would be sufficient so that the property in a dead state would become taxable, but of course the extent and

amount has a good deal to do with the amount of taxes paid.
1051 The taxes on the real estate would not be relieved at all no matter who owned it. I made quite an exhaustive study on that taxation question before the operating period on a number of utility properties and received some very accurate statements relative thereto. And by considering the property and the investment of about one million dollars the tax item on this property would run about ¾% of the total value of the property when completed. Some of the conclusions reached were as low as ½%, some approximated 1%, owing to the length of time the construction is in progress. Now as to the interest on the money, during the construction work under my charge we have carried out a policy of allowing for that, unless the term of construction is fixed, at one-half of the total investment for the total time at a reasonable rate of interest, and in all commission work they allow a rate of 6%, and if you would reduce that to its cost, whatever the length of the construction period was, at 6% it would give you the result. That would be only on the total of the fundamental items. As to the time necessary to build a utility like the Lincoln Gas Company's involving the expenditure of approximately one million dollars that is a little difficult to answer. I haven't made a study of the situation in that regard but there are some principles which are a pretty good guide. The condition for establishing a business and the conditions for obtaining machinery and the assembling of the property should be on an economical and sensible basis. You might hurry the construction or you might delay it. Probably if you hurried it you would eliminate some of the expense and abnormally create others, so that possibly a hurried construction would cost a little more than what you would have to pay on a moderate rate of construction. I should take some time to build a business or plant of those dimensions. I would take the course of a provident investor and would see that the property advanced in the same relative rate as the
1052 building up of business, and I would say for this plant I would take two and a half years—something of that kind.

E. C. HURD, recalled for further direct examination on rebuttal, testified on behalf of the plaintiff as follows, pages 4267 to 4303, original record:

The item of interest during construction is a part of the investment. The commissions so allow it as being such. Whether actually realized or experienced it is, in part at least and as a matter of equity and fairness it has been considered in the proportion which I have mentioned. If the investor had his own money it would be worth the rate of interest in effect if he had not invested it idly in the plant. It is generally considered part of the over-head expenditures in appraisals, however. I think first statements of values are being refined. Personally, I question whether it is an overhead charge but it is truly a part of the cost of construction, and the preceding remark might apply also to the item of contingencies which is many times included as an over-head charge. Contingencies really should apply to the related elements. Omissions or contingencies occur in some particular fundamental item. The proper

way would be to al-ocate it to that item but this does not in any way deny an actual investment but simply mildly criticises the calling it over-head charges for the reason it causes some misunderstanding as to the classification. As to whether omitted or over-looked items fall upon the contractor or upon the investor depends altogether on how the statement is based. If you are making up a category of elements to comprise a reproduction cost of a property you might put it on two bases. One would be to say that the whole matter was contracted for at so much per unit or whatever was being constructed for a lump sum. But very generally these contracts have a condition or provision in them that in case of additional work, etc., it is to be carried on and put into the contract plus a certain per cent that vertually is a contingency accepted by the con-
1053 tract. So in actual construction the burden may ultimately fall on the investor absolutely and it doesn't make any difference if your basis of procedure is to make the statement up and it is void and the contract plain, you are doing it yourself and you simply fall heir to some contingencies. It makes no difference. They are specified just the same and my practical experience is you don't get away from it many times. I find them larger than anticipated.

If the plant is once constructed working capital necessary to conduct the business is incident to the first financing and can't be separated. You can't conduct any line of business without some ready money to proceed with and pay for certain things that are really not inherent to the construction. They are beyond, and to illustrate: if you are operating a gas plant you have to supply yourself with a certain amount of labor and a certain amount of fuel and tools, and those various elements are common in the conduct of the business and become inherently a part of it and you have to have enough money to carry that. Then if you are prudent and expect to make a success of your business you must be in a position to purchase these supplies at the best time and at the most economical time and in quantities and it makes no difference whether you have the money on hand or whether you are able to borrow it. It is all the same fact so far as carrying that amount of capital is concerned, and when invested for this purpose it is a capital expenditure. There are several plans used of determining the amount of working capital necessary. One of these is to take the actual experience of the property and you find it generally to be the most reliable. Every plant fluctuates more or less in its suroundings and considering that the accounts are kept carefully that probably is the best thermometer that can be devised. Another is to take an accounting of all of the current assets and liabilities of the property as found and the difference usually is represented as the working element, and if you take the difference between those it is a demonstration of what is actually carried by the company as working capital. Another
1054 plan is to determine from the character of the business and the amount of time for which material must be carried from season to season or from purchasable time to purchasable time and from that how much money will be idle and the expenses be met.

That is more or less a modification of one of the schemes I mention but is used frequently. It is certain that a complete statement of the cost of the property or value would be imperfect without an allowance sufficient to carry the working business of the property as represented in a working capital.

Going value is an item of capital investment known to engineers, utility commissions, and courts. Included in going value as one of the elements is what is usually termed by commissions and courts as development costs. These differ in one class of plants considerably from other classes. Development costs expended after you have your physical machinery in perfect readiness for operation to solicit and get business to care for it as a money-making going thing are certainly a capitalistic expenditure. Going value is a thing difficult to prove but there is a bona fide investment in that item. By going value is meant all of the elements arbitrarily classified as intangibles. There is no question but what this is true. There are accepted plans for determining values or formulating value statements of property. Some of them seek to show only a certain cost for a building of the plant, and others attempt to show value. I think there is quite a difference between cost and value. A physical machine may cost a good deal of money or a little money and yet its position or possible utility or what it can be used for has a good deal to do with the value of the whole idea and I don't think they are absolutely co-related except in one respect and that is as to cost. If you are organizing a cost statement purely only one of the elements on which you would figure going value would be dependent and have an indeterminable part in finding out what your intangibles were. Now there might be an investment in going value or there might not be. If it is value that we are after, or, in other words, what a man would pay to find a successful machine in operation and I am sure he would pay something to find a sure going institution to operate and it would be worth something to him
1055 because it has proven successful and moving along and he doesn't have to resort himself to the means of expending and doing some work and building something new to find whether or not it will be a success, and the measure of the two, or that value, is demonstrated by what he might pay over what had been developed. If you were running a store and advertising the business you are paying the money for development costs which is the same. You may begin advertising a week before you open the store and it is very similar to what you have here where you hire solicitors to go out and get subscribers for whatever you may have to sell so that becomes actually a matter of cost. Now in calculating going value this should be added to the cost of the physical machine as being one factor undertaken to develop it. If this development cost was not paid as a separate item or included in going value or in some form in the valuation it would be eliminated from part of the inevitable capital expenditures.

In a case like the gas business where the contracts are obtained for the company and the connection is actually made and experience shows that the customers obtained are consistent customers the vari-

ous commissions have allowed in their valuation for the expense of obtaining such contracts as development costs. One method of reaching a conclusion on a matter like this is taking the probably number of consumers at a certain period and succeeding periods and estimating the cost of procuring those customers. The depreciation of the company's property from wear and tear while gas service is being rendered is a part of the operating cost of that service. There is no other account that it could be charged with. Depreciation means final renewals and repairs and it must come and it is the universal practice that it should come out of the operating revenue. The reversal of such a scheme would be a continual and increasing capital account such as the railroads have in Great Britain. This is considered impracticable and incorrect in that particular because every time a renewal is made the capital account is increased so
1056 that the capital expenditures for a period of years would be enormous. To my knowledge such a practice is not countenanced by courts or commissions in this country. It is absurd to consider depreciation as anything else than a part of the cost of the service. I have examined and understand the method presented by the tabulation of Mr. Lea to ascertain the going value of the Lincoln plant. Assuming that the figures of costs in section K of Exhibit 7 are correct and from my knowledge of this property here and its being in a successful situation, my opinion is that he has used an approved method and one that is used and accepted in estimating going value. That is what the going worth in a plant is over and above its physical factors of cost and shows what a man might pay for a property in addition to its physically shown investment because of it being a going concern. I think it includes the actual capital expenses that have to be allowed for the development of the business such as I have classified separately.

Cross-examination by Mr. Foster:

Mr. Lea's method is a method built up first of a determination of the investment, and second a determination of the progress of the business based on the experience of the property under consideration, casting ahead for a period of a certain number of years that may be ordained to continue the progress of the actual plant, and also to build corresponding therewith a hypothetical plant until a hypothetical plant practically parallels the existing plant at that time, and then reducing the matter of years to a present time basis and extracting therefrom the going value as represented in the future returns. As I remember it the earnings shown by Mr. Lea are based on the experience of the property at the existing rate. If the rate were reduced to $1 it would be introducing a new factor into the equation of going value. The rate of return is a vital element in the computation. If you computed the going value on two different rates you will arrive at two different results. This is exemplified by a losing concern. If at present it was losing
1057 money a very different result would be obtained as to the going value than you would obtain if it was a profitable con-

cern. If the consumers of the Lincoln Gas & Electric Co. were divided into three different districts for the purpose of collection of bills and if each one of those districts had a different period from the other for the payment of bills making three different collection periods during the month the expenses of clerical force, etc., in the office by reason of the frequent collection would exceed somewhat the expense in a less frequent collection and no matter how frequently the collections were made if each individual was given the same length of time to pay the bills that process would practically amount to the same as collecting the entire city at one time. The customers would be carried an equal amount of time so the amount of working capital for each individual customer would not be very greatly different. It might make a very little difference but the total length of time carried as an average would be about the same. You might have the use of the money and you might not in the operative conduct of the business if you were collecting at three different periods each month. If you are carrying an individual either collectively or singly the length of time would amount to about the same conclusion. If you are in position to buy supplies in large quantities you thereby save in the purchasing price. The two large items of supplies used by gas utility companies which they buy in large quantities are coal and oil. The coal is purchased in considerable quantities specially because of conditions of the market and many times threats of strikes in the coal mines. A utility has to be prepared to run continuously. The oil might not be affected by such conditions. It is true in a measure that both coal and oil are bought by most public utilities on contract at quantities to be delivered from time to time as needed, but still all of these contracts are subject to strikes and unavoidable conditions and a utility would have to be prepared to protect itself in that way. If a gas
1058 utility company was buying its coal and oil under contracts if done under a considerable period of time and you took a limited period I would not say that the amount of money which is represented by the quantities actually purchased and kept on hand would be a very accurate basis for figuring working capital. If you were taking a very extended period it would be a nearer basis but there are exigencies in all cases and though a company, as I have stated, might not have the money actually on hand and has to borrow it it would be the same thing. If you had accurate statistics on a five-year period it would be an influencing criterion, but would not be conclusive. I am familiar with the amounts allowed by various commissions and courts for over-head expenses and Mr. Gillette in his investigation of the cost of constructing the Washington railroad allowed somewhere from 6% to 24%. The average was somewhere about 11% or 12%. One was very high—about 24%, and did not include any interest on the money during construction or any contingencies. His items of over-head expenses do not quite correspond to the testimony that has been given here. It would correspond in certain items, but is not a true parallel to what has been mentioned here. I have assumed that a period of two and a half years would be required for the construction of this

property, but I did not go into it in detail and I haven't formulated any detailed construction plan and I cannot give you what items I would construct in the first year unless you will give me time to analyze it. If nothing else was considered than the buildings of this company they could be put up in a few months. I do not think I could tell accurately how long it would take to lay the distribution system because there are so many related things. In a plant of this character it would be financial foolhardiness to erect the buildings all at once with no regard to machinery and then lay the mains all at once without respect to the consumers' situation. To intelligently attack the problem as a whole I would say it would take about two and a half years to successfully put in the plant and complete the thing in the most economical way, and
1059 take care of the consumers as you found them. My assumption includes working in the winter months where that work could be economically carried on, and I would have the plant entirely ready by the third summer.

Cross-examination continued by Mr. Morning:

The mains would be laid by one class of workmen, the buildings constructed by another, and the holders by another. I do not thing it would be wise to undertake to build the plant all at once. My experience is that in putting up properties of the character of a utility you have got to arrange it in such a manner as to take what you are trying to do along with building it and you must arrange your labor and the delivery of material at economic seasons and that a hurried construction makes a more expensive construction and you have an idle plant a longer season than you do if you conduct it in a more conservative manner. The construction of the buildings, mains, and the holders may all be progressed at the same time and if you are progressing them in that manner the maximum period of construction would be the longest time required to construct any one of them. If I were called upon to put in a property of this kind I would expect to be delayed by certain factors, the machinery would probably need a number of months, possibly a year, to produce just what you desired, and you would find those contingent factors would delay certain other work so that it would a result that you would have a great deal of idle capital laying around unless you paid a heavy premium to get an immediate delivery of all of your material. If you did that you could put it all in in a short time. Under this quick process you would have a large amount of plant lying idly because you would not get the users connected, and the more conservative time which I mentioned for the construction of the plant would have something to do with the amount of users you were able to connect up. In my opinion the two and a half years represents the economic period. It
1060 might be more and it might be less. Whether or not you would be able to have part of the money drawing interest during the period of construction depends upon the method of financeering. It is not usual for the financeers to put up all the

money in a large bunch at once. It is usually done by payments. Sometimes they issue bonds and sell them as they need the money, but the more usual plan is for an under-writing syndicate to finance the project and they pay it in payments about as the engineer constructing the work designates that he can economically put in the construction and the payments are made along from time to time so there is not all the money lying idle or anything like it. The syndicate would simply charge interest on the money as it was drawn. I consider money spent for engineering well invested. Any plant that is adroitly engineered would have as a general principle a better efficiency after it is finished than one crudely put up. That operates to add somewhat to the capital but afterwards to reduce the operating expenses. As between two plants, one constructed under the supervision of a competent engineer and one under an incompetent engineer, I would expect to find a greater value in the one that was constructed under the supervision of the competent engineer, and the difference in value would probably be in the neighborhood of the equivalent of the percentage allowed for engineering. If after a study of the working condition I found that a plant was crudely erected and without very much design the purely engineering work would be small and of little value. However, the superintendence that is attendant with this would be just as much for a crudely constructed plant as one where there was good engineering. The superintendence factor is a larger one than the purely engineering problem and one that you cannot get away from in either case. There would be some superintendence in the construction of a plant piece-meal, and some of it probably would be supplied by the officers of the company in a general way without the employment of outside help. At St. Paul, Nebraska, in the construction of a telephone plant the investment was about
1061 $40,000 and the engineering expense in the actual construction of that plant was approximately 10% of the fundamental cost. They paid about $4,000 in the construction of that plant for engineering and superintendence, and the engineer and those who were engaged in it got the money. I got this information from the books of the corporation. There are many bids for engineering made and accepted and contracts entered into at 5% and over for public utilities put in by municipalities. There are some expenditures that are borne usually and not accounted for in municipal affairs that a private corporation would exact an accounting of, such as the matter of helpers, etc. They are not entered into the accounting as engineering and superintendence. They are entered in a separate account set up for them and do not appear in the title so that the records of a municipal construction are faulty in that respect. The general use of working capital is to provide the current supplies and pay the current bills that are necessary to operate the business and if we had the books of the company showing about what their monthly expenditures were according to the checks it would show in a limited way pretty well about how much money was actually needed to pay the current bills. The difficulty is that many times the shifting of accounts,

etc., doesn't altogether reflect just what has been paid. The expenses are usually in excess of what those accounts show. Ordinarily in a corporation like this its bills are all paid by check and if we took year in and year out the average amount of those monthly checks it would have the appearance of showing about how much money was required to operate that business and pay the current bills. One of the elements for which the money is spent is to produce and build up the business. The working capital is for the entire conduct of the business. The working capital pays the salaries, wages, and all the supplies and meets the exigencies that may arise, and produces the going business that we speak of, and has a relation to the going value, but going value is not entirely bound
1062 by the working capital. Going value is built up to a very large element by spending money, but the money that is spent for this is not altogether spent from this working capital. Working capital is one of the elements of going value, but there are other elements that enter into it. The working capital represents the blood of the corporation. In going value there is the capitalistic investment to consider on which a return should be paid in addition to the working capital. That portion of the capitalistic investment represented in going value is that money which is rotated in the affairs of the corporation and in the conduct of its business. It is being continually rotated. I do not consider that you are required to pay a return on working capital while it is working capital and then after it is spent to build up the going value that you are required to pay a return on that. I do not put in in that light. I think the working capital is only an agency to a means and is not really the vital matter. I might pay a nickel to ride two miles on a street car but that doesn't indicate what the value of my ride is. I do not think that working capital or what is necessary to conduct the business is the only feature to consider in reaching value. The idea of going value is that you are reproducing a plant up to a certain stage and going value is the cost of reproducing the business apart from the cost of reproducing the physical plant. If you were to go back into the history of a plant and see that the public has paid a return on $25,000 of working capital continuously from the inception of the scheme up to the present time and you could prove it and that working capital is kept intact from other earnings then it would have something to do with the calculation of going value. There would be a period in the early stages of the plant that the income from the business would not pay the operating expenses. How long that would continue is problematical. The loss during that period goes to make up part of the capitalistic investment in going value, and
1063 after a sufficient time had elapsed for reimbursing the owners by economic management of the plant that deficit would be amortized. That is done in some places where the actual history of the properties can be pretty well covered, especially very nearly new properties. I do not think it would be accurate to carry that loss indefiniteily to future generations as a part of the investment. It would be more accurate to make the generation that got the

benefit of that service to bear its own burden. This precludes the idea, of course, of a continually losing plant. All I know is that here seems to be a going property and because of the conditions as we found them there is evidence of some value beside the mere physical elements that we found, which was the difference between a machine installed and not in operation and a machine going and in successful operation, and that difference, roughly speaking, is represented by going value. It is necessary that the operation be successful and it should pay a compensatory return.

Redirect examination by Mr. Rose:

Mr. Gillette in his calculation of the Washington railroads returned an amount under the classification which was used for engineering and superintendence but it was not under that classification called a part of the over-head. In the reproduction of a plant with upwards of eight thousand customers the attainment of that patronage would involve the actual expenditures of funds as a reproduction proposition and it would have to be a capital expenditre in reproducing the plant. To use the working capital for the purpose of reproducing the business would require that it be replaced. It would dissipate the working capital and if used that way to maintain it, it would be necessary to have a new capital contribution. Working capital is a continuous, persistent item of primary capital.

1064 W. M. MORNING, being first duly sworn, testified on behalf of the plaintiff, as follows, pages 1102 to 1111, Vol. 1, original record:

Direct examination by Mr. Strode:

I am special counsel for the city in the prosecution of this suit and have been retained in the presentation of this case to the end. I assisted in the presentation of a bill presented to the last legislature authorizing and empowering the city to establish and maintain and operate a gas company. The bill I presented was finally enacted after several amendments. They did not substantially affect the bill. The bill was a general bill applying to all public service plants. An amendment was suggested which required the city to buy out any existing plant at a fair valuation to be arrived at by the process of condemnation. It was proposed to have the valuation determined by appraisers. I opposed that as an individual citizen for the reason that we thought the city ought not to be compelled to buy, but should be left free to do what was deemed best for the interests of the city. I did not have in mind the suit pending to put this company off the streets or to forfeit its rights. I did not undertake to get this bill through for the purpose of compelling the company to make a settlement with the city regardless of the justice of the terms. The only thing I had in mind in fighting against the amendment was the idea that the city ought to have the right to enter into the service of its own people on equal terms with the corporation and not be compelled to buy out an existing plant as a condition precedent, that the city

ought to be at liberty to deal at arm's length. Some of the people there were members of the municipal league of which I am a member.

Cross-examination by Mr. Foster:

The league was formed for the purpose of getting authority for the city to engage in public service business in certain lines, especially that of electric lighting. We had been in the past limited
1065 to an expenditure of $150,000 and were able only to light our streets and could do no commercial lighting and the primary purpose of the league was to get a bill through giving the city power to enlarge its electric lighting plant and while doing it we thought it best to get a general power. The municipal league gets back of candidates for city commissioner. I think they are pledged to municipal ownership of public utilities. I do not think this fact would jeopardize the investment of capital or affect the rates of return on capital invested. The city of Lincoln will buy the gas plant and pay a large bonus on its worth. I opposed any provision in the law being made to take it over at a fair valuation because I considered it unfair to compel the city to buy whether it wished to or not. The city is seeking to eject the company from the streets as the people here have had a great deal of trouble with public service corporations. They have had to sue for taxes and have had trouble with the service rates, and have had trouble with the quality of the product. In 1905 the gas was so bad it actually went out at the burner. There was no standard. I have never heard of any special complaint since that time. Then the rate question came up. All the cities around here were getting gas for a dollar or less, some in Iowa, and other places. I do not think the suit to forfeit the franchise right is being prosecuted to compel the company to submit to a reduction of its rate. It was an effort to clear the books and put the city in a position to negotiate with the company.

1066 F. W. Brown, being first duly sworn, testified on behalf of the plaintiff as follows, pages 912 to 913, original record:

Direct examination by Mr. Strode:

I was Mayor of the city of Lincoln at the time the dollar gas ordinance was passed. The only investigation I made to determine whether gas could be manufactured and sold in this community at one dollar and return a fair rate on the investment was a few inquiries as to the selling price of gas at other places, and the general demand of the people for dollar gas. I made no particular investigation and relied upon the courts taking care of the minority if not right.

Cross-examination by Mr. Morning:

I found gas selling in other towns of similar size, but not similarly situated entirely, for a dollar. Evanston was one of them. A special committee of the council had the ordinance under consideration and

John S. Bishop was a member of that committee. They made a report to the city council on the reasonably profitable price for gas and I do not recall to what extent their investigation went.

1067 R. C. OZMAN, being first duly sworn, testified on behalf of the plaintiff as follows, pages 914 to 919, original record:

Direct examination by Mr. Strode:

I am and have been City Clerk of the city of Lincoln since May, 1909, and I keep and have a record of the proceedings of the city council. They are made up following the proceedings of the council each week. There are fourteen members in the council. I have the record here showing what is called the gas quality ordinance passed by the council and approved by the mayor.

Exhibit 25 is the original ordinance relating to the 3% occupation tax passed by the council and approved by the mayor in 1909.

And I have here also a record of the council proceedings showing the passage of that ordinance. Exhibit 25 is offered and received in evidence.

The city of Lincoln has a municipal lighting plant in full operation by which it lights 100 miles of streets, the city hall, and fire stations throughout the city, and the pumping stations in connection with the water department. The lighting plant has been constructed out of money realized from taxation and is being maintained from that source together with some money which has been paid on machinery by the water department. In the natural distribution of taxes a portion of the occupation tax sought to be collected from the Gas company would be devoted to the maintenance of the electrice plant by the city. Prior to the installation of the municipal lighting plant the Lincoln Gas and Electric Light Company was under contract with the city for lighting the streets.

1068 Cross-examination by Mr. Foster:

The city is not furnishing light for any property or persons other than itself and during the day is purchasing electricity from the Gas company. We use lights at the city Hall on dark days. The city also gets its power for the elevators from the Gas company. The city light plant does not give any day service, nor does it manufacture gas. Part of the apparatus in the municipal lighting plant was purchased with funds of the water department. Both departments use the same machinery, first for pumping and then for lighting, and they are both located in the building at 27th and A streets, where is located the city water plant.

Redirect examination by Mr. Strode:

We use electric power to pump water furnished by the municipal plant. The plant runs both day and night but only furnishes current for street lighting at night, but furnishes power at the water station during the daytime. The city plant does not furnish power for the

elevator in the city hall because the voltage is such that we cannot use it in the elevator. It is not because of any kindly feeling towards the Gas company.

1069 HARRY L. SCHMITZ, being first duly sworn testified on behalf of the plaintiff as follows: Pages 3371 to 3409 original record.

Direct examination by Mr. Strode:

I live in Lincoln and am bookkeeper and have been for the past six years, for the Municipal Water Plant of Lincoln. I keep the record of the cost of labor entering into the maintenance and operation of the water plant, and the construction of the water mains. I have here the record showing the number of feet and the size of water mains laid by the Municipal Plant in Lincoln for the years 1910 to 1913 inclusive, and it shows the number of hours of labor and the amount paid for labor for the laying of that water pipe, and the total amount expended for labor. This data is taken from the reports handed in by the foreman of the construction work and it refers to the different districts in which he is laying pipe. A copy of this record was submitted to Mr. Adams, the city's expert about a year ago, at his request. Exhibit 402 is the summary of the amounts expended for labor in laying water pipe in Lincoln in 1910, showing the amount in feet of the different sizes and the amount expended for labor in laying it. In this exhibit I do not know what the item of $159.48, labor and drayage, is on. The materials read coal, oakum and oil, hydrants, plugs, offsets, L's and T's, reducers, crosses, valves, sleeves, cross valves boxes and one 12 inch sleeve. These represent the materials used and they are referred to as specials in connection with water pipe.

Exhibit 403 is a statement of the pipe laid in 1911, showing the size, number of feet and the labor cost itemized.

Exhibit 404 is a statement of the pipe laid for 1912 showing size, number of feet and the itemized cost of the labor. The item not there of Carters, is the work of our own teamsters and is in addition to the other item of teaming, 1081½ hours.

1070 Exhibit 405 is the record for 1913 showing the number of lengths, size and labor cost. These items represent the naked cost of the pipe in the ditch for labor and hauling. It does not include any of the overhead charges born- by private institutions.

Exhibit 406 is a statement of the material used in constructing a private service to the Beatrice Creamery Company, November 17, 1910 from the street to the building. That also shows the items of labor for that service, which was a total of $32.28.

Exhibit 407 is the statement showing the material, pipe and labor in laying fire services and four inch lines. The labor given is the total amount expended for labor for the services referred to in the exhibit. A length of water pipe is 12 feet, and for laying 384 feet of six inch pipe the city expended $496.29, which is a little over $1.29 per foot for the labor alone. That was done for fire services in 1912.

Exhibit 408 shows the labor account for laying 56 lengths of four inch pipe in December, 1913.

Exhibit 409 shows the material used in the construction of fire service and four inch pipe mains for 1913, and shows 35 lengths of four inch pipe, the balance of it being for specials, and then there was the hours of labor, which was $202.66, the naked cost of laying 35 lengths of four inch pipe without any overhead expenses. We used a trench 12½ feet long, 4½ to 5 feet deep and 18 inches wide.

Cross-examination by Mr. Adams:

My knowledge as to the actual work of laying the pipe in the trenches and as to the depth of the trenches is very limited, because I have seen very little of it done. The usual cover over the top of the water pipe is five feet of earth and with a four or six inch pipe, that means a depth of fully five and one-half feet. I am unable to tell you the exact dimensions of the section. I have never measured the depth of any of the water pipes nor the width of
1071 any of the trenches. Figuring a section as two feet by 5½ by 12½ makes 137½ cubic feet and $1.00 as usually paid by the water department for digging a section, which makes it amount to about .0072 of a dollar per cubic foot, or just about 20c. per yard. The figures which I gave on my direct examination include only the expense of supervision of the foreman laying the pipe, and the foreman in charge of the gang but do not include the salary of the water commissioner. He gave a good deal of attention to this work. He supervises both the office and field work. I do not think fire hydrants are commonly called specials. Exhibit 403 does not include any repairs, but if they put down a new main in place of an old one, it would be shown there. It only covers new and additional and extended water mains. If a length of pipe was replaced it would not be shown here. The water department in determining the length in feet of its mains laid, multiplies the number of lengths by twelve. Exhibit 403 represents a total of 26 jobs, which is an average of a fraction over a thousand feet on each job. The labor cost which I have given is over all the years and includes the taking up and replacing of brick pavings. The asphalt paving is handled by the city engineering department. It includes the cost of cutting through the asphalt, but not the labor of re-paving it. The labor cost shown in Exhibit 406 covers the cost of digging the trenches, laying the pipe and making the connection.

Redirect examination by Mr. Strode:

I really do not know the exact depth of the trench for water pipe, as I have nothing to do with the outside work, and in making the computation of a section on a basis of a trench 5½ feet deep I do not want to be understood as saying that the trench was that depth, nor 24 inches wide. As a general proposition, this water pipe is laid on unpaved streets. There can't be a house on the street
1072 without water. If the city has ever laid a water pipe under a pavement during any of the seven years I have been here,

I don't know it. The service to the Beatrice Creamery Company was under a paved street. That was a special instance where we undertook to do that work for the Beatrice Company and charged it back to them. In all cases the cost of services must be found by the property owners.

1073 *Testimony of Alton D. Adams Complete.*

1074 Mr. ALTON D. ADAMS, the City's expert called in behalf of the Plaintiff was duly sworn, and testified as follows:

Examination in chief by Mr. Strode:

Asked if he had a statement of the number of miles of gas mains in the City of Lincoln,—I have such a statement given me by the company, I haven't checked it up myself. I have a statement of the total number of meters, and I think, also of the meters in use, a statement of the entire number of meters was furnished by the company, and I have been investigating the company's records, the company gave me a statement of its total number of meters; I don't recall that the statement showed what portion of the meters was or is in use. I think that the record which I have compiled in the gas office from their books and papers show the number of meters in use. I have no statement as of this date of any kind of meters. I think the records from the company's books and papers show the number of meters in use and in stock, that is my recollection. On December 25th last year I had such a record as is contained in this book entitled "Transcript of Record, Supreme Court of the United States, October term 1911, No. 83; Lincoln Gas & Electric Light Company, Appellant vs. City of Lincoln et al." I had that on the 25th day of December 1912. My recollection is,—concerning any further record or information or data with respect to the number of meters,—that I had this statement from the company prior to that date about the total number of meters. That statement would be in writing. Whether at that date I had any information from the records, or otherwise, as to the number of feet or miles of gas mains in the city, other than the transcript just referred to, on the 25th day of December 1912,—I am not sure, I think I had the
1075 record spoken of handed me by the company, but would have to refresh my recollection about that.

On December 25th 1912 I had made no independent complete compilation of any inventory of the equipment, I had looked the plant over and investigated the inventory contained in this transcript I have already mentioned. Prior to December 25th, 1912, I had been over the plant and apparatus several times, I had made no written inventory. I had the larger items of the plant in mind. I got this part from my inspection and part from the plant. I got my information with respect to the number of miles or feet of gas mains prior to December 25th 1912 from the company, from the statement which I have spoken of; I feel quite sure it was handed me prior to December 25th 1912.

Concerning governors used by the company prior to December 25th, 1912,—I think I had a statement about the number of governors, from the company; I am not sure about these dates, I haven't refreshed my mind as to that. Whether that would be in writing in compliance with my request,—that would undoubtedly be in writing, not answering a part of your question. Not necessarily upon my request for my own information, it would be in writing at least.

Concerning any record of additional equipment, gas service or gas mains subsequent to the testimony contained in the transcript referred to,—I am pretty sure I had a statement from the company on these matters prior to December 25th 1912, which undoubtedly was in writing. I think I have some of those statements furnished me here. I have one of the statements of the mains, furnished me by the company, here in my hand; I have another one that is either here or over to the hotel. I haven't measured the mains, have no statement made by myself, I simply have the company's statement. Haven't made a tabulation of the number of feet of mains, I have nothing only these figures the company has
1076 given me. I have copied the various lengths of mains out of the report, I am only able to give the Master in this case now a statement of the number of feet of gas mains in the city of Lincoln owned by the Lincoln Gas & Electric Light Company, only these statements they furnished me. These papers, exhibits "1" and "2" give all the information there is except that in the Transcript of the Record I have already mentioned. I have other data drawn from the books and records of the company with reference to the number of feet or miles of gas mains, or the side of the main in the streets of the City of Lincoln of the company. I haven't that data here, yes it is here in the City, that is simply copies of the records of the company showing the size of the mains I think, I am making valuminous copies and would not attempt to tell you all they show accurately. Whether I know now, or have made any tabulated statement of the number of feet of gas mains in this city on the 25th day of December, 1912,—why, I never knew that. Whether I took any pains to arrive at how many feet of gas mains or their size, of this company, on the 25th day of December, 1912,—those statement- furnished by the company show that approximately, That (indicating) is the statement of October 31st 1912, but you are asking about December 25th, 1912, Christmas Day, an easy date to remember.

Witness handed papers to examine and state if that wasn't all the information witness had received upon his own requisition on the company for information as to the property of the company prior to December 25th, 1912,—answering the question as I go along, a large part of the papers handed me did not originate with the company. The first paper looks like my requisition, or a copy of it and was sent to the company for different items that I wanted information about. Referring to the next paper and whether that was not an answer from the company to the witness for information asked,—of course, I can't recognize these figures, but they look

like notes of information that was handed to me. I may
1077 not have given you all, I may have more over to the hotel the company furnished me, I think I have another but can't find it. I will get what information I have at the hotel or anywhere else, furnished me by the company prior to December 25th, 1912 and produce it here; that is what written information I have.

I have not prepared a statement showing the amount of property and value of the property of the Lincoln Gas Company. I have all the details shown in the Transcript of the Record of the Supreme Court of the United States. Besides the Transcript and exhibits "1" and "2" I have the details furnished by the company and on various parts of the property, I have already stated they are not limited to the papers I handed to you. I will produce those. I did not make a report on the valuation of this property as of the 25th day of December 1912.

Mr. ALTON D. ADAMS resumed the stand for further examination.

Examination-in-chief continued by Mr. Strode:

Witness asked whether he had here all the information and date furnished by the company to him, prior to December 25th, 1912,—no, it is not all here. I have here all that I could find here in Lincoln, but I remember I left some in the East. I wanted to say there was an explanation, or an addition to an answer I gave before lunch, that I wanted to make at this time, before it slipped my mind. I was asked about the schedule and list of property on the 25th day of December 1912, and I said I never had the schedule of the property on that day and never knew exactly what it was, meaning I never had a precise schedule of the property as of that date, and as I remember, I called attention to it in the next sentence that I did have statements of the company relative to considerable
parts of the property in October 1912, and I didn't want
1078 the impression to go in that I didn't have substantial information about the property on the 25th day of December 1912, although I didn't have a precise schedule on that date. As to what I did have on that date, well, I had the schedules of the property that I showed this morning as coming from the company, identified as exhibits "1" and "2". Witness asked if exhibits "1" to "5" inclusive are all the information from the Lincoln Gas Company prior to December 25th 1912, furnished by the company,—it is not. There was one or two blue prints of mains as I remember it, and I now recall no other written information aside from the schedules I have just produced. I think there were two blue prints of mains but I have left them in the East. All the statements or schedules from the company were furnished me prior to December 25th, 1912. My recollection is those blue prints showed both the miles or feet of mains, their size and also the location of the mains in the streets of the City. I used those blue prints as a basis for determining the number of feet or miles and size of mains, prior to December 25th, 1912 only in a general way. I looked it over, I relied mainly on the company's figures and on

the record of the Transcript. Outside of exhibits "1" to "5", and the blue prints, and what is contained in this transcript of the testimony taken upon a former hearing I had no other written information that I recall, furnished prior to December 25th, 1912 by the company, I had some general information secured from conversations with the officers of the company. Witness asked whether subsequent to December 25th, 1912 he had secured any further information from the company, or any other source, with reference to the property of the company, answered yes sir. I haven't that here, only partially, it isn't in shape to present. I have a great amount in process of compilation partially here and partially not. I have not prepared any statement or inventory of this gas company up to this time,—apart from the statements and inventories that I have already called attention to
1079 furnished by the company and obtained from the record. And that is these exhibits "1" to "5", the record of the testimony shown in the Transcript, and these blue prints. On one of the written statements of the property given me by the company there was a statement about the number of governors, that statement about governors is contained in a sheet attached to exhibit "5".

Whether I had any information furnished by the company, or taken by me from the records of the company prior to December 25th 1912, with reference to the gross receipts and operating expenses of the company,—I think I did. I don't think I have it all here, but think I have a letter here that bears on that point. (Produces Letter) there is a letter that fell into my hands, being a letter with reference to the net earnings to the company prior to December 25th 1912, outside of that and what is shown in this Transcript taken upon a former hearing, I had, as I remember a statement of the earnings and expenses for several years prior to 1912, a pencil statement, I have been unable to find it this noon. I think it was either furnished by the company, or Mr. Foster having obtained it from the company.

Whether up to this time I have taken or secured an inventory of the gas property,—would say various parts of it. I haven't taken any accurate inventory up to this time, the parts I have taken are shown in these exhibits "1" to "5", there are several sheets attached there to exhibits "2", "3" and "4", and a large mass of papers in process of preparation now at the office of the company in an incomplete state. Whether that is an inventory of the property or what the books show which I am referring, to,—it is what the books and papers of the company show the property to be. Concerning whether I have taken an inventory of the gas property,—I estimated the statements of the company and the records of its books with reference to parts of the property not readily accessible as proper
1080 proofs of an inventory, and so treated it in this appraisal that I have, and exhibits "1" to "5" and the statements at the office of the company. I haven't made up a detailed schedule of the parts of the plant at the works, which are open to inspection. It is not customary to measure up the mains nor to go around to all

the houses, and count the meters in making a schedule. I am telling you what an inventory is, I have taken the company's statement for that, number of meters, feet of mains and number of governors, the amount of receipts and operating expenses, and looked over the plant considerably. On December 25th, 1912 I had a great deal of this information I referred to now as being in the office of the company or in process of being put in shape in an,—I had a great deal of it in exhibits "1" to "5". Outside of exhibits "1" to "5" and these blue prints on December 25th 1912 I had compiled no figures at the office of the company in the way of an inventory. With the saving that I previously made that I may have left something besides the blue prints in the East, I have given you here all the data, outside of the blue prints, furnished me by the company, or taken by me from the books of the company, prior to December 25th, 1912. I don't recall anything that I left in the East besides the blue prints, if it was anything I presume in all probability outside of the blue prints, it would be a matter of small consequence.

Mr. ALTON D. ADAMS, a witness for the defendant City, having been previously sworn herein testified as follows on behalf of the City.

Examination-in-chief by Mr. Foster:

My name is Alton D. Adams; age 49 years; residence Natick, Mass. My business is that of Consulting Engineer. As to the line of work followed by me,—and my experience as an engineer,—I began engineering in the electrical field in 1885, and con-
1081 tinued to 1894, with a very slight intermission, and was continuously employed by various corporations in the design and construction of electrical plants and machinery; have designed machinery for various manufacturing plants to a very considerable extent, which was put on the market and sold by several manufacturing corporations and have erected electric power stations in various parts of the country. That employment by some specific corporation, ended in 1894 when I took up the business of consulting engineer on my own account and have so continued to date.

A year or two before 1900 I began to devote special attention to the affairs of public service corporations, to a study of their operations and plants, etc, before that my contact with such corporation had been merely in the way of erecting plants for them, or designing parts of such plants, since about 1902 or 1903 my time has been mostly devoted to the valuation of public utility plants and to various sorts of investigation of the affairs of such corporations, for various interests. I have appeared in a very substantial number of rate and valuation cases for different parties.

I attended the School of Engineering of Harvard University, Engineering Department. I graduated from the four year course, but spent only about two years there because I had spent two years prior in other schools, where I did not graduate, and subsequently went to Harvard School and took its degree there; the technical degree B. S. I had further work in connection with the Harvard

School and engineering, with my acquaintance with public service corporations to further prepare for that work I took a post graduate degree there, I took the full law course and graduated there in 1904 two or three years after I took the post graduate course, and received the degree of Bachelor of Laws at Harvard University, and I should like to explain that point, my incentive for attending Harvard Law School was the fact that I had become interested in the affairs of public service corporations and was convinced that I would
1082 never get to the bottom of such affairs until I understood something of the legal side; that was my motive for attending the law school and I have devoted a great deal of my time during my life to what you might call public service law. Concerning my experience in the valuation of public service properties in rate, valuation and tax cases,—I might explain that during the time I was attending the Post Graduate School and the Law School at Harvard I was still carrying on my business as a consulting engineer, which I have stated extends from 1894 to the present time; I make my living that way, and attending these schools was an incidental matter with me and to my business as an engineer; was constantly doing important engineering work during those years from 1900 to 1904 when I graduated from the Law School.

Now coming to my experience in public utility cases, as such, the first I now recall was a little gas case at Ashtabula, Ohio; I didn't go very far in that case because a settlement was made, it was a gas rate case, I did assist counsel, however, in that case with various figures and computations and of course was paid for my services; I didn't appear in any court proceedings in that case.

The next public utility case, as far as I remember, where I appeared was in the matter of the consolidation of the gas companies in Boston, a valuation of the properties and hearings were held before the Gas and Electric Light Commissioners of Massachusetts and arose in this wise; prior to 1904 there were some six or seven gas companies operating in Boston, according to their experts, their combined assets amounted to something like $25,000,000.00, they wanted to combine, and it was quite generally felt that they should be allowed to combine under proper regulations they brought in a petition before the Gas & Electric Light Commissioners of Massachusetts who had jurisdiction with authority to combine and the capital at which they might combine fixed, the object of the application was to see at what figure that should be fixed. The case run along several months, we had many hearings before the Gas &
1083 Electric Light Commissioners, a bill was brought before the Legislature while in session, it became apparent right away that the Legislature was likely to deal with the matter over the heads of the Gas & Electric Light Commission and that Commission suspended hearings pending the action of the Legislature, so that Commission never made any decision in that matter, but the Legislature did pass a bill fixing the capitalization at which those companies might consolidate, I think the capitalization was about $15,000,000.00.

One of the next cases in which I was employed, if not the next one,

was that of the City of Watertown, New York and the Watertown Gas & Electric Light Company. Those hearings were had before the original Gas Commission of New York State which antidates the present Public Service Commission and had jurisdiction of the whole state; that Commission was the original body which fixed the 80 cent gas rate in New York State which was subsequently taken to the United States Court in Wilcox -vs- The Consolidated Gas Company.

In the Watertown case the main proposition was one for the consolidation of the Gas and electric companies which had a combined capital at that time of about half a million dollars and they wanted to increase it to $2,500,000.00, the city opposed that increase on the ground that the property didn't warrant anything like it, and on the further ground that they didn't want the consolidation, it was bad policy so they contended that required extended valuation; we had many hearings, I spent a long time in that case; the hearings were brought to a close before the Gas & Electric Commission of New York, and the consolidation didn't occur, the Commission voted against it.

I think that Watertown case was in 1906 and the following year there was a rate case in Saratoga Springs between the city and the local Gas & Electric Company, that came up on a petition for a reduction of both gas and electric rates; that petition was heard before the old Gas & Electric Light Commission of New York. The
1084 City of Saratoga Springs got a reduction in the electric rate, I don't know what it was, but the gas rate before the order of the Commission was pretty high, making it possible to give such reduction, it seems to me it was up somewhere around $1.70; it was a very high rate; that case involved the valuation of both gas and electric properties as well as dealing with the matter of operating expenses of both properties.

One of the next cases I was in on behalf of the City of Salem, Massachusetts where I appeared for the City in support of a petition for a reduction of the rate; that was a gas case, that case came up before the Massachusetts Gas & Electric Light Commission. The gas plant was valued and operating expenses gone into and the outcome of that was a reduction in the price of gas.

About that time I made a report to the City of Woonsocket, Rhode Island, on the fair price of the gas there; involving an investigation of the situation and an approximate valuation of the property and consideration of the operating expenses, that wasn't a court or commission proceeding; I understand that the rate was subsequently reduced on conference or agreement or what not between the company and the City. I valued the plant. I don't know as I am getting these in their regular order, but somewhere about 1907 as near as I recall, I was employed by the City of Cedar Rapids, Iowa, in support of a rate of 90 cents per 1000 feet that had been fixed by the City's City Council, and was being opposed, I think, in the State Court of Iowa; in that case the 90 cent rate fixed by the City Council was supported by the State Court and subsequently in a decision of the United States Supreme Court.

In 1906 or 1907 I was employed by the City of Racine, Wisconsin in a gas rate case, that was a petition before the Wisconsin Commis-

sion on a petition by the City for a reduction in the rate of
1085 gas; that case was tried before the commission and I appeared; the gas rate was reduced, I don't remember how much the reduction was. My specific work in that case was an estimate of the operating expenses and of the depreciation and its effect on the value of the property; my recollection is that in that case the city to a large extent took the costs of the engineers of the Commission, some of them we disagreed with and deducted from those and dealt with it by way of depreciation to get at the values; we also objected to some of the specific costs and prices the Commission had used but there wasn't a complete setting up of new price for the property by the City in that case, only partially; the gas rate was reduced there to $1.00.

I had a gas case at Attleborough, Massachusetts. I appeared for the town of Attleborough, that case was last year; the gas out-put there is between fifty and sixty million annually; the result of that case was a reduction to $1.00 per 1000 feet; they make only coal gas, but a very fair quality, about 17 candle power according to the state test.

I appeared for the town of Lemonster and there they got a reduction of I think 40 cents, on a petition for a reduction in the price of gas before the Massachusetts Commissioners: that is a small place, the gas rate was high, we got a reduction from $2.00 to $1.60.

I have appeared in a case in Northhampton, Massachusetts during the progress of the proceedings in your case here, in fact I finished it shortly before I came here the last time, that was on a petition by the City before the Commissioners of Massachusetts for a reduction in the price of gas at Northhampton, we are still waiting for a decision from the Commissioners. We valued the property in that case and estimated the cost of gas, etc.

The Haverhill Gas Case was an important one that was heard intermittently during the entire year of 1911 before the Gas and
1086 Electric Light Commissioners, being on a petition of the City of Haverhill for a reduction in the price of gas; the output there is almost exactly the same as in Lincoln and is water gas only, they have no coal gas plant there unfortunately: the Commission last year, after the conclusion of the hearings in the case, fixed the gas rate in Haverhill at 80 cents per 1000 cubic feet: I should say a fair quality of water gas is made in Haverhill,—in Massachusetts we have a system of state inspection of the candle power of gas, the state inspector is one of the officials under the jurisdiction and control of the Gas & Electric Light Commission, he is required by statute and the regulations of the Commission to test the gas of different corporations all over the state and the number of tests depends on the output,—that is the larger companies are visited more frequently than the smaller ones the gas candle power at Haverhill, as I remember at the time of the hearings, was running somewhere around 19, the rate of 80 cents, as fixed by the Gas & Electric Light Commission for Haverhill for gas there, was appealed from by the Haverhill Gas Light Company to the Circuit Court of the United States and obtained a preliminary injunction against the City and afterwards

against the enforcement of that rate; that case is now being tried before a Master in the Federal Court of Massachusetts by the Attorney General on behalf of the Commonwealth; I am employed in that case by the Attorney General, in fact I ought to be there now, the hearings are going on from time to time and I am a witness in that case.

Within the period that I have been coming out here to Lincoln on this case I have valued the plant at Springfield, Illinois, of the Gas Light Company, and made a partial report thereon; the matter there, as far as my present knowledge goes, has been a matter of an attempted adjustment and agreement between the City authorities and the Gas Light Company; the rate there is $1.00 per 1000 feet, and the out-put substantially the same as it is here, within a few million feet per year; the City thinks they should have a reduction below
the $1.00 rate they are now getting, and an effort has been
1087 made to reach some agreement and that was the object of this
valuation to form a basis of some sort of an agreement. No agreement has been reached as far as I know what the outcome of the whole matter will be, in view of the fact that the Illinois Legislature passed a public utility bill last year, I don't know.

In the City of Ypsilanti, Mich., beginning sometime in the latter part of last year, I made a report to the City on the contruction of a new gas plant in that City; there is a gas plant there owned by a corporation and the corporation and the City have fallen out in their dealings, the gas plant is thought to be pretty old and somewhat run down, the City thought*ed* it wanted to build a new plant and obtained an estimate from me on the cost of construction a new plant; Later employed me to design and supervise the construction of such a plant and then a proposition came up relative to the purchase of the existing plant, that had to be passed on so that employment is temporarily held up until we see what the political outcome is.

The case at Melville, New Jersey was a tax case that I appeared in a gas and electric tax case. The City had taxed the property of the electric company and the gas company in Melville at a certain valuation, a regular property tax, and the company objected to the valuation put on those properties as being too high, and the matter had to come up before the state board having jurisdiction in this matter, I forget the proper name of the board; I was employed by the city to value the gas and electric properties in support of their valuation that they had put on it for the purpose of fixing the tax, I did that work. My understanding is that the tax rate was upheld, that the valuation not the rate, the valuation put on the properties was upheld, of course the rate was simply applied to all property in Melville, it wasn't a special tax as I understand. In Melville I also valued the water plant and electric plant for the City looking to a purchase; I don't think
the purchase has been consum-ated, they had competing water
1088 plants and the city thought it could buy the properties and
fix it up that way, that is why they wanted a valuation of the water and electric properties.

In the City of Racine, Wisconsin I valued the water works there for the purpose of selling to the City; the City is endeavoring to

acquire it under the Wisconsin law. The City is now being served by a private water corporation. I valued that water property, the property has not been transferred owing to the fact, as I understand it, that legal objections have been made in the courts which have held up the action on the merits before the Wisconsin Commission pending a decision on these various legal questions as to the rights of the City to increase its debt, and all that sort of thing.

I was connected with the valuation of certain National Civic Federation property. I was employed in 1906 and 1907 to report on the operation of sixteen plants, mostly electric, but partly gas in Massachusetts, eight of them being privately owned and eight municipally owned plants; the object was to get some figures and relative results of corporate and municipal ownership of said utilities, meaning private ownership, the work was done quite extensively taking many months and involved the valuation of eight of the plants,—the municipally owned plants,—we didn't value the privately owned plants, my instructions from the Federation were not to do that. There appeared to be objections on the part of the private corporations to having their plants valued, inasmuch as it was known that this report was to be printed in the record of the Federation and would become public property all over the country, it was thought unfair to value their plants and publish the results, so we simply valued the municipal plants and reported on the operating results of the privately owned plants. That report as to the plants in Massachusetts was made by two men,—It was thought at first it might be a joint report but didn't turn out that way,—and Charles F. Pritchard and myself each put in a report; Mr.
1089 Pritchard's and my own reports were published separate. Mr. Pritchard was the manager of the Lunn Gas & Electric Company.

I appeared for the District of Columbia in a case, I believe in the Circuit Court of the District involving the quality of the gas supplies by the gas companies, there are two companies in Washington, the case took considerable time and investigation of the case and the testimony about. The specific object was to enforce a very considerable amount of penalties the District had provided against the companies for failure to provide gas up to the required standards. That case came up somewhere around 1910.

I might mention among my earlier work in connection with public utility cases, that I appeared before the Industrial Commission a special commission created by Congress in 1900, and gave testimony on the operation of gas and electric plants in Massachusetts, my testimony there will be found in Volume Nine of the reports of that Commission, the report runs into twenty volumes I think: they had a great many hearings and took testimony in great length as to industrial operations and then the report was printed by the United States Government.

In addition to the various gas cases I have made valuations in a number of electric cases, have already mentioned the case at Melville.

In 1910 I was employed in an electric rate case by the City of

Montreal, Canada. About 1906 or 1907 I was employed by the City of Colorado Springs, Colorado in an electric rate case there. A year or two ago I was in a case in the City of Malden, Massachusetts an electric rate case. During the pendency of these proceedings I have appeared in an electric rate case for the City of Northhampton, New York, before the Commissioners. I did not make a valuation for all of these cases. Not all of them, in this last case I did. In Colorado Springs and Montreal none was required, it was a question of the fairness of certain rates which wasn't thought to require a valuation. Then for the town of Lemonster I had an electric case up there and down at Blackstone, Massachusetts
1090 an electric case there. Those cases were both before the Gas & Electric Light Commissioners. Those were rate cases for a reduction of the rates. As to the outcome I believe I last mentioned Lemonster and Blackstone there the rates were reduced; the Colorado Springs case the contention of the City was upheld, and in a sense the rate was reduced, the Colorado Springs case arose in this way: It was claimed there should be a large reduction in the amount of past bills that had accumulated against the City by the electric company because the service hadn't been up to standard of the contract between the City and the company. The question involved in that case was the value of the service that had, as a matter of fact, been rendered it being recognized and admitted by the company that the service had not been up to the standard the contract called for.

Concerning what study I have made in the installation of gas apparatus and the construction of gas properties,—well, in connection with the decade gas work I have outlined, of course it has been a constant study to familiarize myself with the construction of different gas properties I have had to deal with, that has been accompanied by a good deal of study on the general art of the manufacture of gas and apparatus connected therewith. I might say a word in that connection about the records of the Massachusetts Commissioners *of* Gas & Electric Light. The records of those Commissioners run back to 1885, much the oldest commission having jurisdiction of gas and electric matters in the United States, having been in existence some 26 or 27 years and then began in 1885 to exact reports from the companies on an extended printed form, one of which I shall be able to exhibit in this case; a report of the property of the company and all of its financial and technical operations each year. Those reports are all on file in the records of the commission and are open to any member of the public who chooses to go there at proper hours and investigate, and have undoubtedly *have* afforded
1091 the greatest source of information for the public in the United States as to the cost of operation, and incidentally putting light on the cost of construction, of gas properties. They throw a great deal of light and information as to the cost of making gas in the United States because they have been resorted to by persons from all over the country, they are a great bulk of public records that exist today relative to the cost of gas properties absolutely open to anybody that goes there at proper hours and

times to inspect them. Those records are made on printed forms, bound and printed pamphlets with vacancies left for answers to specific questions, to be filled out by the officers of the company and sworn to, and the statutes provide a penalty for a delay beyond one day's date. It is sworn to by the officers of the company. I have spent in the aggregate years studying the records of the Gas and Electric Light Commission.

Whether I have had anything to do with the case of Waterloo in the United States,—no I have never had any Waterloos in gas cases yet. I have never had anything to do with it in any shape or form.

Whether I have had anything to do with the matter of water power,—yes I have valued water powers quite a bit; I valued some on the Blackstone river, on the Susquehanna river, and several years ago had a very extensive water power matter on behalf of the bondholders, that case involving $45,000,000.00 on the Yadkin River in North Carolina.

As to what the various characters of property have had to do in common with the matter of engineering,—well, the valuation of construction, engineering construction have in common the fundamental principles of engineering; engineering is a science and art that applies to materials and structures, they go to make up,—from one point of view,—of course, it don't matter materially whether brick and steel and other materials of construction go into a structure for the purpose of forming a gas, electric or power plant of a water supply system, the same system of construction ap-
1092 plies to the market value of materials, with such variations as are incident to their different forms and control of the matter of cost.

As to what benefits, if any have been derived from the reports filed with the Massachusetts Gas Commission in ascertaining the life of property and apparatus used in the manufacture of gas,—that is one of the particularly valuable features, to my mind, of the Massachusetts, because of the form of the report is sufficiently complete so that engineers familiar with the gas business can read those reports and can go about and look at the properties and recognize the properties from the reports and trace the properties down through, now more than a quarter of a century of life, and see what the changes have been and thereby is created a record as to depreciation that is unexcelled. I have been doing that a great deal for the last ten years and made a great many records from it. I have repeatedly examined the property of the Lincoln Gas & Electric Light Company with a view of making a valuation of it. As to what examination of the company's property records, and books I have made and the time I have put on it,—I began to attend in Lincoln in the latter part of last year, have now forgotten the date would have to refer to my notes for that, being employed to come here by yourself (Mr. Foster) on the part of the City of Lincoln in this gas case, and have been here in the City of Lincoln,—apart from some work that I did when away from the City,—have been here certainly more than two months, perhaps as much as three right here in the

city. I have during that time repeatedly visited the gas works, can't say how many visits I have made, but enough to familiarize myself at least in general with the plant. Have spent a large portion of the time that I have been in Lincoln in an investigation of the records in the office of the Gas Company as to its plant, property and operations. Have spent a good deal of time in an effort to acquire a knowledge of the property of the gas company apart from the works, that is, the property scattered over the City of Lincoln under the streets, and I may mention, as I understand the testimony
1093 of the company's engineers, the greater part,—substantially more than half of the physical property of the Gas Company is spread over the City of Lincoln and is not down at the works at all. I am quite sure the valuation made by Mr. Lea shows over 60% of the physical value to be in what is termed the distribution system to a great extent is covered up and buried in the ground, and isn't readily open to inspection like building and machinery at the plant. I have given a great deal of consideration in an effort to arrive at a just a fair cost of what that property really is for a basis of valuation.

Then, of course, the vouchers of the company which run back to the year 1901, not back of that so far as I find, I have been through all of those years of vouchers and have made copious extracts from the bills since 1901 rendered to the company by various concerns from which it bought equipment. As to whether I caused any examination to be made prior to the year 1901,—I would say that it is impossible to do that. I made an extended search in the vaults and out of the way places for all of the vouchers we could find, we had a good deal of difficulty in finding these bills, not that I mean the company made any difficulty for us, but the bills were not filed in any regular way or place and we failed to find a large part of them, some were in a vault down in the basement nailed up in some old wooden boxes, entirely unsorted, and they had to be arranged and gone over before we could find what was in them. I can hardly dignify the assistance I have had from the company as to those vouchers by the name of a search, I don't mean to say the company has put any impediments in our way, I asked for all of them and they said all are in this miscellaneous pile, there was a vault down stairs and they said everything is down here now help yourself, we helped ourselves, and the company as to some special vouchers, have repeatedly given some assistance where I wanted a particular bill and in several instances found the bill I wanted, in one or two instances because some officer of the company had it. In general the policy of the company was to say our records were in such and such a place, go there
1094 and see what you can find, and help yourself. I did considerable for and questioning about these contracts entered into the past year for various parts of its gas equipment. Those contracts have only in part been discovered; I understand from the testimony of the company that they have all been turned over to me that have been available, a good many contracts have disappeared.

Then the regular books of accounts, such as ledgers, journals and cash books and some others have all been looked into with a good bit of care for the records of the structural cost of the property here, of course, those books are run under the names of the different one or two corporations that have preceded the present corporation, but the books are in the office — the company back to 1872 or 1873 when the construction of this plant was carried out.

Then the company — certain records as to the construction of its mains, I have made a considerable number of extracts of those and the process of investigating main work orders so called, which are orders to the foreman to lay specific pieces of gas mains in specific; these are still under investigation. The company has a very considerable file, I think nearly 700 of those work orders, which are on file in bound volumes and reveal a good deal of the fact relative to the part of the construction of the company's property. They are the best evidence, as far as they go, of its mains; but the orders appear only to begin about the year 1905 and run from there down to date.

The service cards are another source of information, I think they begin about 1905. The work of investigating these service cards, which are a written record on a little cardboard filed away, concerning the construction of service pipes from the main to the meter of some consumer, and contain a good bit of valuable information as to the size of pipe, its length and various other matters connected with its construction.

The company has a few drawings that have been made accessible to me, the files of the company are not very full in that
1095 respect, they are a source of information.

It has several maps of mains that have appeared in the testimony, those have all been considered by me.

Then the company has a special form of record called a gas report, being a specific form of record called a gas report, being a specific form of compilation as to its gas plant and particularly as to the operation of its gas plant, as far as I can judge for the purpose of showing the officials of the company, perhaps those absent as well as thcose present in Lincoln, what was the operations of the company from year to year. Of course, the figures that go into these so called gas reports are drawn from other records of operation of the company,—the station records, laying of mains, and various sources. I have resorted very considerably to those so called gas reports which are made out in the first instance month by month and later for the twelve months closed into the year. Those gas reports begin to be pretty complete about the year 1903 and continue down to date. So we have a pretty complete record of the operations of the company beginning with the year 1903 in those gas reports.

By operations I mean particularly the making of gas. These gas reports do not disclose, in any complete way, the construction of the property, for that you have to seek the bills, books and the plant itself as it exists down on block 79, and as it exists in the

streets of the City of Lincoln. I think that is a fair general statement of the scope of the investigation.

As to the condition of the company's construction account as it appears on the books and my investigation of it,—would say I have been over the construction account of the company, as it appears on the books, very extensively, in fact I have worked with Mr. Wiggins in the compilation of the account, which I understand he has presented here in evidence. The construction account appears on their books from about 1873 down to date.

As to what the requirements are in Massechusetts with reference to the issuance of securities by public service corporations,—
1096 as to gas and electric corporation- under the jurisdiction of the Massechusetts Gas and Electric Commission, the law since 1894 has permitted issuance of only such stock and bonds by gas and electric companies in Massechusetts as the Commission may approve and it is and has been, the practice in Massechusetts under that statute for such companies wishing to issue their stock and bonds to come in before the Commission and have a hearing, which is previously advertised, and they are required by the Commission in those hearings to exhibit and leave with the Commission as its record in the hearing,—those hearings are all public and stenographic reports are taken of all of them,—the companies are obliged to show the cost of the properties on account of which they *which* to issue securities. Are required to show their contracts with manufacture-s, for instance gas holder, water gas machines, and electric machinery. Are required to leave complete copies of the contracts and in the course of the proceedings are required to bring in the original signed contracts, so as to put specifically before the Commission the actual cost of the properties against which the capital is to be issued, and that is a part of the Commission's records and is the part to which I have referred this morning. That has been the practice since 1894, and not a dollar's worth of gas or electric stock or bonds can be issued without going through this process. In order to get that consent they must show the Commission the present total and detailed cost on account of which they ask for the issuance of the stocks and bonds, those records and hearings are open, to anybody who chooses to go and inspect them at proper times. That gives engineers who are interested a chance to inform themselves very generally what gas properties are costing in Massechusetts.

During the past year I have been employed by the New Hampshire State Commission which has jurisdiction of gas and electric properties in connection with the gas and electric properties at
Concord, New Hampshire, the capital of the state. That
1097 matter arose on the petition of the City of Concord to have a valuation of the property and employed me to do that work, that property there I understood to be controlled by the United Gas and Improvement Company. Some officials of that company came up there and we had one or two conferences between the commissions, the representatives of the Concord plant and myself, the upshot was that the valuation was not completed, the company made

the City a proposition for a reduction in the rate and that was accepted, the Commission wasn't moving on its own motion and when the petitioners were ready to have the case stop it stopped.

I was also employed in an electric case, a capitalization case, before the same Commission where a valuation of the electric plant and lines was involved, the question there being the proper amount of capitalization. That matter was completed and I reported to the Public Service Commission.

I have made a valuation of the Lincoln Gas Company's property used in the manufacture of gas, in the City of Lincoln. I have completed a valuation as of the date of January 1st, 1907, and I have well along towards completion a valuation as of January 1st, 1913, that valuation is not completed yet, that will take several days, I can't say positively but not very long.

Exhibit "180" which has been prepared by me, is entitled "Cost, depreciation and value of Lincoln Gas Plant, as of January 1, 1907"; it contains the figures relative to the cost as of that date and the depreciation and the value of the Lincoln Gas Plant.

I find the value of the Lincoln Gas Company's plant to be as of January 1, 1907, $279,915. That is shown at the bottom of the column in exhibit "180" headed "total value".

Explaining exhibit "180", it is in the form of a tabulation in four columes, the first left hand colume contain- the plant items, consisting of lands, buildings, works equipment, distribution system, and the combined items of engineering, interest, taxes and general 7%; the second colume is headed dollars, total cost, and contains the following entries set opposite the entries in the first column; land $2,250.00; buildings $22,247.00; works equipment $85,518.00; distribution system $229,125.00; the footings of the above quantities is the column is: $339,150.00; next below is an entry of $23,740.00 corresponding to the entry in the first column of engineering, interest, taxes and general 7%. The entry corresponding to the 7% is $23,740.00, making a total footing of the column of cost $862,890.00.

1098

The next column proceeding to the right hand in this tabulation is under the heading "dollars total depreciation". Opposite the item of land there is no entry. Opposite the item of buildings the entry is $5,585.00, intending to represent thereby the total accrued depreciation on the buildings that belong- to the Gas Company January 1, 1907.

The next entry in the column opposite Works Equipment, is, $21,717.00, representing the total depreciation accrued to January 1, 1907 on the works equipment of the company.

The next entry in said column opposite the words distribution system is $50,245.00, intending thereby to represent the total depreciation accrued on the distribution system of the company January 1, 1907.

The footing of the above amounts of depreciation in the exhibit is $77,547.00, to which is added the item of $5,428.00, representing the depreciation on engineering, interest, taxes and general.

The above items in the depreciation column foot up to $82,975.00,

representing thereby the total depreciation as computed here on the Lincoln Gas Plant as of January 1, 1907.

The total of the preceeding column $362,890.00 represents the sum total it would have cost to construct a plant the same as, or equivalent to, as the case might be, as to the specific pieces of apparatus or plant of the Gas Company on the first day of January 1907, using that date in the way that it must reasonably
1099 be used in connection with a cost of construction and the date on which the construction would be begun; it is impracticable and impossible to build a gas plant in one day, but the date of January 1, 1907 is taken as the date at which the prospective or substantial building of a plant would stand, and would make as fair an estimate of what it would cost him to acquire a plant the same as, or equivalent to, the Lincoln Plant as of that date.

The last column in exhibit "180" is headed: "Dollars, total value" and contains the following entries: Land $2,250.00; buildings $16,662.00; opposite works equipment $63,801.00; opposite distribution system $178,890.00 total footing of the above $261,603.00.

The next entry corresponding to engineering, interest, taxes and general, is $18,312.00.

The total footings for the total value column is $279,915.00. That completes exhibit "180".

Exhibit "181" prepared by myself is entitled "Depreciation of Lincoln Gas Plant as of January 1, 1907". It contains in general a statement of the estimated annual depreciation of the Lincoln Gas Plant as of January 1, 1907, a statement of the percentage of annual depreciation on the cost of the buildings, works, equipment, and distribution system, also with engineering added, and a statement of the total percentages of depreciation on those respective items:

On buildings the percentage of annual depreciation is 1.6;

The total percentage of accrued depreciation January 1, 1907 is 25.1.

And the dollars of annual depreciation of buildings is $370.40.

On works equipment the percentage of annual depreciation is 2.3; the percentage of total depreciation January 1, 1907 is 26.4 and the dollars of annual depreciation of works equipment is 2005.26.

1100 On the distribution system the percentage of annual depreciation on the cost is 1.8; the total accrued depreciation as of January 1, 1907, is 21.9; and the dollars of annual depreciation on the distribution system is $4131.58.

The footings of the above mentioned quantities are for column of annual depreciation 2.06; I should not speak of that as a footing-it comes in the next entry in the column of annual depreciation and represents the correct percentage of annual depreciation on the gas plant January 1, 1907.

In the column headed "total depreciation" the entry is 23.30: representing the total percent of depreciation on the entire plant as of January 1, 1907.

And the entry in the column headed "dollars annual depreciation" is 6507.24; representing the total dollars annual depreciation for the entire plant omitting the engineering, interest, taxes and general which is figured at 7% on the cost of the plant.

The engineering, interest, taxes and general item for percentage of annual depreciation is 2.06 corresponding to the combined plant to which it attached; the total percent of depreciation 23.30 corresponds again with the percentage on the combined plant to which it attaches.

And the dollars of annual depreciation on the engineering, interest, taxes and general is $455.50.

So that the footing of the column of dollars of annual depreciation representing the annual shrinkage in value of the gas plant as of January 1, 1907, is $6,962.74; that completes exhibit "181".

Exhibit "182" is headed "Ages and depreciation of Lincoln Gas Plant as of January 1, 1907". The exhibit is set up in five columns, the left hand column headed, "Plant items" contains a list of the items of the Lincoln Plant, except the land.

The next column headed "Years Assumed Life"; contains
1101 set opposite to each item the number of years it is assumed and believed may be fairly assigned as the life of the particular item against which it is set.

The next column, moving towards the right hand side, is headed, "Percent annual depreciation", and contains as a percent the depreciation which results from the years of assumed life, being computed by dividing the years of assumed life into the cost of the property item.

The next column, to the right, is headed: "Year old", and contains an entry representing the age in years of the time against which it is set.

The last or right hand column is headed, "Percent total depreciation", and represents the total percentage of depreciation of each item contained in the tabulation as of January 1, 1907.

Now to illustrate the application of the figures, the first entry "Purifying House"; the years of assumed life for that are 66.6 resulting in a percentage of annual depreciation of 1.5; that is a division of 66.6 into 100 gives the annual percentage of depreciation of 1.5; the age of the purifying house January 1, 1907 was 16 years; and the total percent of depreciation on the purifying house January 1, 1907 24% is obtained by multiplying the percentage of annual depreciation by the 16 years representing the age of the piece of plant or property. And that method of computation follows right down through as to all the other items in exhibit "182", the annual depreciation and the total depreciation being locked together, in every instance, by the factor representing the years age of the property on January 1, 1907.

There is this further as to exhibit "180", exhibit "180" shows the total value and cost of the gas plant as of January 1, 1907; it does not show an allowance for Working Capital, which of course, is necessary; it is my purpose if permitted, to supply figures for such an allowance at a later stage in the testimony.

1102 Neither does exhibit "180" give any allowance for the so-called development expenses, or "going value" which of course are elements of business value rather than plant value; they are closely related and probably run into each other, they do at least in my opinion; I don't think they are proper elements to consider at all in a rate case so I haven't included — in my estimate for those elements. I base my opinion on that point largely on my understanding of the court decisions, notable in the Wilcox vs. Consolidated Gas Company and other cases that I have rated; I think they excluded any allowance for the value of the business in a rate case, so I have included none in exhibit "180".

Mr. Strode: Let the record show that, in all his valuations he don't include anything for going value.

(Mr. Adams continues:) That method in all the valuation is the same, I haven't included anything in this exhibit. That is all I have to offer on exhibit "180".

Concerning depreciation I would like to state briefly in connection with exhibit- "181" and "182" that the method I have followed and the reason for the method in the matter of depreciation of the physical plant is this: depreciation is often spoken of and thought of in connection with the word "theory", I think the connection is more or less unfortunate; I suppose there is an element of theory about all opinions as to facts, but depreciation is certainly just as much a fact as anything we run on to in the physical world: property is like men, wears out and decays, and comes to an end after its useful life and in estimating depreciation as I have tried to do, it is necessary, I think, to, at the start, get into the fundamental idea of value. What do we mean by the value of a piece of property? To my mind the value of an engineering structure, like that of most physical things, is made up of two main elements, its utility and its usefulness for some
1103 purpose; and the time during which that usefulness can be enjoyed or had. The usefulness is an absolute element in measuring value and the time; one is just as necessary as the other.

To illustrate a little farther, perhaps to build a house is as good an illustration as any. The house is worth $10,000.00, it is worth $1,000.00 a year for a yearly rental, it is worth $100.00 a month for a monthly rental, it is worth very little to sit in for five minutes; so that the element of time in connection with the value of that house is just absolutely the fact that it affords a commodious and convenient shelter for the person occupying it. When we get the monthly and yearly rental fixed on that house we are getting the entire rental for that entire period of time, just as the selling price represents its entire value during its useful life as a house; and the selling price of the house is more than the annual rental because it will ordinarily last more than a year. The annual rental is 12 times the monthly cost value to be enjoyed. A year is worth 12 times what it would be enjoyed a month, and I should say the illustration applies to a piece of gas machinery, or gas mains in the streets or almost any other piece of engineering property; it is valuable because it can be used for a

certain purpose and it is valuable in proportion to the time during which it may be used. If what I have said is true, of course, it bears in a most certain way on the value of a piece of property that has existed and been used a part of its life. If a property cost $1,000.00 and can be used for a number of years, necessarily all the value goes out of that property, unless there is a little left for scrap, during that period of use. Suppose it can be used ten years, and for myself I can't conceive of any fairer rule, or one nearer the truth, that to say if a piece of property can be used ten years and with a substantially like usefulness during that ten years that it loses one tenth of its value each year and I say I can conceive nothing nearer the truth
1104 than that. And right there let me call attention to the further condition affecting machinery. Take a boiler, or water gas machine, the assumption that the value goes out of the machine as to the time of its use, in the proportion of the time of its use bears to its entire useful life, and particularly during the first half of its life a higher value than of any we have. If separated from the plant or situation where it is and is sold in the market, that is, you take a second hand boiler that might have a life of 25 or 30 years as a whole, take it after it had been used two or three years and sell that second hand and you will probably realize 50% of what a new one would cost. It is sometimes suggested that property loses during the early years of its use only a small percent of its value, let the pro rata percentage considering the time of its use in proportion to its entire useful life. I know of no foundation whatever for that suggestion. It is not supported by any idea that you could take the property out of the situation where it is and sell it again in the market and realize more than the pro rata remaining value in it is calculated on the basis of the lapse of years of life.

For instance take a boiler or engine used two or three years, that you will sell for 50 or 60%, its value drops in the market much faster in the lapse of years of life in their ratio of total life. I then think, however, it is proper to say a given machine after a period of use can be sold for anything like its new cost, which is an experience so general that I don't waste any time tarrying with it, everybody knows it. I don't think on that account a piece of plant should be depreciated at a faster rate than its years of lapsed life in and ratio to its years of total life, because I think we have to look at these things,—when we are valuing a public utility plant or any plant,—in every community as a whole to see what that would be worth to the man who wanted to carry on that business; and had the right to carry it on, in the
1105 situation where the things were, and I think the supposititious purchase, if I may use the illustration in that connection, would be governed not be the price at which the boiler could be jerked out of the plant and sold, but the *the* remaining period of usefulness that remains in that machine as compared with the period of usefulness that would be in an absolutely new machine. The market price of which is known, or estimatable, and so in computing depreciation I have taken it with the annual rate of depreciation which result, after I have used the figures simply by dividing 100 by the years of useful life it would have. I have taken it with the annual rate of

depreciation which has simply to be multiplied by the number of years the thing has been in use to obtain the total percent of depreciation and that the dollars of depreciation is to be obtained for each year, or for one thing that has an annual rate of depreciation is to be obtained by multiplying the annual percent of depreciation into the cost of that article new, and if the total depreciation of that thing up to any certan period of use is to be determined simply by multiplying the years of use into the dollars of annual depreciation. Now it seems to me that method of dealing with depreciation is particularly fair in connection with public service property which is really used for the benefit of the public which the public must repair from time to time as it wears out. A water gas machine we will say during its useful life is substantially as useful for the purpose of making water gas in one year as in another. Suppose it lasts for illustration 30 years, I see no reason why a consumer or group of consumers who have the benefit of the gas made in that machine should not pay back to the company that supplies that machine it- cost in 30 years and I see no reason why they should not pay back in proportionate amounts in each year. It seems to me that is the nearest approximation to the truth, of what it does cost in terms of a water gas machine for wear and tear to render that service we can get, and divided over a number of years we can use it to serve the public weal and get the amount the public ought to pay each year, and have a fixed application to the customer each year to repair that water gas machine that we could afford here, and to be constant and fair we must turn about and say that if it has been used 15 years that one half of its value, which depends on its usefulness for 30 years, is gone out of it; if the public has been paying a fair rate it has paid a sum necessary to replace one half of its value. It has used the machine during half the period it can be used according to our assumption; and the value so far as the public is concerned is half gone and I see no reason, therefore, why the public should pay a dividend on more than one half the value of that machine that they have paid to the company in the form of an allowance for depreciation one half of *the* its cost. And I see here no reason why they should continue to pay interest on more than ¼th of the remaining part until it finally loses its value.

1106

Right in that connection I would like to call attention to another physical condition, those are physical conditions all of the time. Of course, there is an element of assumption that enters into the life of the plant. We have to judge and conclude from experience how long a gas machine will last and there is quite a good deal of experience on that subject. We may be a little too high or too low but it is possible and practicable to estimate with fairness the number of years during which the public ought to pay back to the company the new cost of an article th-t the public has the use of. There is another crucial fact in this connection that is overlooked sometimes, that is that it is absolutely a physical impossibility to assume an even range of price to keep up and maintain as we say, the value of a specific plant or thing. It never has been done and never can be done, that is if you go around as we do in a rate proceeding and

enumerate all the articles you find in serving the public. It
1107 is impossible in the very nature of thinks, when the thing has just been installed, that those articles should have a value corresponding to their new cost; assuming an even range of prices it is possible to assume that prices went up between a certain period and boosted your plant, or that they went down and thereby dropped the existing value below what it would be if the price had been even. To as-ume an even price it is impossible to get any correct idea of physical thing by an original cost value. I think the value of a plant,—as we say, meaning by plant all the things engaged in carried on that portion of the gas business, for instance,—to be maintained? The only way it can possibly be maintained is by extending and by putting in bigger machinery, that is more valuable than the machines here on a certain date; or you may estend it by laying additional new mains, but extend it you must if you are to maintain the value it had on some specific date. And that, of course, is what we mean by maintaining the value of a plant. We can't go along here and find a plant that its value equals its new cost and find that this year or the next or any year. When we talk about maintaining the value of a plant I think we must mean,—and only can mean a plant,—taking a plant that existed at some specific date we have seen, that it expended enough on that plant to keep its value on what it was on that date in time past, and that date must be in the past. In other words if you look around you will see an aggregation of physical things that stood there with a value below the new cost, it must be so because they are wearing out or are partly worn out or are there ready for the scrap heap and if you want to keep the value up you have got to extend it and put in new and bigger stuff. It isn't sufficient that you put in new stuff by way or renewal. If you are going to take the value of a plant as of a certain date, you must extend it here by longer mains or bigger gas holders, and
1108 this principle applies to gas or electric plants or any other aggregation of physical things. That is substantially the end of my discussion of depreciation.

Mr. Strode: I want to ask whether this is offered for a substitute for the position taken by the City in the former trial in the testimony of Mr. Bemis, who favored the sinking fund theory. I would like to know whether the City is going to repudiate Bemis and accept Adams who favors the straight line depreciation, or take both of them?

Referee: I suppose the right of election may continue to the last, and may be continued to the end of the trial and permit the City to elect, this is a valuable right that can wait. To which ruling the plaintiff accepts.

Witness continues: I may say further in answering Mr. Strode that I didn't answer quite accurately in stating that I was through with depreciation, I was through with what I regard as depreciation, namely, that loss to the physical value that occurs to apparatus through time and use. I did want to say a word, however, following that about something that is sometimes called depreciation namely, the so called sinking fund theor-.

Referee: That is Mr. Lea's theory?

Witness continues: Returning again to the so called sinking fund theory about depreciation; it is very evident to me that the so called sinking fund theory has nothing particular to do with depreciation at all. You can apply it to life insurance and to the accumulation of any stipulated funds at any particular period in the future and the amount you must invest each year into your fund, you must get it into your fund or you don't build up your sum total at the end of the period. The amount you must invest each year varies with the rate of interest you assume your fund will draw. If you think you can get 2% it takes a long time; or if you think you can
1109 get 6% it takes a very short time. Perhaps I don't use the strict word if I say it is absurd to suppose the value of a steel machine, or brick building, or cast iron pipe laid in the ground varies according to the rate of interest some banks will pay on some funds. That is incredible to my mind that there should be any such occult relation in the shrinkage in value between a pipe laid in a main and the same fund accumulated in a bank.

Now the only connection I can see between the sinking fund method of computation,—and it is really a method of computation and nothing more,—and depreciation is this: that if you want to find out how much money you have got to put out at interest each year to accumulate a certain sum at the end of a period of years, the sinking fund table will give it to you, and that is all that it will give you. It won't tell you about the shrinkage in value of a certain piece of plant,—and of course your plant shrinkage to provide a certain amount each year as the period of usefulness goes out of it,—which can not correspond to the payment you would make into a sinking fund, where you would be earning not only simple interest but compound interest, and where the interest of each year would compound the next year and help to earn your sum certain at the end of the period so that you can see that the method of the sinking fund is a method of universal application; and if you want to accumulate a sum of money you can look into the tables to see how much that must be a year if you can get a certain rate of interest, and to my mind it has absolutely no connection with definite depreciation of a physical thing in some plant or in the ground, somewhere of course, we may assume that you are only going to get enough money to pay for each physical thing when it is absolutely worn out. And then again you are going to bring another thing into the sinking fund, which in the meantime you can make
1110 a computation about getting sums of money in year through help of a sinking fund but you can't get the value of a gas plant that way because so much of the value of the plant goes out each year in proportion to the years of use. If your money is in some bank earning a rate of interest it isn't being put into a plant and the value of the plant is not kept up, consequently the amount which the customer is bound to pay in interest and dividends is larger which is not kept up. So if it is practicable as it is conceivable to have the plant depreciation at an absolutely uniform rate through all of its element the result would be in the last year of the

life of the plant the consumer would not be required to pay much interest in the last year because there would be no value left to the plant it was serving. Suppose it was a 50 year life then a consumer would be called upon to pay interest on only 2% of the original cost. It would be impossible to carry on any public service at any such cost as that. It never was done and never can be, the gas pipe as a practical matter is carried on by constantly making additions to the plant. Almost in every case of extensions and invested money the consumer pays to replace the apparatus either by replacing it or by making extensions which add to the value of the property and that is the way the property is kept up and the company maintains the right to draw from the public a certain amount of dividends each year, which it could not do if the money was put in a bank somewhere at some rate of interest. So, I don't think, while the sinking fund method is a convenient way of finding out how much money you can get at some future time *but* putting a little in the bank each year,—I don't think you can keep up the value of a gas property or even keep running and furnishing gas by such a process as that,—in order to get your sum certain you have got to put your money into the bank and into the plant, in order to keep up the value of that plant you have got to put it into the plant and into the bank, so you are confronted with the two horns of the dilem-a.

1111 As to which method is usually adopted in actual practice,—the universal method in the gas business is to put the money into the plant and keep your plant up and keep adding to it. I have never heard of this wonderful one horse shay method of replacing a plant where they all go out in a wonderful collapse and then replaced by some sinking fund process.

Of course this is true of extensions and replacements necessary to keep up the value of a public service property as a whole and even to increase that value as often as happens are not absolutely uniform, for instance you *to* put in a large gas holder or machinery in some years that requires a greater amount than the proportionate amount that must be put into the plant each year, so you will find that well managed gas companies will occasionally accumulate quite a few dollars for a year or two and then it is gone, they put it into a big machine or extension that eats it up, so that picking out one year with another it equalizes, with the exception that occasionally you will accumulate a little money for depreciation and it may be a substantial amount, but in a very short time you have to take it out of the bank and put it into your plant or you can't keep up your business.

I want to explain this because I was asked to explain the method used in exhibit "182" and had just started to go through the purifying house.

Now coming to exhibit "182" as to what land I had included in this item,—$2,250.00 as shown by exhibit "180". I have included all land on which the gas manufacturing plant is located, the entire block. I made no division of that between the gas and electric plants because the land was all there and I thought the best thing to do was to get the figure for the value of it. It is perfectly obvious, that

a deduction should be made for the part of the land that is fairly in use by the electric department, but I had in mind the propriety of making several deductions from this cost and value col-
1112 umn after the items were all in there. I put in the value of the whole block but haven't made any computation as to the land that is used by the respective lines of business.

I did not include any land opposite that in block 79 on which the gas works are located, that was the only land that I found as of 1907 used in the gas business, the only land that the Gas Company owned at that time that I though- would be useful and suitable for the gas business. The company at that time owned a portion of lots 11 and 12 in block 77, diagonally northwest from block 79 on which is a dwelling house, but I didn't include that land because it obviously is not used for the gas business and very obviously not suited to be used by the gas business, most particularly because it is diagonally across the street, the area of the land is so small that would unsuit it. It might be assumed that they might acquire more land, but the great trouble is the land was situated diagonally across two streets and is not a suitable addition to the one occupied by the gas company. Referring to exhibit "221" the gas works now occupy block 79 and a part of block 76, although it does not show on exhibit "221", I am not testifying whether block 76 is owned by the company or not. I am simply informed that they do not so I haven't included it. It will be noticed that the railroad tracks run through block 79 and extend into block 76. In the event of extending the gas works to my mind the very logical extension of this extension would be to block 76, now considerably occupied by gas material and other stuff relating to the gas works. One of the corners is bounded by 2nd and M Streets and that diagonally across from that corner is block 77 and obviously would be very inconvenient if not impracticable to swing that spur of track around and get it to block 77; it would be inconvenient to carry on the gas works operations between blocks 79 and 77 diagonally across two streets. Of course, the thing could be done and if there was a strong reason for
1113 doing it like the occupation of all other real estate down there, but with all the vacant land in block 76 and in either direction from block 79 I can conceive no reason why block 77 would ever become useful for gas purposes, and so I have omitted it. I did not discover that the gas company was using block 77 in any way in connection with the gas business, for storage yards, material, etc., although a substantial part of block 76 is so used. it will be noticed that the spur track of the company runs clear across block 79 and nearly half way into block 76 so by practice the Gas Company appears to concur in the opinion I gave that block 76 is the logical and convenient location on which to extend the gas works.

In connection with exhibit "180" I want to explain the method of arriving at the assumed life of the property,—while the explanation is a little more pertinent to exhibit "182",—*be* before we get to exhibit "182" I might make the explanation I had in mind as to the assumed life.

The years of assumed life I have set down here for the various

classes of equipment that enter into a gas plant are as fair assumptions as I have been able to make from a very considerable observation of the period of use and age and looked at with a view of estimating how much longer it could be used. For instance I find a gas building used 30 years and look it over, we are having a life of 30 years and it is fit to live another 30 years. The years of assumed life used in Exhibit "182" have been made up in that way from such experience as I have gathered in the last decade, particularly as to the actual life of gas property I found in use and as to the probable time during which they could, and reasonable would have been in use. That is about all on that point, it is a matter of experience and judgment as applied to such property.

Of course the gas business is a little more than a century old, speaking of the world; it is a little less than a century in this country,—the first plants were installed in the early twenties in
1114 this country, and we have plenty of gas structures in Massachusetts that run considerably over a half century and from that to new ones only born yesterday, so while the period of gas supply is not long enough to afford a great number of instances where the longer lived parts of the property have lived their entire useful life, still the period has been long enough so that we, by following out the results in the way of replacement of property and their decay and a consideration of the conditions in which we find a property that has been in use a long term of years, we can form a very fair opinion as to what useful life ought to be assigned to particular parts of the gas plant and it ought to be remember- right there too, that if we make a small mistake in the assumed life of a gas property that it wouldn't be any man's one sided mistake, at least not in the way I have treated depreciation and value in this estimate, because, suppose I take the life too long,—my life of some part I have taken 100 years, for instance, cast iron pipe or mains,—suppose that only last 50, my 100 years will mean as a practical matter reduced to dollars, my computation will call on the gas consumer to pay only one half as much money each year for the replacement of gas mains as though the life had been set at 50. On the other hand my computation will only take the value out of the cost of the gas mains that are in the ground one half as fast as though I had assumed on a 50 year life. For instance, that 100 year life, if I find a gas main 25 years old that main still retains ¾ths of what it will cost to put in a new main to represent its value: and so the same method with the man who says that main has only 50 years of life he must say that 25 years is one half of 50 and the public must pay on only one half of the cost of that gas main, so my mistake made in estimating these years of life if you follow out this method of computating the depreciation I have followed here
is one that while it might work a small mistake it still isn't
1115 a one sided mistake at all. It acts both ways, as we sometimes say if the life is too long it calls upon the consumer to pay less in depreciation on the mains but makes him pay more in interest and dividends because it leaves a larger investment in the plant on which he has to pay a fair rate.

Concerning the source of information as to the ages given in exhibit "182",—the years of age in exhibit "182" opposite each class of gas property the bulk of them are derived from the records of the company showing when the structures was built, or when the machine was purchased. On a number of smaller items I have assumed the ages that were testified to by Mr. Brodnax and used by Mr. Lea in his valuation, in the main, however, I have satisfied myself particularly on the larger items from the records of the company when the item of the plant came into existence here. My ages will be found to differ from those given in the testimony in some instances, on that account, where I found differences between the records as I understood them and the testimony which had been given, I have assumed pretty generally that a mistake had been made by some other witness and that the record I found was a more reliable source of information and so adopted it.

Explaining exhibit "182" taking the per cent of annual depreciation in exhibit "182" I want again to call attention to the fact that those percentage- have been obtained in each instance by dividing the years of assumed life into 100. There is no variation from that rule in thic computation. Thus taking the purifying house 66.6 years has 1.5% depreciation; the purifying boxes taken at a life of 50 years have a 2% depreciation; and the shop tools taken at a life of 25 years have a 4% depreciation; and cast iron mains taken at a life of 100 years have a 2% depreciation. It is perhaps pertinent here to call attention to the way the depreciation has been computed on the cost of paving,—which is found in exhibit
1116 "182" on page 4,—of course, that figure for the depreciation of paving annually does not relate at all to the period during which the paving will last. I haven't attempted to express my opinion as to how long that paving will last. As I understand the matter the only interest at all the Gas Company has in paving is the fact that it covers some of the mains. Whatever value accrues to property through that fact may have disappeared when the main or service pipe covered by the paving has lost its value, when the pipe is no longer valuable to send gas through. It don't matter to the company whether they have paving or not. So on the annual per cent of depreciation applied to the service class of pipe, main and service, is applied again to the cost of the paving, over that particular class of pipe. Now the per cent of annual depreciation and the per cent of total depreciation stand to each other, in every instance, as it stands to the age of the property. In other words, take the per cent of annual depreciation and multiply by years and you have the per cent of total depreciation to be deducted from the new cost of that piece of property. That method is followed without variation through entire exhibit "182".

Exhibit "182" I may say, includes what I understand to have been the entire physical property of the company on the first day of January 1907. It begins with the building and then follows the various items of works equipment; then the distribution system, the latter being made up of cast iron mains, steel mains, service pipe, meters, and the paving over the several classes of mains.

As to the buildings and the items in the works equipment I have been guided in part by an actual inspection of the property,—of course, some of the items are so obvious there can be no doubt whether they are there or not,—in part by the testimony of Mr. Malone and Mr. Honeywell given in the previous proceedings in this case; and in part by the testimony of Mr. Brodnax and Mr. Lea in this proceeding. I haven't attempted to verify each one
1117 of the smaller item- of property by actual inspection of it, but have assumed the property, being stated by some one of those witnesses that which existed, in a number of instances without going there to see whether I could find it or not. That applies to the small items of property that are not necessarily visible when you go down there. I have in the majority of cases even as to those items, relied on the record. That was another reason for accepting the statement of other witnesses because I found in some past time the company had appliances, or such a piece of property and the only question would be, apart from the testimony, whether they had parted with it or still had it. For instance if a witness said it was it would be creditable to accept the statement; at least I thought so, and in that way the list of all buildings and works equipment has been made out.

In the distribution system more stress has been laid on the records of the company, as they exist in the office of the company than on the list of works equipment, for instance, because the company in the gas reports have set out year by year the amount of mains in feet and size and the number of meters they have in use, and show what was added during the year. That method hasn't been followed as to works equipment, for instance, as to buildings; those items are not set out systematically year after year in the so called gas reports, but mains, meters and service pipe are. In the matter of mains, meters and service pipe it was necessary to adopt some other method to determine the age of a specific piece of property, as for instance the purifying house; that house was built in 1890 and so giving the company the benefit of a fraction of a year which I have done in all of these cases or intended to, it is 16 years old. My method of computing those years from the records of the company was this, if they bought a piece of plant or machinery, to figure it out in age at the end of that year I didn't
1118 bother with a fraction of a year; that is a slight assumption in favor of the company. For instance if a building was built in 1890 simply subtract 1890 from 1906 as I did in the purifying house, leaving 16 years the value being as of 1907, which corresponds substantially as the last day of 1906. In dealing with mains, service pipe and meters, which are to a very large extent alike in kind and very dissimilar in age, it becomes necessary to vary that method somewhat and the figures in exhibit "182" for the ages of the different classes of property I arrived at by a computation, not by simple subtraction as I have just explained, and I think that method of computation might perhaps well be taken up now as anywhere, it is shown in a later exhibit also.

I will now ask the court to look at exhibit "187" on page 12 of

this document and also on page 13 of exhibit "188". In fact I think exhibit "188" is the only one I need to refer to in explaining the years of age for the meters, mains, and service pipe. Exhibit "188" is made up of two tabulations, one showing the cost and value of gas mains as of January 1, 1907 and the other the cost and value of steel gas mains as of January 1, 1907.

Now taking on page 13 of exhibit "188" in the column headed "Cost" in the tabulation of cost and value of cast iron mains as of January 1, 1907 there are certain costs opposite the years 1903, 1904, 1905 and 1906; those costs as to the year 1903 are the estimated cost of the mains laid in the ground that year, and as to the years 1904, 1905 and 1906 the same; there is also in that column of cost a large item of $62,978.00 corresponding to the entry "before 1903", that being the estimated cost of the cast iron mains that were laid by the company before the year 1903; the records of the company do not disclose in any direct way in what years those mains were laid.

Answering the referee as to where I get that amount of $62,978.00 would say that involves an explanation of how the cost of the mains was computed, in exhibit "186" page 11 in the right hand
1119 column headed "Total cost" and the section entitled "before 1903" you find cost $62,978.87. I would like to call attention now where it comes from. It is the estimated cost of those mains that existed before 1903, and when I come to deal with the cost exhibit I will endeavor to show how it is made up, I am now trying to show how the depreciation and life was gotten at. So I come back to exhibit "188" where I take cost of mains laid in the respective years and in the last column, moving to the right hand, "years old" meaning on the first of January 1907 for the mains that were laid in each year and also the mains that existed before 1903.

Now those "years old" are obtained in this way,—again I included in favor of the company the fractions of a year and only where it is a fraction of a year old as its having no age year. Taking the entry opposite the year 1906 no years of age are assigned to those entries of cost. Those entries opposite each year are the cost of the mains that were laid by the company in that year. Now on the first of January 1907 the cost of the mains means their cost at no age as I have set it down in this tabulation so no depreciation is to be deducted for that investment in mains; the mains laid during the year 1905 on the first day of January 1907 would actually have an age of one year and some months but I put down the one year; mains laid in 1904 have an age of two years as concerned with the end of the year 1906, that is January 1, 1907; and mains laid in 1903 have an age of three years, and that is as far back as the specific and complete records of the company go as to the laying of mains, but the records do show and there is testimony in this case to show what mains existed prior to 1903, that is, in 1902, and I would say that the mains laid in 1902 would have an age as compared with January 1, 1907 of 4 years, but between 1902 and the beginning of laying of cast iron mains of this company and its predecessors as shown by the books to some
1120 extent, and more clearly by the minutes of the directors meetings there intervenes a period of 26 years, that is, the company

owing to the failure of its early wooden mains was obliged in 1876 to discard the old wooden mains and lay cast iron mains and they made a contract with their superintendent a part of whose duties was to superintend the laying of the cast iron mains. As are intervened between the years 1876 and 1902, 26 years, it is an assumption,—more favorable to the company than the truth can possible be,—that the mains laid during the period 1876 to 1902 have an average life of more than one half of that period, more than 13 years, that is necessarily so because in starting a gas plant you start in and lay a good bunch of mains the first thing you do and get ready to serve the people over a considerable area, and that means you don't lay the mains proportionate to the life of your plant, that is, if your plant is 10 years old and you have 10 miles of mains you don't lay a mile of mains a year by any means but you lay it faster in the earlier two or three years. I have excluded that necessary method of construction a plant, the necessary rate of construction which must be more in the early years, and have simply assumed an average life between 1876 and 1902 of those mains, so simply one half of the period,—obviously if they laid their mains pro rata each year an average life of those mains would have been 13 years. We know as a matter of practice in carrying on the business they would have to bunch the mains in the early years. I have made no allowance for that but have made an assumption more favorable to the company is saying that these mains at the end of 1901 had an average life of only 13 years.

Concerning the size and character of those mains laid in the earlier years as compared with those laid in the later years, would say this isn't quite the place to bring that in; in fact I can answer your question sufficiently by saying that this cost of mains which I have
1121 set down, takes care of all of that which according to the gas reports of the company and according to my figures, of the mains existing at the end of 1902, for the cast iron mains alone was $62,976.00, whereas on the first of January 1907 the cost of all the cast iron mains of the company estimated with the same unit price was $73,175.00 showing that the company at the end of 1902 had laid $62,978.00 out of $73,175.00 worth of cast iron mains figured at my unit price. If you raise the unit price and say I am to- low it means that the cast iron mains laid prior to 1902 were still more valuable.

I have said the investment in mains prior to 1902 was on the average 13 years old and I have added to it the 4 years shown on exhibit "188" and the mains laid in 1902 which have an age at the beginning of 1907 and that is the time the 13 is added to the 4 years at the head of that column headed "years old".

In the next column on exhibit "188" is the percent of depreciation resulting from the years of age which the mains have, that is, the mains laid in 1905 would be one year old the first of January 1907 according to the computation, not figuring the odd months. And the mains laid in 1904 would be two years; those laid in 1903 would be three years old; and those existing before 1903 would be 17 years old on the average taking the average of investment in the average of foot years as we might say, so the column of which are depreciation

totals, not annual, in exhibit "188" for cast iron mains reads, beginning at the top 17%-3%-2%-1%-0% the last corresponding to the year 1906. That percent of depreciation being 1% according to a life of 100 years, 1% a year is figured on the new cost of the mains as exhibited in the cost column in that table, that is, 17% is taken on the $62,978.00 to get the $10,706 shown as the first dollar entry in the next column headed, "Dollars of depreciation January 1, 1907"

1122 in the same way 3% is taken of the $497.00 cost of mains laid in 1903; 2% of the $2,260.00 cost of the mains laid in 1904; and 1% of $5,672.00 cost of mains laid in 1905, that isn't 3% of the amount in mains, that is the cost of the mains themselves, 3% is $14.00. So that column "Dollars depreciation January 1, 1907" reads from the top down as follows $10,706.00-$14.00-$45.00-$56.00-$0.00 and the total footing of $10,821.00 is for the depreciation on those cast iron mains on the first day of January 1907. That depreciation is deducted from the cost of said mains in their respective years to get the last or right hand column in the exhibit "188", which show the value of cast iron mains laid in 1903 on the first of January 1907 of $52,272.00 and so on in the subsequent years resulting in the following on the first of January 1907 $62,354.00 for those mains.

Going back to exhibit "182" where the "years old" for cast iron mains is 14.7, that 14.7 is computed by dividing the annual depreciation of these mains, which is 1% of their total cost into the total depreciation of $10,821.00.

The figure of 14.7 is not used in computing this final figure set down but gives a convenient idea of the age of investment in mains and is obtained in just that way. Now the question as to the years when the mains were laid can be answered now rather than anywhere else. It appears from exhibit "188" that the cast iron mains which are the mains of large cost per foot, are the mains that were laid mostly before 1903, and it is for that reason that any computation based on the average age of those mains by feet is a result of getting the foot years of the mains and dividing that by the total feet and is not at all representative of the age of the dollars put into those mains. Since 1903 the company has been laying mostly 2" steel pipe, a pipe of the size and kind of a relatively low cost as compared with 4 to 20

1123 inch pipe it laid before in cast iron mains so that if you consider the foot year of all the mains laid and consider the number of feet laid on the average per year and get at the average that way you get a much younger looking set of mains than as though you considered the dollars invested to build those mains and get the average age for what I call the investment on the basis of January 1, 1907 price. I will show why that is very strongly so in a moment.

Calling attention to page 8 of exhibit "211" found in the folder entitled "Cost Exhibits", the exhibit is headed "Length of mains at end of 1902 and 1912 per gas reports". Those figures being taken from the gas reports that have been systematically kept by the company setting out the feet of mains each year. That record begins with the end of 1902 and with the first of 1903.

The mains there were divided in three classes, the size is set out in the left hand column. One class is the 2 inch size which stands by itself; another class is the 4, 6, and 8 inch size which are added up as to the length and the third class is composed of 10 to 20 inch size which are also combined. At the end of 1902 the length of 2 inch mains was 140,875 feet; the length of the 4, 6, and 8 inch mains, combined was 82,103 feet; and the length of the 10 to 20 in mains combined 15,750 feet.

The next column of that tabulation show the feet at the end of 1912 for each of those classes of mains. The 2 inch mains at the end of 1912 had increased to 357,067 feet; the 4, 6 and 8 inch mains had increased at the end of 1912 to 38,721 feet; and the 10 to 20 inch mains had increased none, it was just as it was back 10 years previous in 1902 or 15,750 feet. The next column is headed "feet of increase to 1912" that means 1912 inclusive. For the 2 inch mains the feet of increase is and shown to be 216,192 feet; for the 4, 6, and
8 inch mains 56,618 feet; there was no increase whatever
1124 during that period of 10 years for the 10 to 20 inch mains.

The final or right hand column in this exhibit "211" shows the percent of length in 1902 to that of 1912. This figure is obtained by dividing the feet of length that existed in 1902 into that which existed in 1912. Taking the 2 inch size, that appears as 39.1% of the length existing in 1912 which existed in 1902; and the 4, 6, and 8 inch size combined 59.5% of the total length existed in 1902 which existed in 1912; and for the 10 to 20 inch size of mains 100% existed in 1902 of the amount that existed in 1912.

Exhibit "212" on pages 9 to 13 is a rather extended computation. Taking page 10 first there appears in this exhibit "212" a tabulation headed "Amount paid for cast iron pipe per books and bills", the first on left hand column is headed "years and vendors" meaning the seller- of the pipe. The next column is headed "date". On page 10 the dates are principally lacking but will appear in later pages, due to the condition of the records and not to the fault of the copyist. The last column is headed "inch size" in which is given as far as the records cite the size of the purchases in those years. The next column is headed "Dollars price per ton", that is rather vague until you get over into the exhibit. The final column is headed "Dollars total cost" and that of course is the point of the exhibit, to show the amount of money the company has paid for cast iron pipe. This isn't for mains laid in the ground, this is simply the purchase of the cast iron pipe, assuming that the cast iron pipe purchased by the company has been substantially laid in the ground or down at the works, the company wouldn't have any other purpose than to put it into the ground or into the works.

Now the first purchase of cast iron pipe that record reveals is in 1876 from Dennis Long & Co. and I have assumed in making up this exhibit that the bills from the makers of cast iron pipe or the
book entries showing payment to makers of cast iron pipe
1125 represented the purchase of pipe. It is the best way
of getting at the fact that I know of. The situation is this, here is a gas company that want- to and is laying cast iron pipe and

here are vendors of cast iron pipe such as is used by gas companies and we find large and repeated entries in the early years and letters that go between the gas company and these vendors, and it is reasonable to assume that the purchases of the bills entirely at least, of the cast iron pipe was for pipe, and this is the basis we have assumed because we haven't the specifications of the pipe bought. I only had to make that assumption on a few. The basis of the assumption is, where the size of the pipe don't appear and where the book entries don't say what it is for, if we have a very brief entry in the construction account that a certain amount of money was paid to Dennis Long & Co. in 1876, showing $1,397.09 paid to Dennis Long & Co. and charged into the construction account. Dennis Long & Co. as we shall show was a maker of cast iron pipe and I have made the assumption that $1,397.09 was for cast iron pipe, that is the basis of my assumption and there are only a few entries where that didn't appear where that is the basis of it.

From 1876 to 1912 inclusive we show the total purchases of cast iron pipe during those years. I have no voucher numbers for these earlier years, when the bills began in 1901 we got some bills. I haven't the voucher numbers, I have the date the purchase was made, the month, day and year. I think it shows the number of bills that go to make it up, because it shows the separate entries. The purpose of exhibit "212" is to show when the investment of cast iron pipe was made in the main. We do not claim to have gotten every purchase of pipe but think we have the most of it.

On page 9 of exhibit "212" after having set out any detail that we had, the size where possible, the total amount of the bill and the name of the seller of the pipe for each year, there is
1126 combined on page 9 the footings for the various years and they are added up down to and including 1892, from 1876 to 1892; the footing for that period of years is $41,203.81.

Starting again with 1893 on this same page and coming down to 1912 it appears that since 1892 there was a further investment of $20,363.21 from 1893 to 1912 both inclusive. The grand total for the period from 1876 to 1912 for all the cast iron pipe purchased, that we have been able to find, is $61,567.02, and of that, there was invested between 1876 and the end of 1892 $41,203.81 out of the total of $61,567.02 paid for cast iron pipe during the life of the company. We don't claim that is all the company paid for pipe; we think it is most all, but the main purpose of the exhibit is to show when the purchase was made, namely, that the bulk of the cast iron pipe,—⅔rds of it substantially,—as far as the records will reveal was bought more than twenty years ago, 1892. They had paid for ⅔ rds of all they ever bought as far as we were able to find in 1892. This exhibit is designed to support my deduction on depreciation and show that any computation based simply on the foot years of pipe in the ground fails to properly allow for depreciation because the big expensive pipe costing big amounts per foot was laid years ago and the cheap pipe costing a few cents per foot or relatively a small amount has been laid in great quantities in the last ten years. I am stating my conclusion on what I have

found. I have searched the record and found all I can in that record. If you will show me that my search has been incomplete or inaccurate all right, but I have found all that I could.

I left out of my explanation of exhibit "212" a matter I want to add a little further as to the purpose of that exhibit. The exhibit was prepared for two purposes, one to show that the bulk
1127 of the investment in cast iron pipe as far as we are able to trace it, was made more than twenty years ago and the cast iron mains looked at from the standpoint of investment, for a considerable age and depreciation resulting from that age.

Then the further object of exhibit "212" was to attempt to show what weight of pipe per foot has probably been used by this company, because I believe it would be a fact that the pipe in the earlier years,—back of 1892,—was of a distinctly lighter weight of pipe, weighing less pounds per foot than that since that time and if the greater investment of pipe was made during those earlier years, and I am right in my opinion that the pipe at that time was substantially light- than it is now or has been in years since then, the fact that the greater part of the investment was made in the earlier years would show that they had a lighter pipe then than is being put in now for the company's use. I have another exhibit which shows the weight of the pipe.

Now continuing the explanation in connection with exhibit "188" on page 13 of the valuation folder, in relation to the age given for pipe and in exhibit "182" page 4 of the same folder I called attention to the tabulation on page 13 entitled "Cost and value of Lincoln cast iron gas mains as of January 1, 1907".

Now this tabulation, "Cost and value of Lincoln steel gas mains as of January 1, 1907" is prepared on exactly the same plan or scheme as the table headed "Cost and value of Lincoln cast iron gas mains as of January 1, 1907" and the first left hand column contains an entry of "years laid" first before 1903, and then following in order 1903, 1904, 1905 and 1906.

The next column headed "dollars new cost January 1, 1907" contains, as against the entry "before 1903" $26,338.00 being the cost I computed of the steel mains that have been laid up to January 1, 1903.

Then for the year 1903 the cost is $4,663.00; for 1904 $1,396.00; 1905 $3,323.00; 1906 $3,984; making the total for that column of
$39,704.00 as the cost of steel pipe existing on the first of
1128 January 1907.

Starting again with 1906 in the column headed "years old" no age is assigned for the pipe laid during the year 1906; for the pipe laid in 1905 one year old; 1904 2 years old; 1903 3 years old; and before 1903 13 plus 4 years total 17 years.

The next column is headed "percent of depreciation" and is made up by multiplying the years of age respectively by 2. I assume the life of a steel main here in Lincoln to be 50 years and that results from the method of computing I have explained in a 2% annual allowance on the cost of such a main for its depreciation. The re-

sulting percentages of depreciation are then: for 1906 nothing; 1905 2%; for 1904 4%; for 1903 6%; and before 1903 34%.

These percentages of depreciation for the respective years are taken on the cost of the mains laid in those same years to get the entry in the column headed "dollars depreciation January 1, 1907".

The dollars of depreciation on the steel mains laid before 1903 appears in this column as $8,954; mains laid in 1903 depreciation $279.00; 1904 $55.00; 1905 $66.00; 1906 $00.00; so that the footing of the column headed "dollars depreciation January 1, 1907" is $9,354.

Now these allowances for depreciation in the respective years are deducted from the estimated cost of those mains for those same years to get the right hand column in this tabulation "dollars value January 1, 1907".

To illustrate, from the cost of the steel mains laid before 1903, $26,338, there is deducted for depreciation $8,954.00 being 34% to obtain the value on January 1, 1907 of $17,384. Whereas to illustrate again, the mains laid during 1906 the cost of $3,984.00 is carried right through into the value column at $3,984.00 there being no deduction for depreciation because the mains are only a fraction of a year old.

1129 Making a total footing of the value column for steel mains as of January 1, 1907, $30,350.00.

Going back to exhibit "182" on page 4 of the same folder the 14.7 per cent depreciation on the cast iron mains there shown is obtained by dividing the total computed depreciation in the way I have indicated in exhibit "188" by the cost of those mains in all of the years, that is, the footing of the cost, and the percentage of 23.5 on the steel mains for depreciation is obtained by dividing the total depreciation as of January 1, 1907 amounting $9,354 by the total cost or $39,704.

The years old for those respective classes of mains can be obtained by dividing the annual depreciation figured on the new cost, that is 1% of new cost for cast iron mains and 2% for steel mains into the total amount of depreciation estimated on those respective classes of mains.

I am not going to discuss in detail the cost of service pipe and meters now but want to show how it was obtained, briefly.

Exhibit "193" entitled "cost of service pipe laid each year as of January 1, 1907" contains a list of the number of service pipes laid to the meter first before the year 1903, and then for each year subsequent to 1903,—these numbers of service pipes so laid was obtained from the gas reports, part of the records of the company and also the number existing before 1903; that number was 2911 to the meters. Now in each year the number of service pipes laid in that year is shown in exhibit "193" and is multiplied by $8.58 to obtain the cost of the service pipes laid in that year, that is, service pipes laid at some unknown time before 1903 being 2911 in number are multiplied by $8.58 to obtain the total cost of $24,976.38 for those service pipes, that method is followed through for each year. Taking the year 1903 the service pipes laid in that year to the meter was

691 that number multiplied into $8.58 gives $5,928.78, the cost of service pipe laid during the calendar year of 1903; and fol-
1130 lowing that method down through to 1906 inclusive taking the footings as shown in exhibit "193" gives $45,834.36 as the cost of all those service pipes as of January 1, 1907.

Going now to exhibit "194", page 18, the cost just found in the respective years are set up in a table headed "depreciation and value of service pipe laid each year as of January 1, 1907".

Beginning on the left hand side with column headed "years" first before 1903, and then 1903 and so on down to 1906.

Then the column of cost headed with $24,976.00 being the estimated cost of the service pipe laid prior to the year 1903; the next column headed "years old" which for the service pipe laid prior to 1903 has an entry of 13 plus 4 being made on the same assumption that was had for the mains, that is that the service pipes were laid pro rata with the mains; that probably isn't absolutely correct it may vary one way or the other, I think it is a fair assumption. The average age of service pipe laid before 1903 taken to be 13 plus 4 equalling 17 years, and the age of those laid during the year 1903 is 3 years and so on down to nothing in 1906.

The next column is headed "percent of depreciation" and is obtained from the years old by multiplying the years of age in each case by 2½% corresponding to a life of 40 years which is assumed for the service pipe, giving the percentage of depreciation of 42.5% for the service pipe laid before 1903 and 7.5 for those laid during 1903 and so on down to those laid in 1906.

The "dollars depreciation" column comes next on the right hand made up by multiplying the total depreciation into the cost of service pipe for each year respectively; that is taking the service pipe for the series of years before 1903, treated as one entry, the per cent of depreciation is 42.5 and that is multiplied into the $24,976.00 representing the total of estimated cost giving
1131 the dollars depreciation of $10,614.00 on the service pipe existing before 1903.

That depreciation of $10,614.00 is deducted from the estimated cost of $24,976.00 for those same service pipes resulting in the value in the column headed "dollars value" of $14,362.00 on the first of January 1907.

In 1903 the estimated depreciation on service pipe is $444.00 which deducted from the cost of those pipes, namely, $5,928.00 leaves $5,484.00 as the value of said service pipes on the first day of January 1907.

A like method is followed as to the service pipes laid in each of the other years with result of total depreciation of $11,435.00 as the footing of that column and resulting in a value of $34,397.00.

The column headed "percent depreciation" has at the bottom the entry 24.9 representing the percent of depreciation by the total cost of service pipe, under the heading "percent total depreciation."

The average age of investment in service pipes on page 4 of exhibit "182" there is also entered in the column headed "years old" of service pipes the figure 9.9 which is obtained by dividing the

annual depreciation on service pipes into the total depreciation, and the annual depreciation is obtained by multiplying the new cost of said service pipes by 2½% corresponding to the estimated life of 40 years.

I should have called attention perhaps to exhibit "183" on page 6 of this same folder where the total depreciation and the annual depreciation is set out for these mains, services pipes, and meters. It is there collected and brought back there from these detailed computations that I have been going through.

Exhibit "183" is entitled "age and depreciation of Lincoln gas plant as of January 1, 1907".

The left hand column is made up of the same items of
1132 property, namely, buildings, works equipment, mains, meters and service pipes, that we found in exhibit "182" where the ages and percentages of depreciation are shown but in exhibit "183" there is shown against those same items of property the dollars of annual depreciation resulting in each case by multiplying the percentage of annual depreciation into the new cost of the property.

The next column "dollars total depreciation" being the difference found between the value and the cost of the property, computed in this way for different classes of property, as in this detailed explanation I have just gone through, for the different service pipes, meters and mains.

Exhibit "183" contains a column giving the date when the property was acquired or constructed and is headed "years built" that is on page 5.

There remains the topic of meters. In exhibit "182" the age of which and the total percentages of depreciation as to age was obtained by a similar process to that followed in the mains and service pipes. The meters being things of the same sort that were acquired during a long term of years, and require the same treatment to get the average age of the investment.

The detailed computation as to meters if found on page 23 of the valuation folder, it is exhibit "201."

Exhibit "201" is entitled cost and value as of January 1, 1907, of Lincoln gas meters owned before 1903, and meters since bought."

The exhibit as to meters consists of tabulations having the years at the left hand column corresponding to the dates when the meters were acquired; then the cost of the meters in the next column in dollars; then the years old of the meters acquired in the respective years as of January 1, 1907; then the depreciation in percentage on the meters acquired in the respective years; and finally on
1133 the right hand column the value on January 1, 1907 of those respective groups of meters acquired by the company in those respective years.

It appears from this tabulation that the total cost of the meters as of January 1, 1907 was $33,172.00 and the value was $22,470.00 and the difference being represented by the $10,702 of depreciation. Resulting in a percentage of depreciation for the entire group of meters of 32.2 a depreciation of 2½% annually corresponding to a life of 40 years being computed and allowed on the meters.

Following the table that I have described relative to the meters is a computation as to the fittings and connections of the meters, the depreciation on which is figured in at the same rate as the body of the meters, and the cost of the meters and connections is thereby raised to $41,944.00; the depreciation is raised to $13,506.00 and the value on the first day of January 1907 is raised to $28,438.00, on the meters and connections.

In arriving at the cost of the meters before 1903 that is arrived at on a uniform basis of allowing a certain price for a certain size regardless of when it was purchased. The cost of the meters before 1903 was estimated on the same basis as on the others, at so much per meter.

There is no*t* difference between the cost figures because it is an estimate of the cost as of January 1, 1907. In arriving at the age of the meters for the items marked "before 1903" in that case the meters acquired before 1903 are taken at 17 years old, the 17 years is made up of 4 years,—the space intervening between 1902 and 1906,—plus 13 the assumed average age of the meters on the first day of January 1903 that the company had previously acquired.

The style of meters had not changed a great deal from 1876 till 1907; practically the style is the same as when this company commenced business in 1873, there are minor changes. There have been many styles of meters introduced, there is what is know-
1134 as the prepayment meter which allows the passage of a certain quantity of gas if a certain coin is inserted but the main measuring part of the dry meter was invented a great many years ago and very few minor improvements have been made on the invention. The meters the company bought prior to 1876 are taken into consideration by me as having been purchased on that date 1876, if they have any meters older than that I haven't increased the age on that account. The gas company were using the same kind for a long time prior to 1876 that they were using in 1876. Meters purchased 3 or 4 years previous to the year used in computation of mains are the same age, I might have run those back, but this is an approximate computation and I haven't tried to get the age exactly, of course, they had already discarded those pump logs they were using as mains, but that don't affect the meters. The life of the meter is easily 40 years and I just carried all at 13 years average on the meters the same as I used on the mains, it would be a little greater than that but there were only a few meters in use in that early day and it wouldn't greatly affect the result, it would raise it perhaps a coupe*l* of years. Exhibit "201" was being explained for the purpose of showing just how the entries made in exhibit "182" on page 4 of the folder were obtained. The total of $28,438.00 shown on exhibit "201" isn't carried into exhibit "182", that wouldn't go to the total cost and value for some time. That is carried into another exhibit. I want to get through showing how the property should be depreciated before taking up the cost.

The next exhibit in order would be exhibit "183". I think I have already described exhibit "183" as consisting of a list of the same items of gas property as that given in exhibit "182" and having

annexed to the respective items of property the respective dollars of annual depreciation computed on the basis of the lives assumed in exhibit "182" and the dollars total depreciation computed on
1135 the basis of those lives and on the ages expressed in exhibit "182".

In order to obtain the amount of annual and total depreciation shown in exhibit "183" it is necessary to show the *the* remaining cost of the property and respective items, but I would like to make whatever explanation is necessary to exhibit "183" now without explaining anything about the costs, anything more than to say they were necessarily used to use the application of percentage obtained in exhibit "182".

Now the first group of property items in exhibit "183" is that of the buildings on which the annual depreciation is shown to be $370.74, set out in detail for each building. And the total depreciation is shown to be $5,585.00.

For nearly all of the items of property in exhibit "183" the year "when built" is stated, that is not true of some of the items, but I think only those whose construction ranged through a period of years.

Taking works equipment the depreciation in "dollars annually" is set out against each item and the total depreciation and the footing of the works equipment is for the annual depreciation $1,934.06, to which there should be added,—although the computation isn't carried in this exhibit "183",—the depreciation of $71.20 on office furniture.

The total depreciation on the items of works equipment is $20,293.00 to which agains should be added the item of office furniture $1,424.00 which appears there but the footing wasn't made. Adding in office furniture to works equipment gives a total annual depreciation on works equipment of $2,005.26 and a total depreciation as of January 1, 1907 of $21,717.00.

On the distribution system which has been taken as including cast iron mains, steel mains, service pipes, meters, paving over cast iron mains, paving over steel mains, and paving over service pipes, the "dollars annual depreciation" is $4,131.58 and the total de-
1136 preciation is $50,245.00 on the distribution system.

As to the matter of cents in any considerable total I always drop them off; I have left them on here where I have a large number of items on the said annual depreciation the cents become an appreciable holding sometimes in the percentage of the total so they are left in the annual and dropped off in the total.

Whether this company had the same kind of service pipes prior to 1876 as subsequent,—well the history of service pipes is about this: in the very early days back as far as 1876 most of the service pipes, possibly all, were genuine wrought iron. In those days service pipes were made very small, ½ to ¾ inch was the ordinary house service and the use of those small service pipes ran along certainly past 1890 to a very large extent, with that exception I should say service pipes were of the same general character in the early years. The tendency in later years has been to put larger pipes in, the

extra cost of the pipes themselves is small but the convenience and lasting qualities are better.

Concerning the class of service pipes used between 1872 and 1876, speaking from a general knowledge of the pipes, I think I have described that, they were probably small ½ to ¾ inch wrought iron pipe.

In computing the ages of service pipes I applied the same method as in computing the meters. I made a somewhat favorable assumption for the company. I have taken the average age of 13 years when it is probably 2 or 3 years more than that. It may be inferred from my testimony that service pipes are still wrought iron, that is not the case. It is common to lay black pipe which is soft steel approaching wrought iron in looks, the mechanical qualities are not the same. There is quite a difference in it when seen under the microscope, the structural qualities seem to differ and by some seem to differ in lasting qualities too. The wrought iron
1137 is somewhat more expensive. In some cases steel is used for service pipes but the black merchants pipe is more commonly used. Exhibit "184" on page 7 of the valuation folder, headed "Cost and value of Lincoln gas plant as of January 1, 1907" and is in the form of a tabulation consisting of three columns, the left hand column contains the entry of the plant items already enumerated in exhibits "182" and "183", the same items are repeated in exhibit "184" with the addition of the item of "land" which has not previously been dealt with, not being treated as subject to depreciation. The left hand column contains the names of the items of property; the next column the "dollars cost" as of January 1, 1907, meaning thereby the cost at which the objects of property cost, on property or equipment classified there efficiently for the purpose in hand ought to be procurred and erected complete in position as found in the right hand column headed "dollars value" which contains the value of each item of property as of January 1, 1907. The first item dealt with in this exhibit is "land", certain land owned by the company and occupied in part as residence property has not been included in this valuation, for the reason that in the first place it is not used at all as far as I could observe, for gas purposes, and second as far as its situation is concerned it is such it does not appear it would ever be used or is really suitable for use for gas purposes; I don't think it would be good policy to use it for any extension of the works, it might be used for storage yards, but even that is in the future, as the company has stored its materials on another cite. I do not think it should be enumerated in the property on which the consumer at the present time should pay returns so that is another reason.

That leave- lots 1 to 12 inclusive of block 79 of the original plat of the City of Lincoln which I find to be in the form of a square as shown on exhibit "221". At appears that these lots con-
1138 sist — the entire block 79, also as I understand, the alley between the lots,—that being necessary to make out the dimensions of 300 by 300 feet amounting to 90,000 square feet. Block 79 is occupied in a considerable part by the gas works, also by

the electrical works. I have not made any separation of the portion of the land that is used for gas purposes from that used for electrical purposes. I understand the generating plant of the company to be located on that block, I know the electrical plant is there because I have been through it. This block 79 has a railroad track running through it parallel to Second Street and crossing M Street and extends a considerable distance into block 76. I find a good deal of gas material and *sutff* located now on block 76 into which block this railroad runs, but not being advised that the company owns block 79 or pays any rent for what it occupies I have not dealt with it any farther than to note that the company has by its actual operation extended its plant and property on to block 76, that being directly in line with block 79 that is the convenient way to extend the plant so you can keep your track straight and have only to go straight across one street in order to traverse the distance from block 79 to block 76. Now block 79 being 300 feet on a side contains 90,000 square feet. I have had a search of the register of deeds' records made and have a substantial number of sales of vacant lands that have been made in the vicinity of block 79 during recent years, for the purpose of getting an idea of what land in that vicinity is worth for any purpose in the market. I intend to prepare an exhibit of these sales of land in which every detail will be specifically set out, I haven't that prepared but it will go into one of the folders as an additional exhibit if proper to go in.

I will now have to describe the sales I have referred to,
1139 as throwing some light to my mind on the value of your land.

O Street, one of the principal streets in the City of Lincoln, crosses the railroad tracks by a viaduct and runs past blocks 48, 47, and 46,—block 48 being the one nearer the railroad tracks and viaduct so those lots front on O Street. I notice an electric car track running along O Street, my recollection is I have seen electric cars passing along that track. Now to the gas property you traverse two blocks along there,—there are two or three streets from O before you come to block 79 which is occupied by the gas plant. These sales which I have obtained record show a substantial consideration and one which I have assumed to be the actual consideration, because they are located in the half of the blocks 46, 47, and 48 which front on O Street, which are two block- away from block 79 occupied by the gas works. I have found in block 47 four lots fronting on O numbers 3, 4, 5, and 6 having a total area of 14,200 square feet, which were sold and conveyed by warranty deed in 1908 for $400.00 for the bunch, that amounts to .0281 cents per square foot for the land in these lots fronting on O Street.

In block 47 again lots 8 and 9 containing 7,100 square feet were sold and conveyed by referee's deed in November 1910 for a total of $140.00,—each lot being sold for $70.00 the consideration expressed in the deeds is .0197 cents per square foot.

In block 28 fronting on O Street lots 7, 8, 9 and 10 containing 14,200 square feet were conveyed for $700.00, which amounts to .0476 cents per square foot, those lots front on O Street next to the

railroad and viaduct, that is the block is next to the viaduct, the lots themselves are not next to the railroad and viaduct, that sale occurred on August 7, 1912.

In block 46, which is a block fronting on O Street bounded on one side by Second Street, lot 10 fronting on O street con-
1140 taining 3,550 square feet was sold for $30.00 July 1, 1910, that amounts to .0084 cents per square foot.

Another sale in block 46 was of lots 1 and 2 sold and conveyed by referee's deed for $56.00 July 2, 1910, containing 7,100 square feet amounting to .0157 cents per square foot.

Those are all the sales I have been able to get in this vicinity, they are all lots fronting on O Street, substantially 2 blocks from the gas works being to my mind a location that would make them more valuable. The value of land for gas purposes is something that is more or less alone I suppose all over the country.

I have a record here of sales in block 77 that being the block in which the company owns some residence property, lots 4, 6, 9 and 10 in block 77 were conveyed by tax sale and deed on January 24, 1906, four lots were included in this sale, one of them adjoins one of the lots owned by the Gas Company and is occupied for residential purposes, another lot adjoins the aforesaid lots and the other two lots sold under tax deed are in the other half of block 77.

While I don't have any general expert knowledge of the values of land in the City of Lincoln I think I am entitled therefore as result of this investigation some opinion as to the value of lands in the immediate vicinity of the gas works. I have acquired some knowledge of the value of such land the country over by various investigations of this kind that I have made and that is some help at arriving at a fair conclusion, as to the value of land in block 79.

I have put the value on the 90,000 square feet of land in block 79 at 2½ cents per square foot which brings the value to $2,250.00 that value happens to be written here in the column of cost prices,—it should be in the column of value but means the same thing. That is how the item of $2,250.00 for the land was arrived at. I might say that 2½ cents per square foot taking cities somewhere near this size is a figure that is more than has been paid in very recent years
1141 for a great deal of land occupied by gas plants. Of course you will find great variations on market values of land alone occupied by gas plants and land built up a good many years ago and about which business sections have come to have high values,—not for gas purposes,—but for some business purpose after the works were destroyed and moved away; by taking the land bought in recent years for gas plant purposes 2½ cents per square foot is enough, it is rather a high price. It is not uncommon at all to find such land bought at $1.00 per acre or leased so that in the light of the records of these sales my conclusion of the value is 2½ cents per square foot, and I find that conclusion to be not *all* all out of accord, except that it is a little high as the prices indicate, of land occupied by gas companies in other cities where such land has been acquired for gas purposes. Lots of land, if the gas works were taken away might be sold

for $1.00 per foot but that doesn't affect the value of the land for gas purposes.

Since I was on the stand yesterday I have learned of a difference in quantity of land owned by the company than that shown in my report. It has been called to my attention that M Street a 100 foot street on one side of block 79, the block owned and occupied by the gas company, has been vacated; and my information further is that would result in a reversion to block 79 of one half of the width of M Street for the length of the block. M Street is shown on this plan to be 100 feet wide and the length of the block being 300 feet one half of the width of the street for that 300 feet would add 15,000 square feet to the land owned by the Gas Company adjoining block 79. I shouldn't think this additional amount of land was *accessive* for the present or prospective use of the company,
it is not absolutely necessary now, it isn't so much in amount
1142 yet it should be included. I don't think it should be excluded
from the property to be considered, on account of its amount. I think it only fair to give the value of all that land and that ½ cent per foot ought to be added to the figure I gave yesterday, that is $375.00.

I would like to say a very few words in reference to my valuation of this property as a plant in operation to this the possibility that I didn't fully cover it in what I said yesterday. I intend to make it perfectly plain that I have valued this Lincoln gas plant as a going, operating plant,—going in the sense that it is operating and is to be operated and used as well as being used for the purpose of making gas.

Now the word "going" as I understand it is used in several sences in connection with public service properties and business. When I say I have valued the Lincoln Gas plant as a "going" plant I mean simply as an operating plant and suitable to be operated and intended to be operated, there is a "going value" that attaches to a public service business. As I said yesterday I have not computed that value for the reason primarily that I don't think the "going value" of a public service business is an element to be considered in a rate case, but I want to forestall particularly any inference from my testimony that I value any of the physical properties of the company as junk, or as material to be removed or sold, or anything of that sort. I have valued it all as equipment used and useful to be used in the gas business.

Answering whether I have left out of consideration the established relation between the company and its consumers,—insofar as the intangible end of the business is concerned, I have valued the service pipes of the company which constitutes a physical link, but I have left off,—as I understand the decision of the Supreme Court of New York in the Consolidated gas case has ruled out these elements in
those very words described so I thought it should not be
1143 included here. I might say that a witness in this Con-
solidated Gas case described good will of the Consolidated Gas Company to constitute primarily of the business relation and connections that had been established between the company and

its consumers and for having service pipes running into the premises of the consumer and defining that all under the name of "good will", one witness valued that at $7,500,000 and another one about $18,000,000.00 and when the court excluded the good will I suppose it must have excluded those elements which the company by its pleadings and testimony of the two witnesses had defined as good will.

As I remember, I had just finished last night with the land, Exhibit "184" on page 7, the next items to be considered are the buildings and works equipment; and perhaps it will be proper to say here that in valuing this property I have relied more or less on the various specific contracts and prices that I know of at which gas property has been bought and sold in specific places and at specific times. I have quite a number of such contracts with me, and notes giving the main points in a number more. Every one of these contracts are available for the use of the court, there is nothing private about them in any way and any contract or sale price I mention or have used in connection with any of this equipment, if I haven't got it here, anything that is under my control will be produced here at a later date if there is an opportunity to exhibit it.

In Exhibit "184" I call attention to the items headed buildings which includes the purifying house, retort house, coal sheds, oil tank house, blacksmith shop and stable. In looking over the testimony already in the case for the buildings which I have now mentioned I concluded to offer no testimony as to the value or cost of certain parts of the buildings, but to assume simply for the purpose of this computation that costs put on certain parts of the
1144 buildings by witnesses of the company. I made a mistake just now in saying that I did not deal with the value of those buildings, I have, but I arrived at such a value I have stated for those certain parts of the buildings, by dealing with the cost assigned for those parts by the witnesses for the company. The method of dealing with the buildings is shown on pages 9 and 10 of this Exhibit "185," and the purifying house will illustrate the method as any, and I will now call attention to that on page 9 at the top. Exhibit "185" is headed "detailed cost of buildings as of January 1, 1907" and contains an itemized schedule showing the way the cost of the buildings here set down has been arrived at. In these computation- I have assumed that the quantities of material set out by the company's witness for the buildings here the quantities there, I have not undertaken to change the quantities, in making that assumption I neither affirm or deny the correctness of those quantities: I have dealt with the matter as though they already existed there, I don't know and don't claim that they do or do not. Have taken the quantities as set out by the company's witnesses as existing in these buildings I have, with regard to excavation, the stone and concrete foundations, and the bricks applied a price to those quantities which I consider fair and reasonable for their construction as of January 1, 1907. The other costs of the buildings I have left as the company has set out in this testimony, and have changed in every case, the total cost of the buildings to correspond with the prices that I have adopted for excavating, and removal of the soil where the

buildings were erected based on the entire quantity of excavation that the company has set out; and for the stone and concrete foundation the company says exists there, based on the uniform price of $7.00 per yard for those stone and concrete foundations; and the price which I have adopted for the excavation and removal and grading of the soil is 40 cents per cubic yard; and the price I have used for the brick work in place is the uniform price of $15.00 per
1145 1,000 brick in position.

Now with that explanation we may take the purifyinghouse at the top of page 9 there is the excavation and removal,—I have added the word removal to make it plain that I am dealing with the same work and terms that the company has set out,—ordinarily I should call it excavation, that being the common nomenclature.

The excavation and removal of soil necessary to put in the foundation of the purifying house amounting to, I take it, at 4,536 cubic yards,—it is set down here apparently being a misplacing of the decimal point at 453. cubic yards but that would not multiply correctly into the cost and no doubt is a mistake of the typewriter. The excavation of 4,536 cubic yards at 40 cents per cubic yard in the cost of the purifying house amounts to $1,814.40.

The stone foundation is taken at 505.9 cubic yards as applied by the company, and to that I have applied my price of $7.00 per cubic yard for that class of foundation amounting to $3,541.30.

The total brick reported as put in that building is 198,155 at $15.00 per thousand amounts to $2,975.33.

Those are all the quantities in that building on which I have fixed a price, I have left all the other quantities and prices as the company has fixed them, I have assumed them to be so. The total of the above excavation, foundation stone and brick work as I have just set it out is $8,328.03.

The total cost of construction for the purifying house given by Mr. Lea on behalf of the company was $16,620.00 and from that there is deducted $12,317.00 which Mr. Lea allowed for the items of excavation, stone and brick work that I have dealt with. Leaving for the remaining portion of the building entire according to Mr. Lea $4,249.00 to that I add my above cost of excavation, stone and brick work amounting to $8,328.03 which brings the total cost of the purifying house to $12,577.03.

Now that is the method on which each one of these buildings has been dealt with, except the stable and blacksmith shop which is taken in toto not being a building in which masonery enters it is only wood and that is taken at the figures the company put
1146 on it. Throughout the computation as to buildings I have used the unit figures of 40 cents per cubic yard for excavation, $7.00 per cubic yard for stone and concrete work; and $15.00 per thousand for brick or tile on the basis of brick measure, all these unit prices are for the material as it exists down there.

Now with regard to these unit prices, taking the 40 cents per cubic yard, this may be said,—I think fairly that the excavation down at the company's cite when those mains buildings were construction in 1890 to 1892 the elevation of that gas yard was several feet lower

than it is there today undoubtedly; it was unnecessary at that time undoubtedly to make any quantity of excavation such as would be indicated now. I should think for a rough estimate, not having taken any levels, that the level had been raised surely as much as 4 feet, it isn't uniform and may be more or less, that is made an *an* approximate and I believe a fair estimate.

In that yard, besides excavations for the building there was in 1907, those gas holder- which are of the old type of construction or what we call a masonery tank, that is a deep hole is dug into the ground of a sufficient depth so that the moving part of the lift changes its position as to the amount of gas in storage and can drop down into the ground and pretty nearly disappear with just a little of the top stuck up, that means the removal from those parts of a very considerable amount of material. The pits, as can readily be seen by inspecting the site there, were not dug deep enough so that the required depth for the entire dropping in of the lift was entirely below the natural surface at that time. That didn't happen at all, what they did was to construct the holder pits partly in what we call excavation and partly in what we call embankment. In other words they dug the dirt out of the hole and piled it up around the edge of the hole, that is what they did when they dug for the
1147 200,000 cubic foot holder and the 50,000 cubic foot holder, briefly from an inspection of the property. Having piled the dirt up around the edge of the holes, these pits being large circular holes the inside was lined with masonery or a tank, the earth being in front of it it was necessary to pile it immediately about the mouth of the hole to bring the level of the soil to the top of the tank, it was then graded off for a few feet perhaps 100 feet in some instances although I would say 25 feet would have covered it,—anywhere from nothing to 100 feet,—the dirt was moved and graded off and that was what became of it. It was taken out of these holder pits and for the foundations of those buildings, if 4 feet was added to the natural elevation of the soil down at the gas site, it decreased just that much the apparent necessity for excavating, if you go down now and see how high the soil is about the footings of the buildings. I was down a few days ago and saw a man digging down to one of the footings. I understood Mr. Foster sent him. In doing that today you will get a substantially deeper excavation, one approximately 3 or 4 feet deeper for your excavation, than was ever made when the buildings were erected because the soil never having existed there it wouldn't be necessary to remove it today. And 40 cents is an ample allowance in fact possibly more than necessary but I intended to make the figure ample and sufficient. I would like to say in connection with what I have just said about the excavation and the level of the ground at the gas works I have tried to confine myself purely to expert testimony, I don't know of any other way to arrive at the facts I have been stating.

Referee: That particular part I think is entirely competent, you went over that ground and you saw it and you drew your deductions from what you saw, there is no doubt of any objection to that part.

1148 (Witness continues:) They are in a sense argumentative but they are at the same time engineering conclusions, all engineering conclusions are supposed to include some reasoning on which they derive the facts and show their conclusions properly by the use of good reasoning.

Proceeding then with the explanation of exhibit "185" having stated that I consider 40 cents per cubic yard of material removed an ample allowance to cover all the labor and the removal and disposal of the surplus material, or as ordinarily we would say the grading of the surplus soil into a suitable position after its excavation and all work done on that soil; in other words so many yards having been taken out of its natural position the 40 cents covers everything that was done to that number of yards of earth and the labor on it ap-rt from the taking of it out from its original position was very slight in my opinion because it was needed for filling very close to the point where it was taken out of its natural position and the labor of grading was very small.

In that connection I want to call attention to 1 or 2 facts that have aided my judgment in reaching that conclusion. Of course, I heard the testimony here yesterday of a man who claimed to have made a satisfactory compensation to himself by digging a hole 10 feet into the ground at 35 cents a yard, tends to confirm my estimate that 40 cents for digging holes that may have been 2, 3, 4, 5, 6, or 7 feet deep for those various buildings down there, it certainly confirms my position that 40 cents per cubic yard is a very compensatory rate. I have some facts quite apart from that which tend to corroborate the 40 cent rate. I will mention as one of them the contract which the City of Lincoln made last year for the construction of a 1,500,000 gallon reservoir adjoining the pumping station; the proposal which preceeded the making of that contract and on which it is based is exhibit "219" found on page 12 of the

1149 folder entitled "data considered" I called particular attention to the part of this proposal that deals with the excavation which occupies only one sheet and I have copied the entire proposal here.

In that proposal the rate fixed for 8,620 cubic yards of excavation is 30 cents per cubic yards as appears in the schedule of prices annexed to the quantity of materials to be furnished and removed. That 30 cents included the excavation and backfilling, and all work in connection with all that excavated soil and material. The contract was made at the figure of $13,361.00 for excavation of 8,620 cubic yards and the grading of it and the disposal of the material was all done at the rate of 30 cents per cubic yard for excavating.

Now I want to refer to the character of the excavating for that 1,500,000 gallon reservoir. The reservoir is a covered one, its general shape is that of a rectangular concrete box in the ground, the top is now covered with earth perhaps 4 or possibly as much as 5 feet above the original natural surface of the ground, the top is cover-d the earth which is undoubtedly a part of this original excavated material with dirt sides gradually sloping down to the natural

surface. In other words this reservoir was undoubtedly constructed just as the gas hole pit down at the works particularly in respect to the embankment. I have the city engineer's drawing showing the construction of that reservoir and the distance shown here between the floor on the under side between the reservoir and the roof is 16 feet and 9 inches so that I judge that the excavation of the natural soil for that reservoir, must have run up to 9 or 10 feet anyway; and that excavation, grading and disposal of the soil in final shape was all done at the rate of 30 cents per cubic yard of the original material in the yard. Whether there was a further provision in
that contract for the possibility of an excess in the excavation
1150 or a shortage,—Oh yes, this price I mention required the
contractor to state his unit price and there is a provision in the several specifications which applies and run at whatever amount they are and any change in the work is to be compensated for accordingly, that is if the city changes the contract the contractor is to receive 30 cents per cubic yard for addition amounts. The work was done by Abel & Roberts. I want to carry this reservoir matter of excavation somewhat further because during the present year on 17th Street the city has let another contract for a reservoir of 500,000 gallons capacity or ⅓rd the capacity of the one constructed last year. That reservoir is under construction, it appeared to be just ready for placing the concrete. The contract for that 500,000 gallon reservoir was also let to Abel & Roberts the contractor who had this contract last year for 30 cents a cubic yard.

Now that excavation on 17th Street is called the Van Dorn Street reservoir. The hole for that reservoir as stated by looking at it is about 12 feet deep at one end and some 8 feet deep at the other, the ground varies a little in the general elevation. I have a drawing of the reservoir. It is a rectangular excavation I should think fully 12 feet deep at one end and fully 8 feet deep at the other end and the removal of the earth from an excavation of that kind, from the lower levels of it is distinctly more expensive than the removal only of 5 to 8 feet, of course, the deeper you go the greater the lift and the greater cost of removing it that was brought out by the testimony here.

That fact, to my mind, having two city reservoirs here, one constructed last year and one this year, having a character of excavation, as I think, on the average decidedly mor- expensive than the excavation down at the gas works for the footings of these buildings
and that the same contractor took the job last year who took
1151 it this year and at the same price, all these facts tent to con-
firm the 40 cents per cubic yard price; which is 33⅓% more than the city has paid for those two is a further reason that 40 cents per cubic yard is an ample allowance for the excavation on those gas works buildings. I am not talking about the excavation in the gas holder pits. There is in both of these contracts separate provisions for the removal of any excess soil. I have stated that the 30 cents a yard for the removal of the yards goes in to make up the total price for — the work was let.

As regards what proportion the excavation in these two contracts

to the total amount of work done in value,—in the 1,500,000 gallon reservoir the excavation was 8,620 cubic yards as set out in exhibit "219" and at 30 cents a cubic yard amou-ted to $2,586.00; the total contract price for that work, which included concrete and rei*m*forcing steel and some minor articles amounted to $13,361.00. The concrete is figured at $10.00 a yard. I don't think I loaded the concrete a little, if you were to look at the drawing and inform yourself what kind of concrete it is and see the shape of it. Concrete is a thin*k* whose cost varies a great deal with the form into which you put it. If you have something which you must build up entirely with forms as in these reservoirs, costs a good deal more per yard than if you dump it in a little hole for a building with possibly only a little board along the side. I would like to call attention to the character of the reservoir contracts on that concrete figure.

Exhibit "223" is a plan and sectional elevation for the rei*m*forced concrete reservoir for the 1,500,000 gallon reservoir covered by the contract and proposal just mentioned, said proposal being exhibit "219." The general form of this reservoir is rectangular its total length about 193 feet and total width 74 feet,—I don't catch the over all depth,—but the distance from the roof to the floor
1152 which is sufficient is 16 feet 9 inches; the reservoir is of the covered type, has a floor, sides and roof of concrete being completely covered and is in the shape of a great big dry goods box in the ground. The floor and roof, except in the rei*m*forced portions are only 6 inches thick. The floor particularly you will understand is a flat piece that has to support a great weight, there being a depth of about 16 feet of water which the floor most support and the floor is only 6 inches. The guaranty against leakage in the contract for this reservoir is set out in the contract and is a distinct guaranty for a period of time against leakage of this reservoir, the point that I am coming to in the matter of concrete that sectional end fully is quite good as illustrating its character (indicating) these are post- that support the roof, we have a roof there and a floor that is only 6 inches thick and the sides vary from 12 inches at the bottom to 6 inches at the top. In order to get the soft concrete into that permanent form you have a good deal of form work to do; you must buil*t* forms for substantiall- all of that concrete work, because on account of its thinness and form but that adds greatly a*f* far as the putting it in. The concrete figure here for that 970 yards of concrete is $850.00 per yard, which is an entirely different class of work from putting in a footing for a building for which I have allowed $7.00 per yard. Concrete will vary anywhere from $3.00 to $4.00 per yard up to $25.00 or more according to character and location of the concrete. There is a great variation in the cost of concrete work according to the thickness of the masonery you try to form, its location and shape, and also according to the amount of cement you are required to use in the concrete and rigid-y of the specifications as to the matter of mixing and placing of concrete. If there is a lax*a*ty even in that cement mixture which changes the

cost, if it requires it must be mixed thoroughly with sand and
1153 stone that adds something to the cost.

This concrete at $8.50 per yard amounts to $8,245.00 out of $13,361. In regard to this class of work $8.50 a yard is much cheaper than $7.00 a yard for the class of work at the gas works in connection with those buildings.

Another item than need- explanation in connection with this reservoir is, that is the 85,500 pounds of reinforced steel. The floor, sides and roof of this reservoir,—the other one now being constructed is on all fours with this one, only somewhat smaller;—. Concrete won't stand the pressure of water at all without steel reinforcing so this contract calls for 85,500 pounds of steel to be laid in these concrete walls as constructed to give addition- strength, by putting that material in those walls it adds to the cost of your concrete decidedly. The $8.50 is the price for putting in the concrete the steel is extra, which is bid for at so much a pound, at .026 cents per pound. This steel consists of a variety of bars and shapes, there is some 20 inch beams among it, and a good deal of small twisted bar material which is cheaper in price than the fabricated material, that is steel material riveted together, as for instance for building the roof and floor, and this price is .026 cents per pound, that steel amounts to $2,223.00 out of your $13,361.00. There are some other very minor quantities in this reservoir contract amounting to a little over $300.00 but the three large quantities which make up almost the entire contract are the 8,620 yards of excavation at 30 cents amounting to $2,586.00; the 970 cubic yards of concrete at $8.50 per cubic yards amounting to $8,245.00; and the 85,500 pounds of reinforced steel, at .026 cents per pound amounting to $2,223.00.

I was dealing in exhibit "185" with the unit cost of 40 cents per cubic yard for excavation at the gas works, and have endeavored to explain my reason for thinking that a sufficient figure, and
1154 also gone into the matter of concrete some and as appears on exhibit "185" I have placed that concrete at $7.00 a yard for the concrete in position. In these buildings I have used the same figure for the rubble masonry which forms a part of the cost because $7.00 concrete would be fully as good as that masonry and $7.00 would be sufficient for the masonry itself,—today we would hardly put in rubble stone we would put in concrete instead,—and $7.00 per yard is very ample considering the class of work where you don't have to put in any reinforcing steel and only a small fraction of timber work must be used in the shape of forms, as compared with the reservoir contract with a large flat roof to support with side and floors as described.

In the matter of brick at $15.00 per thousand, for the character of brick work found down there, where the joints will vary all the way from ⅜ to ⅞ of an inch and where the bricks are of a very moderate quality,—the bricks themselves being worth $7.00 per 1,000 on the cars at the works as shown by many of the bills of the company,—$15.00 for those in position is an ample figure taking into account the fact that a small percentage of the brick required but a little more labor to place them than the great bulk of the brick

did and taking the bricks as they run through the plants, considering the character of the masonry work, being a very moderate class of brick work,—not meaning to throw any mud on the buildings, but they are intended for a rough building down there at the gas plant and are a very moderate character of brick work. Using wide joints and joints varying a great deal in brick work tends to decrease the labor cost. You can lay brick faster if you are not held up to any specifications as to joints, if you throw the mortar right in and let the brick go where they want to.

1155 That disposes of the three unit prices that I have used in making up the cost of these buildings. I have left all the other materials except the brick, stone, concrete and excavation, just where the company's testimony leaves them and have simply added them in to see what the amount will be for each building, taking the company's figures for everything except the items I have described.

Dealing with the matter in that way gives on exhibit "185" for the purifying house a cost of $12,577; retort house $6,088.00; coal shed $1,657.00; oil tank house $1,107.00.

The stable and blacksmith shop I have simply carried into the total for the figures, dealing with the matter in a uniform method and as dealt with by Mr. Lea figures, as not having any masonry connected with it; and the figures show that item $818.00.

That gives for the plant a total cost of construction $22,247.00 and the plants being depreciated in the way I have indicated in my testimony yesterday brings their value as appears in exhibit "184" to $16,662.00 as of January 1, 1907.

Those are the figures carried forward into the summary shown in exhibit "180" for the items covered by the words buildings in that summary, and perhaps it would be well to explain fully here in connection with exhibit "180" that I have followed the practice of adding my allowances for engineering, interest, taxes, etc. at the bottom of the footings in exhibit "180", that is on the first page of the valuation exhibit, and I have included in those footings the land in the sum on which engineering, interest etc. if fixed; I know of no good reason for excluding the land. If you are going to build a plant it requires a suitable piece of land and some money to have it surveyed and on that sort of thing and you lose some interest on it while the plant is being constructed; it is just as reasonable to include it among the items to which there is an engineering and interest charge as any other item. I notice the company have not so included

1156 it and it makes their engineering charge a little less, but it is included here.

Turning now to Exhibit "184" the next items are those included under the general heading of "works equipment".

In 1907, the date of this valuation, the first item to come under that heading as set up here is the 6′ 6″ water gas set furnished by the Western Gas & Construction Company. That set is considered here in arriving at its value in connection with the old Springer set, which is also of the same nominal size although of decidedly less capacity and inferior design. That Springer set appears from the records to have been procured in 1888, while the 6′ 6″ set was pro-

curred in 1891 from the Western Gas & Construction Company. Those two sets together have a capacity approximating to that of one 7′ 6″ water gas set of modern construction and to my mind a person who had the right to operate that plant and was free to buy and pay for two 6′ 6″ sets or to get him one new set could not look at them in any more favorable light than to say to himself here are two old water gas sets whose combined capacity is about equal to that of a 7′ 6″ set which I can buy for so much money. Waiving all the disadvantages attached to this ancient apparatus, the largest cost I can allow for those two sets is the new cost of a single 7′ 6″ set. I don't believe any sane man who was free to buy those for his own use or to buy any one set would give any more than the cost of a new set of equal capacity; I have valued the set on that basis. That is I have valued the set by considering what their new cost should be in view of the new cost of a single modern set with a capacity equal to their combined capacity; and I have divided that new cost between the Western Gas and Construction Company set and the Springer set in
the proportion of $\frac{3}{4}$ to the Western Gas & Construction set
1157 and $\frac{1}{4}$ to the old Springer set.

The reason for so dividing them is because that approximates their relative capacities. There has been such an improvement in the cost of water gas apparatus between 1888 and now,—that was pretty near the beginning of water gas apparatus in this country,—before 1901 we often spoke of 6′ 6″ or 7′ 6″ or 11′ according to the diameter of the generator of those sets while nominally of the same size 6′ 6″, there has been such a change in the art by improvements that I notice the company in its testimony puts in the Western Gas & Construction Company set as having about double the capacity that of the Springer set; and while the capacity of the Springer set is problematical I am willing to adopt the company's statement of the relative capacities. Concerning the economy of operation of running those two sets as concerned with running a 7′ 6″ set of the same capacity,—it would be distinctly less. No well advised company would think of running that old Springer set continuously when the cost of the material would be an appreciable item, but if you have to have some gas right quick you don't care much whether you are going to make 200,000 feet whether you run it at a cost of 10 cents a thousand feet or not, whereas if you were going to run it the year around you couldn't afford to run it at that price, you would have to raise the price of gas. It makes all the difference in the world whether you are going to use it a few hours in the course of a year or whether it was for the regular daily out-put of gas.

Going more into detail as to the estimated cost of those two 6′ 6″ sets I want to refer to the cost of the 7′ 6″ water gas set that the company purchased last year. The contract price for that set was $8,000.00, which included 635 square feet of cast iron operating floor
on steel piers and a pyrometer. Such operating floors are
1158 commonly installed by the party who furnishes the water gas sets; they are a special type of floor necessary and desirable. And can readily be gotten up at the factory where the sets are made, and are commonly furnished either under one sum covering the set

and floor as was the case here, or else at the usual price of $1.25 per square foot in gross area.

In designing to get at the price of the 7′ 6″ set purchased last year by the company, I have taken $8,000.00 which the contract or bills show they paid for that and deducted the cost of the 635 square feet of operating floor at $1.25 per square foot which leaves for the set erected in position,—it being in the contract to erect the set complete in position on a foundation provided by the company,—that leaves $7,206.00. That price compares well enough with various other price- I have of water gas sets in other places therefore I see no reason why it is not a very good basis for the valuation here. We have on the basis of that contract the cost of that set erected in position as $7,206.00, however, I have estimated the cost of the set at $7,300.00 for a set of that kind, a little more than this set actually cost them. I mentioned that amount of that estimate $7,300.00 now for the set, not because the machine was there on January 1, 1907, but because I wanted to show just how I proceeded to get at the cost of the two 6′ 6″ machines on that date. The company had to supply the foundation for the 7′ 6″ set that was bought for $8,000.00, and I estimated the cost of that foundation on the basis of quantities that were involved in it that the company says were required namely, the quantit-es of excavation and concrete foundation. I have assumed the figures of the company to be cocrect. That assumption is not an affirmation of the figures, I simply take them for what they are worth, they are the figures supplied by the company. Figuring the cost of the foundation on the basis of the quantities furnished by the company and on the basis of 40 cents per yard for excavation and $7.00 per yard for the concrete makes the foundation for that
1159 7′ 6″ set cost $206.00,—that is based on the company's quantities and my figures for the unit of the quantities in position on the foundation. The total cost I estimated of a 7′ 6″ set and foundation erected is $7,506.00. That is without the floor, I deducted the floor. I have all the company actually paid and a few dollars besides, at the company's quantities for foundation at my unit prices it was somewhat lower than theirs. The foundation is a relatively small figure in that anyway.

Taking that 7′ 6″ set at a cost of $7,506.00 I allowed for the cost of the 6′ 6″ set and the one furnished by the Western Gas & Construction Company in 1901, ⅔ of the $7,506.00 amounting to $5,-808.00,—found in the column of cost in exhibit "184". It should be understood in connection with this estimate that I am tracing through the steps of a process by which I arrive at the value of a thing that sets down on the gas company's property if it were new and then to see what depreciation has gone out of it because of age and use. I have take- the 7′ 6″ set at $8,000.00 the contract price, I understand that was for the set erected in position. No that does not include scrubbers and condensers, they were bought in 1908. In the 6′ 6″ set they have a scrubber and condenser with them. Whether I omitted it the item of scrubber and condenser amounting to some $1,200.00 in comparing it with the 6′ 6″ set, and whether my $7,506.00 is ⅔ of that or $5,808.00,—no, $5,808.00

is not the ⅔ of the other quantity. The condenser and scrubber in connection with the 7′ 6″ set at the estimated cost of $1,206.00 isn't included in the $8,000.00. The condenser and scrubber forming a part of the 6′ 6″ set it is necessary to add to the cost of a 7′ 6″ set the cost of the scrubber and condenser for such a set, as the total cost of the 7′ 6″ set is being taken as the measure of the cost of the 6′ 6″ set, and the figure of $5,808.00 for the 7′ 6″ set purchased in 1901 includes ⅔ of the $7,506.00 that the bare 7′ 6″ set would cost and also an allowance for the condenser and
1160 scrubber in addition. The condenser and scrubber for the 7′ 6″ set, estimating cost of that foundation of $1,206.00,—and ⅔ of the $1,206 or $804.00,—is added to ⅔ of the $7,506.00, the cost of the bare 7′ 6″ set so as to get the measure of the cost of the 6′ 6″ set with condenser and scrubber amounting to $5,808.00 as shown by Exhibit "184" and the cost of the 6′ 6″ set. These detailed figures while not yet included in the exhibit, will be include- so that every step I have used in arriving at these cost- may be had. This is the whole process that I have gone through, it is a little complicated because we are dealing with an apparatus that requires some complicated computations. Depreciation that 6′ 6″ water gas set of 1901 in the way indicated in the previous exhibits gives a value as of January 1, 1907 of $5,111.00 complete in position as it stands there. That is the present value as of January 1, 1907, of the Western Gas & Construction Company set.

Following through exactly the same process as to the 6′ 6″ set, bought in 1888 and called the Springer set we arrive at the new cost of $2,904.00 for the Springer set as of January 1, 1907 and a value as of that date of $1,336.00.

The next item under works equipment is the operating floor. Taking into consideration the possibility that the operating floor might be used for some other set, its new cost has been estimated on the basis of $1.25 per square foot, the ordinary cost of floors of somewhat more modern shape and construction than that is $1.25 per square foot is the basis on which I estimated the 7′ 6″ set which cost $8,000.00 total including the floor. I took the floor at $1.25 per square foot out of that contract price and am now estimating the floor separate at the same figure that I took out, namely, $1.25 per square foot. There being 947 square feet in the operating floor according to the reports of the company which amounts to $k,184.00 at a cost of $1.25 per square foot.
1161 As to that $1.25 per square foot being sufficient for the operating floor, there are several contracts I have with me relative to water gas sets installed several years ago at Springfield, Illinois and the year before last in Haverhill, Massachusetts, which carry that price, which is a very ordinary price for that construction and one that is not included in a water gas set proper in a lump sum.

The new cost of the Root #1 positive Blower is $142.00 with a value as of January 1, 1907 of $124.00. I *amy* say in general that this list of works equipment has been estimated in this way: I have put in generally my estimates on the machinery involved and have

taken the quantities of excavation and concrete of the company for the foundation and estimated the cost at 40 cents per cubic yard uniformly for excacation and any disposal thereof, and $7.00 per cubic yard for the concrete. Concerning where I got the inventory of the company's property contained in this list of works equipment,—I stated yesterday that this inventory is made up from several sources. There is the inventory that the company put in by its witnesses which applies to the first of January, 1913; that inventory has dates annexed which indicate whether the equipment was in place on the first of January, 1907, but more than that I have searched carefully the records of the company and have obtained for the greater portion of this apparatus the dates of its purchase or installation from those records. In many cases the dates will vary slightly a year or two sometimes more than that from the purchase of the apparatus by the company. That is the way this list has been made up, namely from the list put in by the company as of January 1, 1913, and eliminating those articles procured since January 1, 1907, and by inspection down at the works where all of the larger pieces of machinery are visible and an inspection of the records of the company to see what
1162 machines they have purchased and when they purchased it.

There are several slight variations from the rule about taking apparatus and equipment, such as taking only that which was there January 1, 1907. For instance, the new drum in the large station meter wasn't installed until sometime in 1907, but I have treated it just as though it was there on January 1, 1907, because the old drum was displaced shortly after that and the consumers got the use of the new drum during the greater part of 1907, that is as fair a method of treating that matter as you can make. Now a valuation of a plant as of a particular date is only an approximate method of arriving at the truthfulness and fairness in the matter and where this stuff was in use, or was put in very shortly after the first of the year, the consumer got the use of it during that year; in that case for instance, I have treated it just as though it was there on the first day of the year.

The same way with those coal gas benches. One set of those benches was extensively revamped in 1907, and I treated that as though it was there on the first day of the year.

The purifying boxes, set out in an earlier schedule, vary considerably in age,—that is one of the cases where I wasn't able to follow the age given in the schedule of the company. Three of the boxes were bought in 1892 as near as I can judge from the records; the 4 boxes in 1900 would make the boxes considerably older in point of time than the company's schedule so I treated the boxes in the matter of depreciation, on that basis and for that purpose do not set the boxes out separately as to cost. That age for the boxes is indicated on Page 30 exhibit "182."

The 10 foot station meter was installed in 1892, but the new drum mention-, which is the important interior working portion of the meter for measuring the gas which passes through it, was in-

stalled in 1907, so that to all intents and purposes was con-
1163 sidered new on January 1, 1907. So we would have for that meter as it was just as it stood erected in 1892, we would have for this between 1892 and 1906 which would be 14 years, but I have taken here only 7 years for that meter resulting substantially a less amount of depreciation because of a substantial part of the meter having been complete- rejuvenated by putting in a new drum in 1907. The age January 1, 1907, 7 years, although a large and imposing portion was bought in 1892.

Referring to the gas benches the cost and price are set down here, the benches I have separated. There are 6 benches of 6's down there and described in the following schedule as being 3 benches of ½ depth and 3 of ¾ depth;—the description referring to the depth of the furnaces,—the depth of the furnace makes some difference in the operation of the benches, the completeness with which you can get gasification of the coal before it gets up around the retorts. I have separated these benches into two groups of three partly because of the difference in depth and partly because of the age. I think the greater portion of the benches is what we call the gas bench, that word is used rather loose sometimes, meaning the whole structure, sometimes the interior part is used to mean the whole structure. A gas bench is made up properly: first we have a foundation, a rectangular slab of concrete in the ground of given dimensions sufficient to furnish footing for the structure. These benches are of the older simpler type, or what we call the horizontal retorts. Then there is built a brick arch closed on the two sides and the top and at one end with solid birck masonery walls, the other end is left open until we put what we call the filling and what is spoken of loosely as the bench,—they often speak of setting the bench meaning that you put in the material that goes inside of this brick arch,—meaning the retorts and pieces of fire clay and brick that holds these retorts in position. The re-
1164 torts being the portion of the bench in which the coal is put to head thereby gasifying it. In the construction of these benches there is a substantial amount of iron work necessary to hold it in place, the head runs up perhaps to 2,000 degrees roughly speaking, and that subjects the brick and masonery work to a good deal of contraction and expansion and it is necessary for the iron work to hold it in place. When the bench is filled we have to make the connection of the iron supports with the projecting ends of these retorts that stick out of the ground so that the gas may be carried off in these pipes. All of that iron work forms a very substantial portion of the entire structure of the bench and of its entire cost. We have in the bench three main elements, the arch, the iron work and the so called filling of the bench that is the retorts and pieces that support them.

That retort wears out pretty rapidly, they cost perhaps $24.00 or $25.00 apiece, their cost being minor items compared to the rest of the bench, but they wear from being subjected to the intense heat inside whereas the brick arch and iron work will last a long series of years. The retorts are made out of clay now, they used

to make them of cast iron, the cast iron retorts won't stand the head, not because you can't get the gas per ton of coal out of them but because they soon wear out and are more expensive than clay and clay is more in use now for making gas. I make this explanation about these benches so that what I want to say about their ages would be clear.

Referring to exhibit "182",—there is 6 benches in all,—3 of these benches were 14 years old January 1, 1907, that is the arches and the iron works which *consist* the main portion of the benches were installed in 1892, I may be mistaken and the age shown on the company's schedule is less ancient than I have indicated. As near as I can make out the other 3 benches were constructed in
1901 making them 5 years old on January 1, 1907, so I
1165 have used those ages, 14 and 5 years respectively in the depreciation of the new cost of such benches. The benches show on inspection distinctively different ages to any one with a familarity to such structures, they didn't come from the same place at the same time and look different; the iron work on 3 of the benches is distinctly lighter and less durable designed—that put in there in 1892 is heavier and in better condition.

The interior portion of the benches wearing out in from 2 to 3 years if the benches are used right along, and having to be replaced the cost being minor compared with the cost of iron work and main arches themselves. The fillings being taken care of ordinarily out of operating expenses it is fair enough and probably is the only approximation to the truth to just depreciate your benches according to their age without regard to the time when the fillings were put in because your fillings are renewed from time to time many times during the series of years your whole structure is going to last, so it is hardly worth while to inquire just when the last filling was put in. If you could find out exactly it would vary the figures a little as to depreciation and I have though- it fair enough*t* to consider the life of the structure as a whole with such renewals as must be made from time to time.

Concerning the cost of these benches as appears on page 4 of exhibit "184," the new cost of the 3½ depth benches is $7,034.00, the value as of January 1, 1907, is $4,080.00; the new cost of the ¾ depth benches of which there are 3 is $7,634, and a value of $6,489 as of January 1, 1907.

The cost of the charging floor for these benches is here given as $1,605.00 and its value $1,388.00. That charging floor has been estimated again at $1.25 per square foot, the same as the operating floor of the water gas sets. The floors are very similar in construction
both consisting of cast iron plates laid on steel beams, the hot
1166 coke is thrown out on this floor, it is right next to the benches which contain the benches and it has to be a fire proof floor.

Concerning the cost of these floors I haven't here the details of that cost, but the same benches will appear in the 1913 valuation and full details will then be submitted. The company's schedule on these floors includes so many pounds of steel and cast iron, and I thin*g* the schedule of the company shows a very much higher figure than I

have allowed for the floors. By taking 4 cents for steel in position which is a very sufficient figure, and 3½ cents for cast iron in position, and taking the weights of the company as shown for that floor the cost don't come out very far different from $1.25 per square foot, which I have estimated it. Perhaps this is as good a place as any to take up the question of the proper price to be allowed for structural steel and cast iron in these buildings, and in connection with these machines. There is a strong difference between the figures of the company on such items and those I present and I want to give the foundation I have for making such estimates as I have.

On page 13 of exhibit "220" is shown the cost to the City of Lincoln of man hole covers and rings, they being cast iron according to the drawings furnished me by the city engineer. They are furnished for a standard form of cast iron and are bought here in the city, I thing from John Westover bought largely on the basis of $8.00 each. that includes the cover and the ring and we generally speak of the combination as a man hole cover. The cast is not a particularly easy one to make in the matter of casting there is a large difference in the resulting cost whether the form is easy or difficult to cast because the molders and founders work is a large element in the cost per pound. These castings are not particularly favorable to
1167 make but are a sort of medium casting as far as foundry work is concerned, a very moderate grade of cast iron will do for man hole covers but they are fairly representative of the cast iron pieces or parts that go into those buildings. Each man hole cover and ring weight 375 pounds and the price general put as indicated by the two bills in this exhibit is $8.00 giving the price per pound of .0213 cents, the price has been raised 50 cents during the present year so they now cost $8.50 which would add 1/10 of one cent to this price per pound,—between 1/10 and 2/10 of a cent per -ound,—this additional 50 cents will add to the price per pound as figured here on the bills between .1 and .2 cents to the amount of .0213 cents per pound, and the price of 3½ cents for cast iron in position in connection with those floors, if you want to figure the floors on the pound basis, a price of 4 cents for steel down there in the floors of the gas works is very sufficient. This morning I called attention to the price of .026 for reinforcing steel in the reservoirs the city built. That steel not being fabricated, and some of it being in rather expensive form, that is a steel beam of one of the standard shapes you will find in a building as well as that reservoir, some shapes out there are more simple types than the beams. The price — for 85,500 pounds of steel and was a contract taken at .026 cents per pound on that reservoir.

In a contract for a roof over a lot of water pipes and valves adjoining the pumping station of the city and has recently let a contract for that small structure, and the price for the fabricated steel for that little structure was only 4 cents per pound and there is only a very little of it, but 4 cents for such steel I regard as liberal for structural steel, and certainly 3½ cents for cast iron in position down there as we find it is very liberal. I don't know whether that steel at 4 cents

was bought of Westover, I have forgotten the name of the contractor. I will bring in the contract and you can see who it is.

1168 That contract for building around those pipes is 4 cents in position for the steel used in building that structure.

I also have here a copy of a bill dated November 1, 1907, from John Westover to the company being voucher #2490, the bill includes among other items 97 floor plates, at $412.25 total. There is an allowance for 7 bad plates at $4.25 cents each which I judge by looking at the total figure at the average price charged per plate; I suppose they are part of the plates found in that charging floor of the benches, I measured those plates down ther- and found they were 3 feet square giving 9 square feet per plate which by dividing into $4.25 giving about 47 cents each for those plates. I don't know whether that was delivered at the foundry. I mean 47 cents per square foot at the price I have stated $4.25 each of the plates being 3 feet square amounting to 9 square feet each makes 47 cents per square foot. As to how much that is in pounds,—I am not sure about the thickness of those plates,—The company's schedule says ½ inch thick, I couldn't conveniently mention probably Mr. Westover could give you the weight. Undoubtedly while taking a square foot of plate would weight 450 pounds a square foot would weight just 20 pounds, that is just about 19 pounds per square foot and you divided your 19 pounds into your 47 cents and you will get just a little over 2 cents and under 2½ cents for those plates. Cast iron weighs 450 pounds per square foot and a plate if they are ½ inch thick will weight 1/24 of that of course. Anyway taking the cast iron at 3½ cents in position and steel at 4 cents in position will check up well enough with the weights given by the company, and $1.25 per square foot for a floor like those down there is an ordinary price; and 4 cents for steel and 3½ cents for cast iron is a very sufficient price. Plates 3 feet square and ½ inch thick are expensive to make, requiring a lot of foundry work and I would not be surprised if your cast iron plates in position run up more, and would overrun

1169 3½ cents a little but you would have enough lower cost of materials in your beams and other iron parts to pull your average below that 3½ cents. Wherever I have computed I have allowed everything on the pound basis put in these floors; I didn't consider it necessary to go into that detail, you can get your floor put right up for $1.25 per square foot if you can't tackle it the other way.

Exhibit "224" is a blue print of a drawing showing the standard cast iron man hole ring and cover used by the city of Lincoln the same as was originally sold to the city for $8.00 and which weighs 375 pounds resulting in the price per pound testified to this morning, being a plan and sectional view of the cover and as shown reveals its construction and indicates in some degree the character of the casting itself. Exhibit "225" shows the details of the construction of one of the reinforced concrete reservoirs particularly the detail of the concrete construction showing how the steel reinforcing appears, the parts which are laid into the concrete and showing the thickness of the concrete at various points. I think this is a drawing of the 500,000 gallon reservoir this is dated August 1913 and the

1,500,000 gallon one was built last year so I take it this is the detail for the 500,000 gallon reservoir now under construction. A great portion of the concrete is only 6 inches thick and undoubtedly reinforced with steel bars set with that sort of construction under the roof, sides and bottom is one that requires it to cover this cost of relatively high figure per cubic yard.

Exhibit "226" is a plan for the 500,000 gallon reinforced concrete reservoir under construction out on 17th Street. This exhibit shows the reservoir in the plan in a horizontal section and a vertical section reveals again the thickness of the walls and floor, it does not show much of the reinforc-ments, being on such a small scale. It shows that it has a length of 180 feet 2 inches and a width
1170 outside of the concrete, 33 feet 8 inches, the depth of the reservoir after its completion is shown at one point as 13 feet, taken at the deep end. What I h-ve called the deep end the ground is just level with the top of the reservoir so the excavation is 13 feet. The ground slopes a little to the other end of the reservoir so while the excavation is 13 feet at one end it is only 8 feet at the other end. Its construction is very similar in detail to that of the 1,500,000 gallon reservoir built last year. I have thought this reservoir should be explained because the prices for part of the material will somewhat differ to those on the other one. The excavation at 30 cents per cubic yard is the same; the price of steel work and concrete is a little higher. I will now show as one of our exhibits the proposal which contains those unit prices for the 500,000 gallon reservoir. I will mention now what the prices are so they may be fully understood, the 500,000 gallon reservoir now under construction the rate for excavation meaning the digging of the earth out of the ground and the final disposal of it is 30 cents per cubic yard and the quantity being 2,300 cubic yards; the concrete is 383 cubic yards that figure illustrates again the difficulty of that concrete construction. A structure as large as that with only 383 cubic yards of concrete is in here at $10.00 per cubic yard whereas on the other it was at $8.50. That amounts to $3,830.00 and the 47,000 pounds of reinforcing steel is 3 cents, the price of the larger reservoir was .026 cents per pound, all these prices are for work in place. That steel amounts to $1,410.00 and those three items make up almost the entire cost of the reservoir, there are some other little items that amount a little over $200.00 that we will not put in.

Exhibit "227" is a larger scale of the detail of one of the concrete reservoirs, dated August 1912 and undoubtedly is for the 1,500,000 gallon reservoir. I again call attention to the difficulty of
1171 the concrete work and of the reinforcing steel. That steel all has to be bent or placed with fair accuracy in the position shown and increases the difficulty of the concrete work and adds quite a bit to the market price of steel to be bent and placed in this position in small pieces, which has to be bent and fit in shape of the form of the reservoir walls.

Exhibit "228" is a plan and two sectional elevators for a concrete roof over the water pipes at the city lighting plant, these water pipes and valves are outside of the building proper. It is quite a small

structure 29 feet 4 inches wide by 64 feet long and has a depth all below the surface of the ground,—I don't seem to find the figure for the total depth,—but the head room underneath the concrete roof is 7 feet. The concrete in this structure is largely in the roof, there is some concrete footings for steel columns, but the roof is concrete and has to be strongly reinforced, being horizontal may have to bear considerable weight that may come on it from the outside being about on the ground level. The concrete is only 6 inches thick so that is an expensive job of concrete work entirely different from putting under footings. The unit price of structural steel was 4 cents in place, the city's contract for the structure called for all materials in place.

Exhibits "224," "225," "226," "227," and "228" offered in evidence by the defendant and received without objection.

The next item- in exhibit "184" being the works equipment, are the condenser and scrubber. There is nothing unusual about the treatment of those items, the cost figures have been made up by taking a fair price for the machinery erected in position and adding to the cost the cost of the foundation at $7.00 per cubic yard for the concrete and 40 cents per cubic yard for the excavation using the quantities of excavation and concrete the company as said existed in those machines.

1172 The 4½ by 25 foot condenser, in the schedule at a cost of $583.00 and has a value as of January 1, 1907 of $350.00.

The 5½ foot by 31 foot scrubber is valued at a new cost including the foundation at $319.00, that has a value assigned of $191.00 as of January 1, 1907.

The 4½ by 5 foot rotary scrubber is given a new cost of $2,138.00 and a value of $1,122.00.

The next items in the list are the 4 purifying boxes and a somewhat more difficult rule of valuation is applied to those boxes because they are all of an ancient and honorable type and would cost a great deal more to reproduce them than anyone would want to spend for purifying boxes of that capacity in this day and age. The boxes are valued on a basis of what other boxes of equal capacity but different design could easily be erected for in position.

Exhibit "229" contained in the folder on "Data considered" is one of the contract I have considered in making up my opinion as to the fair unit price of materials in connection with the construction of the gas plant. It is a contract between the City of Lincoln and G. E. Tobin for the construction of a concrete roof over certain water pipes at the city li*hg*ting plant at 30th and A Streets. This contract relates to the work shown on the blue print exhibit "228." This contract is for the amount of $1,090 in toto for the construction of this concrete roof. The unit price- relating to this work stated in exhibit "229" are as follows: excavation 50 cents per yard; concrete $12.00 per cubic yard; reinforcing steel at 3 cents per pound; structural steel 4 cents per pound. The contract was originally mentioned for its bearing on the price of reinforcing and structural steel and it is that part of the contract that influenced my judgment and on which I have relied in making up my opinion of the fair cost.

Regarding the grading work done on this particular job,
1173 I was there and saw it and made a personal inspection of the premises. The grading, including all that the term applies as applying to the soil in moving digging it is a small job but difficult one. I haven't with me the specifications for this which would throw greater light on the grading work but the impression I got from what little grading there is there and the character of it I am not at all surprised at the price of 50 cents per yard for it. I have allowed 40 cents for the grading at the gas works and most of that grading you would handle two yards to one as compared to this job here; I don't mean to make an exact statement but mean to say that the grading at the gas works is of an entirely different character and very much easier to handle.

Exhibit "230" is the proposal sheet for the 500,000 gallon concrete reservoir, now under construction by Abel & Robert, for the City of Lincoln. This proposal sheet used the price of 30 cents per cubic yard and 2,300 yards of excavation, that is the same price set out in the contract for the reservoir built last year by the same party for the city. That 2,300 cubic yards at 30 cents amounts to $690.00; 383 cubic yards of concrete at $10.00 per yard,—as against $8.50 that we had on the larger reservoir constructed last year,—that is an expensive concrete to build, it must be built with forms all the way through and highly reinforced with steel shapes; the total for the concrete was $3,830.00; 47,000 pounds of reinforcing steel at 3 cents per pound amounts to $1,400.00. The other items in the construction make up the total of $6,175.00 the price at which the contract was taken.

That is the proposal, the contract based thereon is particularly helpful in forming a fair unit price to be applied at the gas works with respect to the excavation and steel I don't think the price for concrete as any direct bearing for the price of concrete at the
1174 gas works, its character is entirely different. This excavation in both of these reservoirs taken as a whole goes to somewhat greater depth on the average than the average excavation at the gas works,—apart from the holder tanks.—I haven't mention- any price for the holder tanks yet.

Returning to Exhibit "184" where I left off I was at the subject of purifying boxes, the older types of purifying boxes as represented by those in the Lincoln gas plant of a rather wide and flat structure, usually made of cast iron. The gas passes through them for a certain purpose in its journey to the holder and to prevent the gas from escaping, there is what we call a water seal all around the purifier. That is the iron part forms a cup into which another iron part dips so that the gas passing through it at the very moderate pressure of a few inches of water can not escape. Such purifiers are required to be kept above the freezing temperature otherwise the water will freeze and you will break your purifier as the water expands on freezing. Therefore they are a more expensive type than would now be ordinarily bought and installed unless you bought some second hand appliances. I know of very few corresponding

to this type now being made and sold; I notice these are 24 by 20 by 4 feet deep they are shallow rectangular boxes.

With boxes of this old type it was necessary, at least for convenience, to put them in a building, so you can warm your building to keep your water seal from freezing, of course, you could by running pipes as in the case of holder tanks and gates, keep the water from freezing but if you built out of doors you would have to build some sort of cover in the way of masonery or concrete covering for such boxes. A word about England where the practice is very common this type of boxes have usually been put in a building and the purifying boxes with the flat side set in a horizontal position,
1175 which takes a building with a good sized ground dimension to hole such a purifier as you find in this plant, and the purifying house which is the name of the building has double the cost of any other building on the schedule, the most expensive, being $12,577.00 on the basis of my estimate, and more than that on the basis of the company's estimate.

For modern purifiers to be installed no such building would be necessary or desirable because the practice is rapidly growing when installing purifiers to install them differently from the manner found at the gas works and one which does not require any building and the purifiers being made in different forms it is not spread out like these here. It is cheaper to make them per cubic foot capacity and it is that which regulates the gas capacity of purifying boxes. The modern type box is made deeper than those here something like 8 feet deep, and in a rectangular or circular form but very much deeper perhaps 10 or 12 feet deep. It is the growing practice to put these boxes out of doors,--partially because no building is necessary and it saves the cost of a building,—the cost of this building here is nearly double that of the purifiers themselves and this type of purifier is expensive. In modern purifiers the use of water to prevent the escape of gas is dispensed with. Rubber or some other substance like asbestos is used to make a tight joint so the gas may not escape in passing through.

This being briefly the facts about the art of making purifiers and the practice of installing I have not felt justified in valuing the price on these boxes at what it would cost to make boxes of that kind, because I could buy boxes of a better kind for less money. I have valued the boxes down there by this process; I have considered the cost of boxes that would afford an equal cubic space capacity and have taken that cost at a figure at which the thoroughly
1176 modern type of box,—which might just as well be put out of doors,—could be had for as shown by various contracts. I have with me several contracts that relate to this matter one relating to the purifying boxes at Springfield, Illinois, where they have recently installed this out door type, another at Holyoke, Massachusetts, installed several years ago; another at Racine, Wisconsin. It will be notice- that I have added the cost for the purifying buildings into the sum total of buildings leaving it to be dealt with if at all later, I thought it desirable to show the cost of the buildings built on the basis I have mentioned. I think it just as well to dispense with

it, nobody would erect that building today to take care of the purifier.

The boxes at the Holyoke, Mass., plant,—a city owned plant,—cost erected complete on foundation furnished by the city including the support steel work for the purifying boxes and other intermediate connections 94.4 cents per cubic foot. It is a nice job of work very substantially built, with provision for handling the purifying material which is a compound of oxide of iron that must be lifted in and out of these boxes. That is illustrated to some extent by the fact that the bare purifiers erected at the Springfield, Ill., plant at a cost of 42.7 cents a cubic foot wasn't as high class a job as the Holyoke, job nor as complete, the facilities for handling the materials, etc., are not as good.

In the valuation by the engineers of the Wisconsin Commission at Milwaukee last year of some purifying boxes they gave the new cost of those boxes at 81.4 cents per cubic foot, I presume the value is very close to that and I think the boxes are nearly new and that valuation includes the purifiers complete with whatever foundation they have.

Now these costs per cubic foot I have given are somewhat lower than the cost per cubic foot of such apparatus as exists at the
1177 gas plant here, while I have thought it fair to value these purifiers on the basis of a modern type of purifier, I have not put it down as low as it might be for that type of purifier. I have valued that apparatus down there on the basis of a new cost of $1.00 per cubic foot including the foundation. The cost of the 4 boxes has been made up in that way,—we have 3 boxes and one which is different and the amount of computing there on is some different,—one box has 1,920 cubic feet, its cost set out in Exhibit "184" at $1,920.00, a dollar a cubic foot. Now the 3 purifying boxes given on the same basis at a cost of $5,760.00 and the value of the 3 boxes is $4,147; and the value of the one box is $1,690.00.

At the price I have mentioned, $1.00 per cubic foot would erect today and would in 1907 purifiers of the type spoken of and very economical to operate, and with very much less labor in handling your material which must be moved in and out of your purifiers is done more expedi-ously and with less labor than for those boxes down there and I put on that liberal valuation based at $1.00 per cubic foot. I have the Springfield and Haverhill contracts for purifying boxes here which are subject to inspection.

The next item in the list of works equipment is the 10 foot station meter installed in 1892 and a new drum, which is the interior working part, was installed in 1907 while the meter would have an age of 14 years because the outer part was 14 years in 1907 I have taken its age as 7 years on account of the renewal of the important part the interior of the meter. I gave the new cost of the meter including the foundation of $3,940.00 and a value of January 1, 1907, of $3,250.00.

The 6 foot station meter is given at a new cost of $1,250.00 and the value of $500.00 which being a pretty old piece of machinery and subject to considerable depreciation.

I remember there was considerable discussion about the
1178 utility of that meter when the company put in its case. I don't think it should be objected to using items of the plant and useful in the gas business.

The next item and an important one is the 200,000 cubic foot gas holder which I have given here at a new cost of $18,000.00 and a value on January 1, 1907, of $15,480.00.

Again it seemed to me necessary to arrive at the valuation of that 200,000 cubic foot holder by considering what would have to be paid for a different type of holder of the same capacity. I am not valuing a theoretical holder that don't exist, I am valuing that holder down ther- or I am trying to value, it by considering what it would be worth to a man who wanted to use such a holder in the gas business. I conceive it would be worth to him no more than a holder of equivalent capacity and utility minus the life that has gone out of that holder and that is the basis on which I have valued it. The company's schedule gives a great deal of information about the pounds of cast iron and steel, ect., in the gas holder, it is interesting, but holders are not commonly bought and sold as so many pounds of iron and steel, any more than a man lets a contract to have a house built on the basis of so many thousand feet of lumber and kegs of nails. Holders are invariably built by manufacturing concerns having extensive works for making gas holders and other articles used in the gas business, they are complete and usually tested and turned over in complete working shape to the party who pays the money. I think it is as common and accurate a method as any other to consider the price of holders at so much per 1,000 cubic feet of capacity that is what it comes to, gas companie's contract for a holder to supply what they want. In well drawn holder contracts the thick-
ness of the plates and parts of the holder are usually specified
1179 because that is a matter that bears on the strength and goodness of the holder. So in putting an estimate on the cost and value of a holder it isn't profitable to go into the question of the amount of material measured in pounds in gas holders.

I have valued this by arriving at what I though a holder of equivalent capacity but of different type could be bought for, and then depreciating from the purchase price a reasonable sum on account of and to the extent to which these holders are worn out and gone. A word about the type of this holder, the type is the reason I adopted this method of valuation, they are a type not now being built, I don't know of a holder of that type being built in Massachusetts during the last 10 or 15 years, I understand it to be claimed for this holder it was built for a special reason. It is the masonery type holder in which the part that contains the water consists of a masonery tank embedded in the ground and out of which works the iron cup shape structure containing the gas. To build that tank in the ground cost more money than to build a steel tank above the ground and put a shallow foundation of concrete under it. The modern or prevailing type of gas holder today is with the foundation built above ground generally of steel there have been and there are a few built with a reinforced concrete tank built above ground, or em-

bedded a little way in the ground, but the preva-ling type is the steel type tank gas holder corresponding to the type of the 500,000 cubic foot holder the company erected in 1908. The 200,000 cubic foot holder was built in 1890 and they simply followed in building it the somewhat belated practice of that time. The steel tank holder even in 1890 was rather extending its usefulness. The steel tank holder is preferable to the masonery tank holder for various reasons, and a steel tank holder of 200,000 cubic foot capacity could readily have been built down there foundation and all, for $90.00 per 1,000 cubic feet. That is the way they commonly estimate gas holders
1180 and being a 200,000 cubic foot working capacity, you would get on that unit basis a new cost for the holder complete with foundation, at $90.00 per 1,000 cubic feet for that 200,000 cubic foot capacity amounting to $18,000.00.

I want to call attention to some of the holder contracts I have relied on in arriving at that valuation of that 200,000 cubic foot holder.

I will refer first to a holder of 250,000 cubic foot capacity recently constructed in Framingham, Massachusetts, I have inspected the holder, it is well built and compares favorably in construction and general weight of the parts and workmanship with the 500,000 cubic foot holder at the gas works here. I compare it to that holder rather than the old holder because the old holders are of such a different type that they are not readily compared with a modern type of holder. The Framingham holder was a 250,000 cubic foot holder or 25% greater then this one at a total cost of $19,786.00 which figures out $79.14 per 1,000 cubic foot capacity, is almost $80.00. That includes the foundation; the cost of the steel alone was $74.40 per 1,000 cubic foot capacity, the cost of the whole thing was $79.14 per 1,000 cubic foot capacity.

In Illinois several months ago they were constructing a 1,000,000 cubic foot holder which gives it a lower price per unit capacity than any we have here, but that would throw some light on the matter. That is at Springfield, Illinois. The contract for that holder amounts to $60.00 per 1,000 cubic feet capacity; the price of holders per 1,000 cubic foot capacity goes down as the size of the holders goes up, that is, the cost of that Springfield holder was $60,000.00 for the steel alone, the steel work was covered by the contract with the Stacy Manufacturing Company and was $60,000.00 amounting to $60.00 per 1,000 cubic foot capacity. I have mentioned
1181 the holder they have bought at Framingham within the past year, I am quite sure that was only 25% greater in capacity than the 200,000 cubic foot holder down here which would make it a very good criterion of the cost, there is that much different in capacity but it would not vary the cost per unit very much, yet we find in the Framingham holder the total cost was about $11.00 per 1,000 cubic feet less than I have allowed for the equivalent of a 200,000 cubic foot holder here in Lincoln. I will take a holder that has only ¾ of the capacity of the 200,000 cubic foot holder. This holder was built at East Hampton, Massachusetts, I think within

the past year, I am not absolutely sure about the date. The cost of this holder was $13,500.00; the cost of the steel alone was $76.00 per 1,000 cubic foot capacity, when I say steel alone I mean for the complete parts of steel erected there by the maker of the holder complete and in working order and the total cost of that holder is $90.00 per 1,000 cubic foot capacity that was only ¾ of the capacity of the one here and as I said the price goes down per unit of capacity as the capacity increased, so whil- this East Hampton holder cost $90.00 per 1,000 cubic foot for the 150,000 cubic foot capacity the Framingham holder of 250,000 cubic foot capacity was only $79.00 per 1,000 cubic foot capacity and I have here allowed $90.00 per 1,000 cubic foot capacity for the 200,000 cubic foot holder.

I have a record of a large number of holder- but these serve to illustrate the matter. I think that a modern holder of steel tank construction, that would be on the whole decidedly more desirable than the masonery tank holder could have been put down there as of January 1, 1907 for a total cost of $18,000.00. There isn't the slightest doubt about that. I want to read one paragraph dealing with the fact on this method of valuation that I have adopted and used in this valuation of the Lincoln gas plant. This is from a case
in which Mr. Justice Pitney, then Vice Chancellor and who
1182 is now on the United States Supreme Bench, wrote the
opinion.

(Mr. Strode: I want to say if you are going to read any decision I want to object as incompetent.

Referee: It may be read. (Exception.)

(Witness continuing:) This case came up in the form of a bill to enjoin the water company from discontinuing the supply of water for public purposes in certain parts of the city and there was an agreement between the parties under this bill that the bill was amended to ask an determination by the court of a reasonable rate for public and private service: that is found on page 74 of the original report so that the court had the matter fully in hand to go ahead and deal with the property as to establishing a foundation for a reasonable rate. The court found in many parts the property was not of the kind and character that would need to be built for serving the consumer of water service by this system and the court finding that a dam was too large deducted a substantial sum from the cost because it said a smaller dam would have been big enough for the reservoir an- deducted for some of the pipes which the court said was not necessary, being the case of the Long Branch Commission vs. Tintern Manor Water Company, 70 New Jersey Equity, page 71, decided in 1905 and the paragraph is found on page 90 of the report and is as follows: "I deduct then from the $1,500,000.00 as follows:

| | | |
|---|---|---|
| Whole cost of works | | $1,500,000.00 |
| Loss on Takenassee | $100,000.00 | |
| Over cost of 36 inch main | 75,000.00 | |
| Over cost of dam | 30,000.00 | |
| Over cost of reservoir | 25,000.00 | |
| | | $230,000.00 |
| Leaving | | $1,270,000.00 |

as the amount upon which the defendant ought to receive dividends."

I just allowed then what was necessary to construct a plant
1183 suitable for that service as I understand the case, and the court did not allow them the cost of reproducing the plant that was there, simply the cost of producing a plant of equivalent capacity.

The $50,000 cubic foot holder at the works if of the masonery tank type; the iron part of that holder appears to have been moved from the old plant and the masonery part was built where it is, as that is not movable. Now the same consideration applies to this 50,000 cubic foot holder that applied to the 200,000 cubic foot holder, namely, that is *is* of a type which works well enough for holds and send out the gas, but cost more to have built the present day because people can build a holder of equal capacity for less money. The holder works well enough but it cost too much money per unit capacity to build it. I am not denying that it will serve the purpose only I don't want to pay too much for the service. I am giving what I consider this plant will be worth to a man who had the right and wanted to use it, I don't know as an engineer whether the sum this plant will be worth to a man is the proper test for fixing a rate or not, it may be that what remains of the investment once made is the best test for fixing the rate. I am talking about values and as near as I can find out it is what somebody who wants a think would be willing to give for it, rather than going ahead and building a new one for himself. Or perhaps what the city would pay for it if it saw fit to take it over on condemnation, I think the same rul- would apply there. Of course, if the city took this plant by condemnation, while I think the same rule would apply to measuring the value of the physical property, the city might have to pay for the value of the business which the company had acquired, but that is an entirely different thing from the value of the physical structures and I have expressed no opinion on that, the business could just as well be carried on with other
1184 physical structures.

In the case of the 50,000 cubic foot holder we have an illustration of the way in which we have the cost of gas holders going up as the capacity decreases, I have no idea that if the company dedn't have this small one that they would ever build one of that size, this was built in the infant days of the industry in Lincoln back in the 80's, I don't think it would be profitable or desirable to build a holder of that size on these works today, but it is there and useable

what there is of it so I have valued it as though anybody who would be induced to build so small a holder on so large a works would give for it.

Taking that holder at 50,000 cubic foot working capacity and comparing it with other gas holders of similar capacity whose cost I know, I have fixed as a fair cost for a well built steel tank gas holder of 50,000 cubic foot capacity $160.00 per 1,000 cubic foot capacity giving you $8,000.00 as the cost of a steel tank holder of a capacity equal to that masonery tank holder at the gas works.

From that $8,000.00 there is to be deducted the depreciation gone out of the holder by reason of age and use, which is computed in the way already indicated on the age of the holder and its estimated life and reduces the value of the holder on January 1, 1907 from the estimated cost of $8,000.00 to $5,120.00 for value. I think in allowing $160.00 per 1,000 cubic foot capacity I have allowed an ample figure for the cost of a steel tank holder with foundation erected complete in position down on those works.

The remaining items on page 7 call for very little comment. I have taken the 20 inch Connelly governor at what I consider a fair price erected and depreciated it according to its age.

The pumps I have assumed the price I believe were put on them by the company and depreciated them according to age.

The photo meter I have given the price for which I think a photo meter should be bought that is $300.00 and depreciation
1185 according to what I believe its age to be. That is one of the cases where my understanding of the age of the equipment is quite different from that expressed in the company's testimony.

There is nothing special about the valuation of the other items worthy of mention until we come to the Tar Tanks; there are 4 old boilers used as tar tanks which have been valued at so much per pound in position.

A boiler isn't usually built for use as a tar tank, and the expense incidental to constructing boilers is quite different from the expense of constructing tar tanks, so if you find a boiler used as a tar tank you must make a fair allowance for what tar tanks built as such would cost of equal capacity rather than the actual weighing up and estimating the weight of the material that may have been put in to resist 100 pounds steam pressure, it don't correspond to the trifling pressure that exists in the tar tanks. I didn't think that anybody would think of acquiring them by purchase for use as tar tanks would consider what material was in them, I would consider what I would have to pay for tar tanks constructed as such, and I have taken those boilers and estimated at the new cost of tar tanks of suitable construction on that. I estimated it at 3.7 cents per pound in position and have assigned a proper weight to the tar tanks of the capacity those old boilers would have if the tubes were not in there, the fire tubes take up considerable capacity of the whole tank I didn't figure them, I figured as though they were all holes and you could fill the holes with tar. They didn't have a foundation and I didn't add anything more. There is a couple of small brick tar wells down there and I assumed the cost the company put on those

tar wells and simply depreciated them according to their age as small items. The price assigned for the tar tanks is the same as you could acquire tar tanks of the same outside dimensions put in position which according to my estimate is $393.00 for steel tanks.

1186 The next item is the two oil tanks 8 feet in diameter and 24 feet long. I have put these two in one item because the company followed that course in its schedule, I have endeavored to follow the arrangement adopted by the company for the convenience of the court and parties. Those two tanks have a foundation. I have figured the tanks in position for 3.7 cents per pound for a suitable weight of metal in such tanks, and have figured the foundation at the quantities shown by the company to exist there, estimating those quantities at $7.00 per yard for the concrete, and 40 cents a yard for the excavation involved.

In connection with the price of 3.7 cents per pound on those tanks I call attention to one or two bills of the company for some similar tanks. It is my intension to throw into exhibit all the bills of the company substantially, that have been relied on as furnishing a basis of cost, that work hasn't been complete yet. One of the bills to which I refer and which has been helpful in considering a fair price to put on the tanks per pound is from the Graver Tank Works, East Chicago, Ind., July 20, 1909, two cylindrical tanks 10 feet 9 inches by 29 feet 6 inches shipped by I. H. C. O. C. & N. W. car V. T. company #115, voucher #6380 price of the tanks $630.00. Also another bill from William Graver Tank Works, East Chicago, Ind. to this company on November 22, 1910 for two cylindrical tanks 10 feet 6 inches by 24 feet 9 inches at $335.00 equalling $670.00 less labor driving leaking rivets $5.00 leaving $665.00; the price of the tanks was obviously $670.00, voucher #8085. I also wish to refer to this order for the above tanks to William Graver Tank Works East Chicago, Ind., for delivery on requisition and account as indicated on margin for the following two oil storage tanks 10 feet 6 inches by 29 feet 4 inches, ¼ inch heads and 3/16 inch shell, price $670.00 f. o. b. factory. That was signed by Harry Warner I don't recall who he is. The date as I understand by the reading of the entire document, it was shipped to the company in Vt. and Company car

1187 #506 and the following words Lincoln Gas & Electric Light Company, Lincoln, Nebraska 9/8/10 that is evidently the date of the order. And in connection with that I may also read a statement which appears with the above heading, Statement #2519 November 22, 1910, $506.00 frt. C. B. & Q. Chicago to Lincoln 551 at 1 cent per mile at $5.51. The 506 appears to be the car number that was mentioned in the shipping directions for those tanks. I call attention to Mr. Lea's report and mentioned as the cost price of those tanks which may be compared with the price mentioned in these bills. I find in Mr. Lea's report at page 55 in the department called "Net construction cost" the following entry: two steel car tanks diameter of each 10′ 6″ length each 29′ 3″ thickness of steel ¼ inch, foundation concrete and wood, tanks steel 25,000 pounds net construction cost $1,149.00". These I understand to be either the two tanks that were bought at $630.00 or the two at

$670.00 having been bought in 1909 and 1910 respectively. And following in this valuation a number of items for excavation and concrete, etc., making up the foundation which raises the total cost to $1,587.00 for those tanks. The cost of the steel alone is $1,149.00. Following agains there is the entry: "Two steel tanks diameter 10' 9" length 29' 3" thickness steel ¼ inch, foundation concrete and wood, tanks steel 25,727 pounds, net construction cost $1,158.00, there follows other items for foundation which raise the total for the tanks as a construction cost to $1,855.00. Those tanks are not involved in the valuation of the property as of January 1, 1907 because they were not then in existence, but they have aided me along with other figures that I have, in fixing a fair price per pound on steel tanks delivered here in Lincoln. The price per pound for those tanks figured out as I remember, I think is about 3.2 cents. I will confirm that however.

I value the last tanks I mentioned one of 8' in diameter and 24' long and one of 8½' in diameter and 30' long at 3.7 cents per pound in position, which is more than those tanks cost in Chicago
1188 and more than enough to cover the cost of bringing them here and setting them in position on the foundation. For the foundation I have taken the quantities given by the company and applied 40 cents per yard for the excavation and $7.00 for concrete.

On page 8 of exhibit "184" are a number of items as to works piping. That piping existed in 1907. It is impossible to find out what some of it cost because it has all been changed about gone and I have simply carried into this cost column the figures of Mr. Malone who testified here before as an expert from Denver who was there at the time and made an estimate on behalf of the company. That was not Robert Malone. These figures I have taken from the records of this case from Mr. Malone's former testimony, I just assumed those figures in view of the situation, I have stated that the things have largely disappeared from view. They were figures of the company and without stopping to pick them out individually I would say that they are on pages 236 to 242 of the printed record of this case as printed for the United States Supreme Court.

I have also taken the horses and wagons from the testimony of Mr. Malone in that schedule the item being $2,035.00, I have carried through both the cost and values column without changing as it is an amount that might have been invested in such property at that time and used by the company, and not having any definite information as to the condition of the wagons or — much they were depreciated, I haven't depreciated them any. I am not in the habit of applying any depreciation for horses but taking them for what they are worth and the condition they are found in.

Mr. Malone's items for office furniture and fixtures with some other items of office equipment and maintainence, found on page 420 United States Supreme Court Record in this case $3,560.00, and it appeared to me that the division of that at about half and half was all right, so I put in the cost of that furniture $1,780.00 or
1189 on*e* half of Mr. Malone's estimate for the whole think and inasmuch as that furniture was pretty well depreciated as far

as its use in that business was concerned, I depreciated it down to $356.00 as of the first of January 1907. It is my present understanding that that furniture has gone out of use, it was pretty near gone then. That finishes works equipment the division of the horses and wagons and office furniture into the works equipment isn't very accurate but the amount is small relatively to the other items and it has been added right in, and gives the total of $85,518.00 for the new cost of the works equipment, which is reduced by depreciation to a value of $63,801.00 on the first of January 1907. Those are the figures I have carried forward into exhibit "180" foll-wing the items for works equipment.

Continuing the explanation of exhibit "184" where we left off yesterday, we had just reached the distribution system of the gas plant the figures for which in the total cost and value are given on page 8 of exhibit "184". The distribution system is there divided under the following heads and the cost and values assigned accordingly: cast iron mains; steel mains; service pipes; meters; paving over cast iron mains; paving over steel mains; paving over service pipes.

Regarding the item of paving, I may as well explain here as anywhere that in making valuations, I am subjected to all the disadvantages of consistency. If I find paving over a main which somebody wants for the purpose of the gas business and has a right to use it for that purpose the question relative to the cost and value in my mind is whether or not the prospective owner and used of such main must lay it under paving like the ones he finds, or whether he can find a suitable place to lay his main without having to cut through the paving and replace it. If the prospective purchaser of the
1190 gas plant must lay the main under the pavement in order to carry on that business I think he will give more for mains that lay under paving. If present value is the test,—and I am trying to show here the value of this property to a prospective user who wants it and has the right to use it,—that test I applied yesterday in the case of the gas holder and purifying boxes and suggested the proper application to the purifying house itself, and I don't think any well advised purchaser of this gas plant would ever be willing to pay for the reproduction of the purifying house, the same way with the purifying boxes, they being of a type that cost more per unit capacity, the holders the same way, than equally efficient and effective holders of modern type but less cost. I don't believe that such purchaser would be willing to pay more than the cost of the present day holder and boxes less depreciation for those holders and boxes.

Now the same rule,—if we are going on the basis of value what somebody may give for it,—it seems to me the same rule applies to mains, if the main is under the paving and the main to carry on the business must be laid under paving, that is the crucial point,—and the prospective purchaser of this plant whose mind we have to look into to arrive at the figures for the cost and value will give more for a main under paving than one that isn't if he must lay the main under paving provided he doesn't buy it already there. On the other hand, the mere fact that a lot of mains are under paving would have no influence at all on the mind of the prospective purchaser; he wouldn't

care. So I have thought relative to this matter of paving over mains that the question really was, so far as value is distinguished from investment is concerned and to that extent if any: Would main have to be laid under paving if these gas mains were to be duplicated in such a way as to enable the business to be carried on as effective as it is now. To my mind the question of present value is one en-
1191 tirely divorced from the question of investment. If we are looking to see what has been invested in the public service property we take the cost of the property not as of the date when we take it but the actual cost that applied to that property when it was procurred by the company, and taking the investment for a moment as the possible basis of fixing the rate would seem to me any suggestion about the value added to the mains by reason of their being under pavement, would be entirely superfluous. Investment can not be considered only so far as it is still there and useful. The mere fact that it was there invested at some time and has since gone away wouldn't have any particular bearing.

If we are going to foreclose the investment theory and invoke the proposition that the basis of rates is to be the present fair value of the property I find myself obliged to look at everything from the standpoint of what I think a person who wanted to use that property and had a right to use it would give for it. That applies equally to the other parts of the equipment. The mere fact that equipment of a certain kind existed is not at all conclusive to my mind of the subject of present value. The question is, what equipment would have to be added to the business as well and what would be the cost to get that equipment.

I thought I ought to make that explanation because I have here ignored the paving over some of the mains obviously against all interest of my client in this case and by the same token I have considered the value of the gas holder and arrived at a conclusion of a value of it by considering what a new and sufficient capacity of holder of modern type could be bought for.

On exhibit "184" the footing for the cost of the distribution system in toto is $229,135.00 and for the value as of January 1, 1907, of the entire distribution system it is $178,890.00.

The mains of this gas plant in common with others while more or less similar in kind have been procured and installed at widely different periods of time so the computation about their cost
1192 and value takes a somewhat different form than it does in the more simple items of buildings and small pieces of machinery that was all constructed at a single date. Page 11 of exhibit "186," and in connection with exhibit "186" I call attention to exhibit "203" which is on page 25; I have adopted the process shown in exhibit "203" on page 25 to arrive at the quantity of mains that existed prior to the year 1903. Exhibit "203" is entitled "total gas mains in Lincoln January 1, 1913, per testimony of Mr. Brodnax, minus mains laid in Lincoln during 1903 to 1912 per gas company's reports, showing mains in January, 1903."

In exhibit "203" in one column is the various sizes of mains, in

the next the feet of mains as of January 1, 1913, per testimony of Mr. Brodnax as finally corrected, as I understand the corrections.

The next step was to take the records of the gas company as shown in those so-called gas reports for the quantities of mains laid each year beginning with 1903 and ending with 1912, of the different sizes, that is also shown in the next column of exhibit "203" and quantities so laid by the company from 1903 to 1912 inclusive are deducted from the quantities which Mr. Brodnax says existed January 1, 1913; and that deduction is taken by me to leave the mains that were in the earth January 1, 1903, as shown in the feet of each sizes in the righ- hand column of exhibit "203." As near as I can find the greater part of the large cast iron mains of the company were laid a good many years ago considerably prior to 1903,—if they were not the more correct way of computing the depreciation on the same would be to consider the cost of the mains as of January 1, 1907, the date of the valuation and set down those cost- as against the year in which the mains were procured or laid, to get the true and just age of the investment in mains. It happened here that the investment in mains was very large in the earlier years and has dwindled some in later years. That is true as to the investment
1193 per foot of mains,—having been the practice of the company in later years to lay generally small mains,—where it has a considerable quantity of large mains laid in the earlier years.

On page 11 of exhibit "186" the first bunch of mains of whose cost is to be taken, is the quantity of mains that were in the ground on January 1, 1903,—the company apparently began to lay mains of the cast iron sort about 1876 as per the corporate minutes and also from a contract in one of the books in account with the superintendent to lay the contemplated mains about 1875. I produce a contract on the blank page in the front of Journal "A" of the Lincoln Gas Company,—the first journal of the company,—dated April 9, 1875, and runs between the company and E. Lawson. It provides for the compensation of $45.00 per month to Mr. Lawson. Without reading all of it as it would be included in the exhibit, I will read this sentence: "His duty is to have the general supervision of the works and do all of the work with an assistant when necessary and also lay all of the iron mains which are in contemplation * * *" so that in 1875 they were at least contemplating some iron mains.

From the corporate minutes of the Lincoln Gas Company is found the following information and at a meeting of the stockholders in a meeting January 18, 1876, recorded on page 47 the following resolution was offered by D. C. Hull and on motion accepted: "Resolved, that it is the sense of this meeting that the present wooden main in use by the company should be taken out as soon as practicable and replaced with iron piping, and that the National Building Company who hold a judgment against the Lincoln Gas Company be asked to wait for the payment of the same until such time as the company can pay by the earnings of the company after payment has been made for the above repairs."

It is the intention to offer various extracts from these corporate

minutes relative to mains so while considerable more *more* is
1194 included in the minutes I will not burden the record by reading it now. I am merely coming to the point that the cast iron mains appear to date from 1876 and it is that quantity of mains which was laid between 1876 and January 1, 1903, that is dealt with in exhibit "186" opposite the entry "before 1903."

As shown by exhibit "186" the method of estimating the cost of mains is as follows: Each size of mains laid in a particular year, or laid before 1903 in the left hand column against the size of the mains is given the length in feet that had been laid and against that length in feet in the next right hand column the estimated cost per foot complete without regard to any pavement over it, the cost of paving being estimated in another place by a separate computation.

The cost per foot applying to each size of main is applied without variation to the mains laid in each year beginning with those laid before 1903 and running on down through to those laid in 1912. Necessarily so because the number of feet are taken as of January 1, 1907, and give thereby only one cost per foot as of that date. The cost per foot of mains is as follows: meaning mains laid complete in the ground ready for the transportation of gas, and these I now name are the cast iron mains which I have treated separately from the steel mains; 3 inch 37.7 cents per foot; 4 inch 40.2 cents per foot; 6 inch 62.4 cents per foot; 8 inch 82.3 cents per foot; 10 inch $1.9 per foot; 12 inch $1.379 per foot; 16 inch $1.928 per foot; 20 inch $2.838 per foot. This unit cost per foot of pipe includes everything in the completion of the main system, including trenching, leveling and leaving the mains complete as they were January 1, 1907, with the exception of paving.

The extent to which the large mains were laid before the year 1903 is shown by the footings for that year of feet and the total cost. Ex-
hibit "186" contains the footings of feet laid and total cost of
1195 mains laid in each year except as to the mains laid before 1903, as already explained that group of mains represent all that had been laid since 1876, not being able to separate them into different years they simply stand as one group and there is a footing for that group and subsequent to that there is a footing for each year showing total feet of mains laid and the total estimated cost thereof.

Prior to 1903 the footing of mains laid amounts to 107,177 feet and the total estimated cost of those mains is $62,978.87.

Referring only to the cast iron mains both as to length and cost. There was at different times a substantial amount of steel mains which will be estimated later.

The unit prices I have mentioned have been applied indiscriminately in each year down through this period of years from 1903 to 1907, and in each year,—except the series of years before 1903,—the feet of mains is shown in exhibit "186" and is the feet shown as laid in the gas reports of the company from 1903 to 1907.

The lightest year for laying of mains which is shown on exhibit "186" is the year 1906. The footing for feet of mains laid down to January 1, 1907, amounts to $127,213 feet of cast iron mains, and

the total cost estimated in the way I have indicated applying the same price to the mains laid in each year is $73,178.40.

We have now obtained in exhibit "186" the cost of the mains laid each year as of January 1, 1907. That is what those mains would cost in those years if they had cost the same as mains laid on January 1, 1907. We have simply divided that cost into the different groups according to the age of that investment in mains. The purpose being to make a fair allowance for depreciation. I used that unit of cost as of January 1, 1907, invariably, but instead of taking all the mains together and applying the unit cost indiscriminately whenever they were laid, I separated the mains into groups
1196 when they were laid and thereby getting the different sums which would have been incurred as the cost of the laying of those mains had the cost been just as I had estimated it to be on January 1, 1907. That gives me the dates of the investment in the mains and the depreciation we measure in terms of dollars so it is desirable to have the age of dollars rather than the age of the feet of mains on the average.

The process of computing the depreciation of the mains is shown on page 13 of exhibit "188", the footing showing the cost of the mains laid in each year on the basis of January 1, 1907, prices are carried from exhibit "186" into the first half of exhibit "188" which is entitled "Cost and Value of the Lincoln cast iron gas mains as of January 1, 1907." In that tabulation is given the year in which the mains were laid in the left hand column; then follows the total estimated cost of the mains laid in the respective years; then follows a column entitled the years old, that is, the age as of January 1, 1907; the next column to the right is entitled "percent depreciation" meaning on the mains laid in each year of the respective years, on the basis of 1% per year. I have not assumed that all of those mains were 17 years old that is those that were laid before 1903 on the average. Again explaining how that average was obtained, mains laid in the year 1902 which would be the first year before 1903 would be 4 years old and a little more on the first day of January, 1907, being scattered through the year 1902 it would be 4 years and some months old at the first day of January, 1907; that takes care of the figure 4 which appears in the column of years old. Now the figure 13 which appears in that column and is added to the figure 4 making 17 years is arrived at in this way; between 1876 when the company began to lay mains and 1902 is 26 years it is more than fair to the gas company to assume that they laid mains greater in length proportionately to the year than simply that they laid a proportionate feet of mains. The column entitled "depreciation" in exhibit "186", is arrived at by multiplying
1197 the percentage of depreciation of the mains laid in a particular year into the estimated cost of those mains which gives the dollars of depreciation for the mains laid in each year.

The right hand column entitled "dollars value January 1, 1907," is obtained by subtracting the depreciation so estimated on the mains laid each year from the estimated new cost of those mains. Taking the footing in the first tabulation of exhibit "188" the total

cost is $73,175.00,—that varies about $3.00 from the total cost shown in exhibit "186" and for the reason that in making these depreciation computations I don't commonly carry over the odd cents but simply carry over the dollars total cost estimated for the mains in each year which makes several dollars difference but that is immaterial in a case of this kind.

The total cost of mains as of January 1, 1907 (exhibit "188") is $73,175.00; the total depreciation estimated according to the actual age of the mains back to 1903 is $10,821.00 estimated in the way I have indicated; and the value as of January 1, 1907 is $62,354.00 representing the difference between the depreciation and the new cost.

In this connection threr should now be considered the figures set out in exhibit "189" on page 14 of the valuation folder.

Exhibit "189" is entitled "total cost in cents per foot of gas mains in Lincoln as of January 1, 1907" giving in detail the cost in cents per foot of the different sized gas mains that existed in the City of Lincoln. The exhibit includes both the steel and cast iron mains, but the cast iron mains are now only being dealt with at this time. The exhibit is headed in the different columns with the sizes of cast iron mains that existed in the City of Lincoln and is made up in two parts because too wide for the ordinary sheet of paper.

1198 The sizes of 3, 4, and 6 inch cast iron mains are treated in the upper half of the exhibit and in the lower half the 8, 10, 12, 16, and 20 inch and the figures that follow along down in each column relate to the respective sizes of the mains at the head of the column. At the left hand in the column of typewritten items the first word is "inch" meaning the inch sizes corresponding to the figures at the head of the column. Then comes the words "trenching and filling" those figures for trenching and filling refer to the entire estimated cost of removing the earth from the trench where the mains are laid, of replacing the earth in final form and of disposing of any fractional amount that needs to be disposed of, graded or hauled away.

The next item is "carting and laying" which refers to the handling of the mains from the time it leaves the car on the railroad tract to the time it is fixed in position in the trench ready to carry gas.

The next item is "total labor" and the entry in figures opposite those words represents the entire estimated labor on mains as measurer in cents per foot for each size of mains included in the plant, and is found by adding together the figures for trenching and filling and the figures for carting and *al*ying of the mains.

The next entry down the column "joining material and incidentals" and includes all the material used in making the joints in the mains,—mains ordinarily being supplied in lengths of 12 feet and have to be a joint made with often some incidentals, for instance a little piece of plank to lay under one end of a m*ian* in a wet place and various and divers amounts of material that may be required. This amount is intended to take care of that.

Footing up the above items in each column gives the next entry

which is "all except iron" including all of the minor quanti-
1199 ties of material for joints and otherwise, and all items of labor connected with it for taking the mains from the cars and getting them in the final position and in working order in the trenches.

The next entry which is "Pipe and 3% for specials" that entry is intended to include the entire cost of the pipe and all the specials used in connecting it,—all the valves and drips in connection with it. I have first computed the cost of the pipe at what I think is a fair weight and price per ton and adding 3% to that cost to cover the cost of all these specials used in connection — the pipe and also the valves and drips. That is f. o. b. Lincoln.

Adding now the cost of the pipe and specials to the other items gives the total estimated cost laid for each size of pipe which is indicated in the next to the last line of the tabulation.

It will be noticed that all these computations have been carried through to the 1/100 of a cent for the purpose of accuracy, because where you have a number of small items to add and leave off the 1/100 of a cent you make an appreciable difference on the whole main system. Quite a good many dollar- as shown by a loss of a cent being carried through to this point, when you get your final figure per foot of mains it only makes a triflng difference if you only take the next 1/10 of a cent and *and* either add a few 1/100s or drop them if the fraction is more or less than ½ a cent so that is done here; and the figures are opposite the word "used" in the left hand column, meaning they are the figures used in making the computation in the cost of mains. *A*t can be seen that these figures have been used by referring to exhibit "186" where those figures marked used are represented for each year as against each size of mains to compute the cost. The tabulation proving exhibit "189" that I have just explained is itself made up in a composite way of various quantities being exhibit "190" on page 15.

1200 Exhibit "190" is entitled "sizes of trenches and cost per lineal foot of trenching and filling for gas mains as of January 1, 1907," Exhibit "190" gives in detail at the left hand side the range in the size of pipes found in the Lincoln system beginning with the 1¼ inch and running up to the ancient 20 inch.

In the next column is the width of the trenches reasonably dug in the streets for the laying of such a main; which is set out in feet and tenths of a foot being more convenient to carry through the computation than in feet and inches and it is more common among engineers to figure it that way while architects and carpenters would figure it by feet and inches.

The next column headed "Feet size trench" is the feet deep that shows the depth to which I think the gas mains in Lincoln have been approximately laid, at least it shows a sufficient depth and they certainly are not deeper than this.

And the depth as to my knowledge derived from a great many basis of about the depth to which gas mains are commonly laid and is as good an estimate as I have been able to make on a fair depth on which to make a computation for the sizes of these trenches.

The feet depth as the column runs down is so increased as to allow substantially a covering of 3 feet of soil over the top of the gas mains that applies to all sizes, taking a 1¼ inch main which is hardly entitled on account of size to be called a main and the trench for it is dug 3 feet deep which gives almost a 3 foot covering as a 1¼ inch pipe wouldn't take up much vertical space in the trench. On the 2 inch the depth is 3.2 feet which allows the 2 inch pipe to be covered with substantially 3 feet of soil; and the 3 inch mains 3.3 feet; the 4 inch 3.5 feet allowing a full three foot covering and so on down the column until we get to the 20 inch there is an estimated depth of 4.7 feet for that trench; all of these depth- are to the bottom of the trench from the top of the ground if

1201 there were paving over the street that would be from the top of the paving to the bottom of the trench. My figures are sufficient to cover the laying of the mains and digging of the trench to the depth here set out below the bottom of the paving although that would be unnecessary but that is what the figures clearly cover. I mean by that if laid in a street that was paved in order to get sufficient cover I wouldn't go to those depths you would only have to go those depths minus these figures, my figures really cover these depths. It is really a small error of mine and not the figures of the gas company, if my figures for the total depth of the main *is* correct because I figured the cost of digging this deep in the plain soil and I have also figured apart from this another cost of laying under the paving to the depth that it is laid.

Exhibit "190" shows the width of the trench and the total depth of the trench in the soil for each size of main.

The multiplication of these figures together give the next column headed "cubic feet per foot" meaning the cubic feet removed from the trench for each linear foot of trench for instance, the first entry opposite the 1¼ inch size we have the feet wide 1.4 and depth 3 feet that multiplied together,—3 x 1.4 gives you 4.2 feet and multiplying that by the 1 correcponding to one linear foot of the trench gives 4.2 cubic feet and so on as to any quantity in that column. The last column in the table is the cost of removing and replacing, disposal and filling and settling the soil in these trenches; It is estimated here at 1½ cents per cubic foot as it originally lays in the trench there is 27 cubic feet to the yard and a half of 27 is 13½ so that amounts to 40½ cents a yard for dealing with that soil taken of the trench, the trenches are dug as I have indicated and run from 3 feet to 4.7 feet deep.

1202 My figures for digging the soil out of the trench and disposing of it are not radically different for digging similar holes in the ground for footings to buildings and things of that sort, which I assi*n*ged yesterday at about 40 cents. I don't think it cost any more to dig a trench down in the open gas yards than in a public street of like kind of soil and similar proportions.

That takes care of the cost of trenching filling only, the figures in the right hand column of Exhibit "190" are carried into Exhibit "189" opposite the entry of trenching and filling, and for those on the 2 inch size in Exhibit "190" we have $7.20 for that in Exhibit

"189," brought out to be added into the other cost per foot of laying the gas mains of that size. Exhibit "190" is simply the fundamental computation about the removal of the soil and the result of laying the mains. My information for making the conclusion about 1½ cents per cubic foot was the proper price for this kind of work has been arrived at from a wide range of sources, that and other labor costs compare to some extent, as I was going to show later. That labor cost as actually reported by the company as having occurred from laying those mains piecemeal from year to year, the company didn't report this labor cost for trenching and filling alone,—so in order to make a comparison with the company's cost for laying mains the other labor cost must be added to my figure for trenching and filling; and these costs for trenching and filling that I have estimated here correspond with the figures that I have from various sources and I will employ some of them in an exhibit showing just where it is from; it is a little troublesome to put them in the proper order of a tabulation and particularly approximate cost like labor cost, but I will show all of that later. My idea being to give absolutely every process that is used in arriving at those figures.

1203 Exhibit 191 page 16 of the folder is headed "cost of cast iron pipe for gas mains in Lincoln as of January 1, 1907." The exhibit takes for each size the cast iron mains from 3 to 20 inches in diameter, gives the pounds per foot that have been used in computing the cost of the mains,—I believe the pounds per foot would be more than fair to the company looking at the range of time during which those mains have been laid—and having in mind the history of gas pipe and the variations in weight that have occurred. I will explain that somewhat more fully after finishing with Exhibit "191" as to how the pounds per foot were arrived at and my reason for thinking they are ample and represent the weights of iron actually in the ground of the Lincoln gas system.

The column "pounds per foot" is followed to the right by the column "dollars per tone of 2,000 pounds," meaning here in Lincoln,—it is usually bought and sold f. o. b. cars at the point of delivery or where it is to be used, the seller usually makes his quotation to include the freight, and the way iron pipe in later years is invariably sold by the ton at the point at which the purchaser wants the pipe.

Having the weight of the pipe per foot and the cost per 2,000 pounds there is obtained by computation a cent cost per foot as shown in the next right hand column; that is a little matter of arithmetic. To those cent cost per foot is added 3% to cover the cost of the specials used in connection the pipes,—by which we mean special forms of castings such as "crosses," "T's," "L's" and various other shapes that have to be used at street intersections and other locations for joining and connecting the lengths of street pipes; to cover the specials and other iron and metal items that go into the pipe system which consist of some drips and few valves for shutting off the flow of gas in a particular portion of the pipe system, and that 3%, is

computed on the cost of the cast iron pipe on board the cars
1204 at the point of delivery, and from computation based on the actual experience for such specials, in a number of instances. I have arrived at the conclusion of 3% as a very ample charge for that purpose. I will be able to add an exhibit I think showing the actual cost of specials on very considerable lengths of pipe that have been laid in this city.

The cost for pipe and 3% for specials is shown in Exhibit "191" and carried into Exhibit "189" on page 14 and appears in just the same figures for each size, for instance, the 4 inch size, the cost of the pipe plus 3% is 28.01 cents per foot. To take another illustration the cost of the 20 inch pipe is $2.3175 per foot. And to explain the basis of the weight of pipe on which I have made these computation I call attention to Exhibit "217" on page 9 of the folder headed "Data considered," Exhibit "217" is made up for several parts, the part to which I first call attention is headed "pounds per foot standard weights cast iron gas pipe."

In general the history of cast iron gas pipe manufactured is about as follows:

Prior to about 1892 I am not aware of any standard being adop-ed for the weight of cast iron pipe by any association of gas engineers or gas managers, if there is such it has escaped my attention. Different makers varied more or less in the weights of pipes they furnished for gas purposes. It has always been the common practice to use a lighter weight of cast iron pipe for gas than for water, the rule being that among the requirements for water pipes it is required to have strength to resist internal pressure. Our water systems commonly have an internal pressure of water from 20 pounds to approximately 50 or 60 pounds per square inch, whereas the pressure in gas pipes is only a few inches of water pressure per square inch, the pressure may be run up to several pounds per square inch,
1205 but even that is very trifling to water pressure. So that in the water pipes we have considerable internal pressure as bearing on the strength of the pipes, whereas ordinarily in low pressure gas works the internal pressure has nothing to do with the strength requirements of the pipe. What we want is a pipe that will resist the external forces that might tend to crush or crack it,—a pipe that will resist for a good length of time the corrosive action of the soil and elements. And managers of gas plants thought there was no occasion for having such heavy cast iron pipes as are used in water systems. About 1892 as I remember the Western Gas Association an association formed of gas manager and engineers adopted a resolution recommending that gas pipe of a certain size be made of a certain weight per foot, that is all such an association can do, it can't force any manufacture- to make pipe of a certain weight and can't force any gas company to purchase it, but such a recommendation would have much weight with gas engineers. In 1898 the American Gas Light Association, at that time the largest and most influencial association in the country adopted a resolution as to the weight of gas pipe very close to that adop-ed by the Western Gas Association in 1892, and in Exhibit "217" under the heading of

"pounds per foot standard weights cast iron gas pipe" I commence with the left hand column and set out the weights of pipe that was recommended by the American Gas Light Association and its members to have used by gas companies in the year 1898. These pounds being pounds per foot and are as follows: for 3 inch pipe 11 pounds; 4 inch pipe 17.33 pounds; 6 inch pipe 25.5 pounds; 8 inch pipe 39.25 pounds; 10 inch pipe 56.1 pounds; 12 inch pipe 75.4 pounds; 16 inch pipe 110.5 pounds; 20 inch pipe 166.5 pounds;

The next column in the table gives the weights of so called standard cast iron pipe set out in the 1901 catalogue of R. D. Wood & Company of Philadelphia, one of the older makers, if not the oldest, of cast iron pipe in this country and a large and prominent
1206 makers of such pipes. The weights set out in the catalogue of R. D. Wood & Company run on almost every size somewhat below those recommended by the American Gas Light Association in 1898.

The next right hand column gives the pounds of standard cast iron pipe per foot as manufactured by the Addyston Pipe Company, more correctly termed the Addyston Pipe & Steel Co., of Cincinnati. These weights are set out in Kent's Mechanical Engineers Pocketbook was printed in 1895. Kent's Pocketbook is one well known by engineers as a reliable authority and when quoting figures from some source gives the source from which it takes the figures. Kent's Pocketbook for 1895 gives the weights on standard gas pipe as made by the Addyston Pipe & Steel Company at that time and those weights are here given in the column corresponding to each size, for instances, the weight of the 4 inch is 17.4 pounds; 6 inch 30 pounds 10 inch 50 pounds; and so on down through the column as there indicated. These weights set out in Kent's Pocketbook as credited to the Addyston Pipe & Steel Company have a particular interest in connection with the proper weights of cast iron that the Lincoln Gas Company has in the ground, and that fact is shown by the statements of the factory in the case of the Addyston Pipe & Steel Company vs. United States reported in the 175 U. S. 211 and extracts therefrom stating certain facts as to the Addyston Pipe & Steel Company are here made a part of Exhibit "217."

It appears in that case that the Addyston Pipe & Steel Company of Cincinnati, Ohio, Dennis Long & Co. of Louisville, Ky., Howard, Harrison Iron Company of Bessimier, Ala.; The Anniston Pipe & Foundry Company of Anniston, Ala.; the South Pittsburg Pipe Works of South Pittsburg, Tenn.; the Chattanooga Pipe Works of Chattanooga, Tenn.; one company in the State of Ohio, one in Kentucky, two in Alabama, and two in Tennessee entered into a combination about the price of cast iron pipe and were prosecuted under
1207 the Sherman act so called and so that got into the case a statement about these companies. As I understand it Addyston Pipe & Steel Company was really the leader and got up the printed matter relative to the price quotations that showe- what was being done and one of these list- of standard gas pipes as furnished by one or more of these companies got into the Kent's Pocketbook for 1895.

The following are in substance some of the facts on which the judgment of the Circuit Court of Appeals rested as stated in the records: "It was charged in the petition that on the 28th day of December 1894 the defendants entered into a combination and conspiracy among themselves, by which they agreed there should be no competition between them in any of the states and territories mentioned in the agreement (comprising some 36 in all) in regard to the manufacturing and sale of cast iron pipe.

From the minutes of the association a copy of which was put in evidence by the petitioners, *a*t appeared that prior to December 28, 1894 The Anniston Company, the Howard Harrison Company, the Chattanooga Company, and the South Pittsburg Company had been associated as the Southern Associated Pipe Works and upon that date the Addyston Company and *the* Dennis Long & Company were admitted to membership. The contract was let to Howard Harrison Company at Bessemier the $24.00, who allowed the Shickle, Harrison and Howard Company,—a pipe company of St. Louis not in the association, but having the same president as the Howard, Harrison Company at Bessemier to fill part of the order." This extract, part of which I have read from the Surpreme Court case, I think tends strongly to show that this group of pipe manufacturers were doing business together in this combination, and to my mind that they would be furnishing the same weights of pipe for the same price. It happens that the names of several of these companies which I have just read from Justice Peckham's statement
1208 appear repeatedly in the records of the Lincoln Gas Company as the company from whom they purchased their pipe as I will show by another exhibit. I was trying to indicate my reason for thinking the Lincoln Company bought this grade of pipe which was more largely this than weight I have allowed, and part of that reason is if they were buying pipe from those parties,—the leading member of that combination put out that weight of pipe at that time,—according to Kent and his Pocketbook.

My general view and information about the situation as to the weight of cast iron pipe, that prior to 1900, and particularly prior to the adopting by the American Gas Light Association in 1898 and the Western Gas Association in 1892 of standard wieghts for pipe is the weights were lighter than those adopted by those associations, otherwise I don't think there would have been any association to adopt and recommend. The tendency has always been in the associations to recommend a somewhat higher standard than that in use and to raise the general standard of con-truction, it is impossible that the associations would have adopted and recommended a lighter weight than that in use.

For the purpose of connecting the figures in Kent's Pocketbook with the weight of pipe here in Lincoln I call attention to exhibit "212" on page 9 of the "Cost exhibits folder." Page 9 contains simply the summary of figures representing the dollars of worth of pipe purchased in this as far as I could ascertain. Turning to page 10 exhibit "212" that exhibit shows, "amounts paid for cast iron pipe per books and bills."

In the exhibit in the left hand column is set out the names of divers pipe manufacturers know- to the trade as such and then follows designating all the dates by year at least and in some instances by the month and day, and then the price per ton obtained and the total cost of the pipe purchased in dollars.

1209 The names of the pipe manufacturers, under each year, in the early years appears in the book of the accounts of the company,—the ledgers and journals,—and in the later years all the bills we have been able to procure, it has been impossible to find any bills prior to 1901 but there are numerous entries in the construction account of the Lincoln Gas & Electric Light Company purporting to show purchases from these pipe manufacturers, in most cases there is enough in the entry to indicate that it was pipe,—where the entry was simply the name of the pipe manufacturer and dollars I have assumed that it was pipe. I am speaking of the pipe manufacturers whose name- appear in this list of vendors of pipe beginning in 1876 when the wooden mains gave out and run down through to 1912. That is the list I presume from whome a great portion of the cast iron pipe has been bought.

In the year 1880 appears the name of Taylor Jones and an amount of about $4,100.00,—I think that Taylor Jones was the maker and seller of cast iron pipe,—if I am wrong the entry against Taylor Jones in the year 1880 goes for nought.

In 1876 there was purchased, according to the books of the company, from Dennis Long & Company, one of the concerns that got into this difficulty with the United States $1,397.00 worth of pipe.

In 1884 we notice the name of Shickle Harrison & Howard Company,—there were two of those Harrison companies you will remember which have the same president and may be presumed to have conducted their affairs in the same way as to weights of pipes. Running down through the 80's the name of Harrison, Howard Company and Shickle, Harrison & Howard, Dennis Long & Company and the Chattanooga Pipe Company appear regularly. In fact they appear to include most all of the purchases of pipe that were made. Then I find the Lake Short Foundry in there for a purchase in 1884, but most of the purchases were from the concerns I

1210 have mentioned and the same thing appears right down into the 90's running down throught the years are found Dennis Long & Company; and Shickle Harrison & Howard occupying a very large space in the pipe purchase. In 1890 Dennis Long and Company there selling this concern some $8,314.00 of Pipe. In 1891 Shickle Harrison & Howard appear to have sold this company some $14,110.00 worth of pipe and it is not until we get down to the year 1901, and in later years than when the bulk of this cast iron pipe was purchased from this company.

Having shown from whom the bulk of this cast iron was purchased as indicated in exhibit "212" I now call attention to exhibit "210." Exhibit "210" shows the weights and length and weights per foot of cast iron pipe purchased by the gas company. This exhibit includes all the pipe purchased that we have been able to find in the books of the Lincoln Gas Company, and in their bills

beginning with their earli-st year down to the end of 1912, and a couple of bills in 1913 and we probably have in another all that has been bought in 1913. Exhibit "210" is not merely co-extensive with exhibit "212" which runs from 1876 down to date, whereas there is in exhibit "210" only one item that runs prior to 1901,—that entry is for 1892 and is found at the bottom of the exhibit,—that is due to the fact that the bills of the company have disappeared to 1900, you can't find them and the book entries are very meager showing usually the name of the concern from which the pipe was purchased and the weight of it and not giving the length per pound purchased so you can't determine the weight per pound.

I believe exhibit "210" shows a materially heavier weight of pipe on the average than the company has actually bought and put into the ground, because it covers purchases of pipe since 1900, with one bare exception and since 1900 a heavier weight of pipe on the whole has been in vogue due to the activity of the different gas asso-
1211 ci-tions than existed on the average before that.

In exhibit "210" there is shown the date of each purchase and — recoeded, the number of pieces purchased and the inch size. As to the word "pieces" it is piling pipe, very common to speak of an individual as a piece of pipe as now and has been laid in standard lengths of 12 feet; when you come to put them together they actually cover some more than 12 feet because they have a bell and socket joint so there are less of the length when it comes to connection them up and they are always dealt with on the basis of their laying length, so if you know the parts or pieces of pipes purchased you know the laying length and then all there is to do is to multiply it by 12, and that is how these lengths in most cases were obtained. The bills don't commonly state the length of the pipe in feet, they state the number of pieces and the amount paid per pound and the conclusion as to the length inevitably follows due to the fact that standard gas pipe is now 12 feet. Having the actual pieces of pipe per foot the entire length here, the weight would be a little less than here because your pipe would be 6 inches longer and you would have a greater factor to divide by, the pounds being fixed the weight per foot would be a little less.

There is given in exhibit "210" the number of pieces and inch size; the pounds total weight; the feet leng*ht* and the pound per foot resulting from the total number of pounds purchased and the feet in length. The purchase of the respective sizes of pipe have been combined to get an average figure for each size of pipe; for instance, here are recorded all the purchases we have found on the 4 inch cast iron pipe beginning with 1901 and ending with 1913 and the total weight of that 4 inch pipe is added together in one of the column- headed "pounds total weight" and the total feet of that 4 inch pipe is obtained by adding together the feet in these
1212 respective purchases, and the total pounds is divided by the total feet to get the average of 18.8 pounds per foot for the pipe of that period. I didn't expect to find and didn't find the lighter weight of pipe I believe exists in this plant because this record don't go back far enough, but I have put down here light or

heavy what I have found. These figures deal with more recent purchases since 1901, except one, that I will call attention to later.

For the 6 inch pipe the purchases ran from 1901 to 1910, and the total weight is obtained and the total feet of length for an average weight of 31.4 pounds per foot on the basis of these purchases and weights.

For the 10 inch*e* pipe I have only one small purchase which shows 55.8 pounds per foot; that purchase is dated 1910 when I should have ex*ep*cted the current weight of gas pipe to have been purchased.

For the 12 inch I was unable to find only a single length where I could get the weight that figures at 70.4 pounds per foot purchased in 1912.

The 16 inch pipe, the last entry in this exhibit "210," I got one of the purchases of the early pipe which I think would have been a light weight, and found 33 pieces of 16 inch pipe in the record as bought, and weighing 37,137 pounds; the length of those 33 pieces would be the laying length of 396 feet, resulting in 93.7 pounds per foot, a weight substantially less than that I have assumed for the weight of the company's pipe.

Again referring to exhibit "212" at page 11 I call attention to the date and parties concerned in that purchase of 16 inch pipe, which is the only purchase of cast iron pipe.

Going into the pounds and length that we have been able to locate in all the records of the company. Looking at the year 1892 we find the Western Gas Construction Company and seller of that pipe

1213 bought August 11th, the size was 16 inches, the pipe per ton $26.25, the total cost was $487.33; that is the only one that gives the length and weight of the cast iron pipe purchased prior to 1900 and occurrs in Ledger "B" at page 134 where the whole transaction to the extent to which I have indicated is set out.

Now referring to exhibit "217" on page 9 of the folder entitled "Data Considered" and to the right hand column entitled "Pounds per foot standard weight of cast iron gas pipe" that column is headed "Pounds per American Gas Light Association in 1905" and call attention to the fact that the pounds as set out in that column and adopted by the gas light association in 1905 are larger than the 3 usually used sizes of 4, 6, and 8 inch than the weights adopted by the same gas light association in 1898; and substantially larger than the weights shown in the catalogue of R. D. Wood & Co. and are larger in the majority of sizes than the weights shown in Kent's Pocketbook and there described as the Addyston Pipe & Steel Company pipe.

A comparison of the weights set out in these two gas li*hgt* association recommendations illustrates the movement I mentioned toward the use of a heavier weight of pipe, one recommendation being in 1898 and the later one in 1905.

Before leaving this subject of the weight of pipes, a somewhat important one, I call attention again to exhibit "217" page 9 of the folder "Data Considered" that table is headed "pounds per foot of iron gas mains" and included the inch sizes of mains from 3 to

20; the pounds per foot assumed by Mr. Lea as the weight of the gas pipe actually in the ground here in Lincoln in his valuation.

In the next column the weights assumed by Campen another witness for the company. The next column shows the weights assumed by myself in my testimony, which are the weights shown in Kent's Pocketboo*t* described as the Addyston Pipe & Steel Company who was in the combination with the other compan*y*'s mentioned and three names appear year after year from 1876 to
1214 1900 on the books of the Gas Company as the sellers of pipe.

I don't want to be understood as saying those compan*y*'s before the time of that combination, made a pipe as heavy as I allowed, but I wanted to make a fair conservative estimate as to the weight of the pipe on beh*l*af of the Gas Company and feel sure I have erred as against the City in assuming the weight of pipes that I have. I have assumed a greate*d* weight that actually exists on the average here in Lincoln undoubtedly the small amount they have bought in recent years is heavier per foot than the weights I have taken there is only a little of that heavy pipe, the great bulk of that pipe was bought before my record of the weights of same are shown,—was bought at a time when the records of the company wouldn't show the weights,—with the exception of that one instance of pipe in 1892. You will notice that Mr. Lea assumes 110.47 pounds per foot for the 16 inch pipe; and Mr. Campen found it was 108.3 pounds per foot and I have assumed 100. pounds per foot as the weight of that 16 inch pipe; and the only record of the company on that size of pipe shows a weight of 93.7 pounds per foot,—this is also the only record of the company that we have back of 1900 being the record of 1892,—I think I have dealt with it fairly with the company in assuming that all the other cast iron pipe on the average has a weight as great as that shown in Kent's Pocketboo*t*.

Now another thing about the designation of steel mains apart from cast iron pipe. In exhibit "187" on page 12 headed "Cost of steel mains laid each year as of January 1, 1907," the pipe now very commonly laid by gas companies is what is known as "black" or "merchants" pipe; it is a soft steel pipe that has mostly replaced wrought iri*o*n in the market because it is cheaper to manufacture and many engineers think it is as good as wrought iron, at least one manufacturer has put out a pamphlet in which he thinks it is better than wrought i*o*rn, it is largely used and in looking through the rec*o*rds of this company I have run across scarcely any
1215 if any bill that specifies genuine wrought iron pipe which is the way that wrought iron pipe must be designated in order to get it.

The point about wrought iron pipe that I have in mind in this connection is simply that if we had to estimate the reproduction of wrought iron pipe here in Lincoln on the basis of wrought iron it would be necessary to add 1 cent or more per foot, perhaps 2 cents to the price of steel pipe in order to get a fair price of wrought iron pipe; but finding the bills of the company showing regularly black pipe, and finding the entry in one of the company's record books

of steel pipe purchased I don't think any great amount, if any, of the pipe in the ground is of the genuine wrought iron I think it is of the black steel pipe sort which is cheaper than wrought iron and I have made my estimate on that sort of pipe. I so understand Mr. Lea to assume the steel pipe in his testimony and presume his price is for steel pipe. That has a bearing in this case here whether we shall charge several cents more per foot for this wrought iron pipe. Both the steel and wrought iron are commonly spoken of as wrought pipe, that is, they are not a pipe obtained by a casting process at all, but are obtained by a mechanical manipulation of the iron formed into a shape by suitable machinery and they have very similar characteristics. The steel pipe used to be a good deal harder when you tried to work your dies when cutting threads so you could tell that way, but now the manufacture of it has been so improved that I can't tell and those that work in it can't tell whether it is wrought iron or steel pipe. There is a minute structural difference, a structural rather than chemical although there is a slight chemical difference; the more accurate way to tell whether it is wrought iron or steel is by a certain test that brings out its structure. There is a small layer of slag between the layers of iron in the wrought iron pipe that doesn't exist in the steel pipe. You don't get the slag out of the wrought iron that you do out of the steel, it is not there, you can *you can* find it out by proper
1216 methods.

The cost of steel pipe as set up in exhibit "187" is separated into the cost for the respective years in which the pipe was laid in the same way as the cost of the cast iron pipe as shown by the records of the company. The cost per foot of steel pipe is multiplied into the number of feet of the particular size of steel pipe laid in the year to get the total cost of the pipe laid in each year.

The only size of steel pipe laid as mains by the company beginning with 1903 has been the 2 inch size, so that we simply have to apply the estimated cost of 2 inch pipe laid complete in the ground to the feet of 2 inch that has been laid in each year. A large quantity of 2 inch pipe was also laid before 1903 that is estimated in the same way by applying the same price per foot here adopted for the 2 inch pipe which is .098 cents for the pipe and main laid in the ground complete as of January 1, 1907. That gives in connection with a little 1¼ and 1½ inch pipe that is said to have existed prior to 1903, a cost for the steel pipe laid before 1903, of $26,338.39; and then following down through the years to 1906 inclusive, the total footing of the column of cost is $39,709.50 for all the steel pipe l*iad* up to January 1, 1907.

Exhibit "188" page 13 the second tabulation is headed "Cost and value Lincoln steel gas mains as of January 1, 1907."

This table sets out the cost of steel pipe on the basis of 1907 price for each year in which the pipe was laid, as indicated in exhibit "187" which carries those early totals for pipe laid into exhibit "188" where they are again set out under the heading "New cost January 1, 1907."

Next comes the column of "years old" indicating the age of the pipe.

Next the column of depreciation, which is figured at 2%
1217 corresponding to a life of 50 years for this class of pipe as distinguished from 100 years which was allowed for the cast iron pipe. The steel pipe has a much thinner wall than the cast iron pipe consequently at a given rate of corrosion per year it would last less if the corrosion were on it at the same rate and you would have a hole in the pipe in that the metal or steel corrodes at a faster rate, you can rust away more inches per century exposed to the soil than you can cast iron and 50 years is as good an estimate as I can make for the life of that pipe which results in a 2% depreciation.

The dollars of depreciation are computed by multiplying the percentage of depreciation into the cost of the pipe as laid in any one year to get the dollars in the column of depreciation.

And the column of dollars value at the right is obtained by deducting the depreciation from the cost of the pipe.

The footing of this column for the new cost of steel pipe is $39,704.00. That is the same footing figure carried by me into exhibit "184" as the cost of the steel pipe. And the footing for the total depreciation on this pipe down to January 1, 1907, is $9,354.00 which deducted from rest leaves a value of January 1, 1907 of $30,350.00 which is again carried into exhibit "184" under the heading "distribution system" on page 8.

Calling attention to exhibit "189" on page 14 how the cost of steel mains, made up of steel pipe, labor and materials to place in the ground is made up. The steel mains in Lincoln are composed of a small amount of 1¼ inch pipe and then of 2 inch pipe, almost all of the 2 inch size, and in showing that I will confine myself to the 2 inch size because the 1¼ follows it in form. The trenching and filling for the 2 inch steel pipe is 7.20 cents per foot; the carting and laying of that pipe is 1.80 cents per foot. It may be explained here that the laying of the steel pipe and particularly
1218 the joining of it is a shorter and cheaper process than that of cast iron. Steel pipe commonly comes in random lengths about 12 to 18 feet,—16 feet is a common length,—it is joined by screwing it together, it is a screw pipe. Those screw joints can be made very quickly and much cheaper than the cast iron joint between it.

Cast iron pipe joint which is commonly made of cement and what we call yarn or oakum hammered into place. They used to use lead, lead is still used in water works, but in the gas works the joint is usually made of cement. The joint *are* made by hammering this yarn and filling it up with a cement mortar that makes a tighter joint and one that gas managers prefer. Some lead joints are put where it is thought the pipe will be subjected to unusual strains, that is, a brittle joint, whereas the lead joints are made to give it strength. That gives the total labor of trenching and filling carting and laying of the 2 inch steel pipe of 9 cents per foot and there is added another ½ cent for miscellaneous material called

here "jointing materials and incidentals" the only join-ing materials would be a little red lead to put on the screw joints for each pipe coupling is screwed into the next pipe adding that general incidental expense of ½ cent to the 9 cents makes 9½ cents per foot for the steel pipe all except the iron. In dealing with the iron I have put in here 10.34 cents which is 3% on to the cost for the specials for the 2 inch size. That is 10.34 cents for the 2 inch size and specials added to the 9.5 cents cost makes the total cost read 19.84 cent- and there has been used in the computation the nearest 1.10 of a cent, namely 19.8 cents as the total and complete cost of acquiring the pipe into position and ready to supply gas in the trench, being done with the job everything except paving.

I want to say a word about my method of arriving at the cost of steel pipe, as such and cast iron pipe, also a word or two about the labor cost of the pipe, that is of laying the pipe and getting it into a main system.

1219 I call attention to exhibit "191" on page 16 of the valuation folder in a column of that exhibit is set down the price per ton which I have used for the several sizes of cast iron pipe.

Exhibit "191" is headed "Cost of cast iron pipe for gas mains at Lincoln as of January 1, 1907"; I am now attempting to explain the rule for adopting the price of 2,000 pounds per ton set out in this exhibit as follows; for the 3 inch mains $34.00 per ton; these prices are all f. o. b. Lincoln. 4 inch mains $32.00 per ton; and 6 inch to 20 inch mains inclusive $30.00 per ton. If we were trying to strike an extremely fine division of the cost we would differentiate a little between the cost of the 6 and 8 inch mains to the 16 and 20 inch mains, but I have thought these prices very fair to the company taken and applied as they are.

Explaining about the sources of information for the cost of cast iron pipe, in the first place cast iron pipe is sold in a pretty uniform way; the freight is usually prepaid by the seller of the pipe to the point where the purchaser wants to have it delivered, so that notices and contracts for cast iron pipe are almost invariably on the basis f. o. b. some point and the freight paid to that point by the person who furnishes that pipe.

The Trade Journals, a number of them, particularly the Iron Age, and the Engineer's New- have long compiled with what we call the open market quotations on cast iron pipe, which compiled records of the letting of cast iron pipe, in public bids, particularly by cities; that comes about in this way; in the first place the Journals have gotton into the habit along with the manufacturers of cast iron pipe of giving out quotations or what are called open market quotations on a mediate size of pipe, either 4 or 6 inch pipe f. o. b. for certain important points. For instance, you get weekly notices f. o. b. Tidewater, N. Y.; you will probably get a notice f. o. b. Chicago; and several other important freight centers. You will get notices

1220 on 4 and 6 inch pipe based on the purchase of one car load as so much for 6 inch pipe f. o. b. Chicago;—or whichever point it may be,—there are perhaps 4 or 5 of those point- at which quotations are commonly given in the Trade Journals. That infor-

mation is important as indicating the general swing of the market of cast iron pipe. It is not exactly uniform as to price at which you can buy if you wanted a good quantity of it, but if you merely wanted to buy a car load of pipe you can get closer to what you will have to pay by looking up the market quotations. If you want a good many cars, such as would be concerned in the construction of the Lincoln Gas system it is a very different matter. The buyer at wholesale gets a better price than the open market quotation published broadcast per car load of pipe. If you really wanted to find out what the pipe can be bought for in considerable quantities the thing for you to study in addition to the market quotations, which are always net cost and are helpful to giving an idea of which way the pendulum is swinging; is the record of actual sales of pipe are public bids made usually to cities. The municipal ownership of water works in this country is very extensive, the percentage of municipal ownership as applied to water are many time- as are applied to gas and even electric plants so that a great many municipalities are buying pipe from time to time and municipalities conceal their business you can always find out from a municipality what the price of pipe is that they have paid for it. Usually the municipality will advertise in the Engineering News that bids will be received on a certain date and are for so many tons of cast iron pipe. Anybody can go to the proper city official and find out about it. Trade Journals recognize that is valuable to engineers the country over collect and publish it and be comparing those bids of cast iron pipe who have the actual transaction. Bids are sometimes accepted and sometimes rejected but it represents the actual offer to sell and you will find those bids and contracts for cast iron pipe contain in that way always running
1221 distinctly below the market quotations for single car loads as published in Trade Journals.

I have relied very largely on those bid- and contracts for cast iron pipe as delivered to certain cities in this part of the Union, meaning the whole Mississippi Valley ranging through this part of the country.

To allow a far price on this pipe,—not here in Lincoln because the purchases of this company of this cast iron pipe at about 1906 and 1907 were very small so their purchases are not a fair criterion of what it would be paid per ton for cast iron pipe but would have been paid if the purchases had been large in quantity, like that to reproduce this system of gas mains here. The same is true of the Lincoln Water Works. Their purchases of pipe have been made piecemeal, to extend a main here and there, that is during the years 1906 and 1907, the years when we wanted to look for information as to what could have been done in the purchasing of pipe for the duplication of this gas system. The purchases regularly by the water department of this city are small and are not an adequate measure of the pipe at that time, they are too high. I collected quite an amount of information from the Trade Journals as to bids and contracts for cast iron pipe, made all the way from Minneapolis to New Orleans along both sides of the river to get a good representative basis. So that you can see just how the actual prices paid by the purchaser in

quantities compared with the $30.00 per tone I have allowed for everything in 6 inch size and larger, and $32.00 per tone on the 4 inch,—now a word as to prices of steel pipes. Steel pipe unlike cast iron pipe is more commonly sold f. o. b. the point of shipment. It is not sold by weight but by the foot. If you want to got through a process of mathematical gymnastics you can tell what you are paying per pound and it may be interesting for some purposes; it is sold from what is commonly called standard pipe lists. We had
1222 some of those lists introduced in evidence by the company. There is issued from time to time by the manufacturers a discount from those list-,—the list- themselves are not changed very often. There was a list in 1901, and speaking from memory, I think only one important change was made on any size of pipe used by this company between then and 1910. The discounts change frequently,—from week to week, or month to month,—it fluctuates with the price of steel products.

The most common and general quotation is for pipe f. o. b. in what is known as Pittsburg District. Most of the steel pipe is made in or adjacent to that district, which I understand to be a large territory in Pennsylvania *hw*ere many of the mills are located as to which the freight is equalized it don't make any difference whether the mill is northeast or southwest of Pittsburg. I think some of these plants even farther away are equalized and brought to the same basis as the Pittsburg District, but am not quite sure about that.

Unless you make a special contract for steel pipe you get your quotation f. o. b. Pittsburg you have to find out your freight rate to the point of shipment to find what it is going to cost you. Of course this plant has from time to time bought from the local supply house small quantities of pipe but it will be ruinous if you were building a plant to do that, I haven't considered that as of any particular value or indication of the fair price of pipe to be figured in reproducing this plant. I have thought rather that the price to be considered and used was what the pipe would cost f. o. b. Pittsburg plus the *g*reight *of* bring it to Lincoln. I have a letter stating the freight rate from Lincoln to Pittsburg on steel pipe and have figured my steel pipe on that basis and will show the details of that in an exhibit, showing the cost of pipe apart from the market quotation, in the Pittsburg District and the cost that must be added to cover the freight for bringing it here to Lincoln.

I also have some other cost of steel pipe here that have
1223 been purchased of particular companies in considerable quantities which I will put into the exhibit.

I haven't the bills for small quantities of steel pipe purchased by this company locally here giving particular indication of the actual cost of pipe if bought in large quantities such as would be necessary to replace this plant. I think however, that some of the bills of the gas company show as low a price as I have used in particular around January 1, 1913. When it comes to that valuation I think some of the purchases of pipes where they purchased a fair quantity say 2 or 3 miles, was about as low as I figured. I don't think I figured the

lowest price it could have been bought for but a price it could easily have been laid here for.

I call attention to the total ton-age of cast iron pipe in the Lincoln Gas Plant as of January 1, 1913 in Lincoln, it does not include the cast iron pipes outside of the city. These figures are for January 1, 1913 I mention here for I have none compiled for January 1, 1907. That wouldn't be greater than this because the amount of cast iron pipe since 1907 has been quite small relatively, I find taking it down to 1913, this plant contained on the basis of the evidence I have used, 1,828 tons of cast iron pipe. If you want to put it into pounds it is 3,675,653 pounds, which would make quite a pipe order and would have that bearing on the price that I have indicated the wholesale purchase usually has.

Now a word as to the cost of labor of installing the pipe here in Lncoln, referring to exhibit "212" on page 12 of the cost exhibit near the bottom of the page. If you will look at the years 1905 and 1906 you will see all of the purchases of pipe as of those dates that I have been able to find, which was very small, and in my opinion quite inadequate to base directly a fair price on.

In 1907 my recollection is that I was unable to find any purchase by the company in that year.

1224 The price paid in 1906 for some 4 & 6, inch pipe ranged from $30.60 to $32.35 per ton whereas I have allowed in Exhibit "191" for 4 inch $32.00 per ton and for 6 inch and larger $30.00 per ton of the price I have taken for pipe is somewhat lower than this price of 1906. A word in explanation the way that the price of pipe, as exhibited by the market quotations and actual sales of pipe ought to affect the company on the new cost of that pipe in the duplication of this plant as of January 1, 1907, I take then that the substantial purchaser of this plant,—the person into whose mind we are trying to see what the aggregation of things here forming the gas plant would be worth at that time, the first day of January 1907,—ready to purchase this plant must in the case of supplying like pipe which varies from month to month in price, I must look over the past year to see how the cost of pipe has been running and what the city and company have bought large bills for and take into consideration the present market price on the first of January and make the best forecast I can as to how I had better arrange for pipe purchases during the installation of the prospective gas plant, if he find he can not deal with the company by this one. As a practical man he is going to know that the first day of January people don't ordinarily put in pipe systems; he is going to come to the conclusion that the year 1907 will enable him to lay that pipe but he has no occasion for it the first day of January or February, in fact it wouldn't be at all until long in March. He is going to study the fluctuation in a past market and for-cast if he can what the price will be, and whether he had better make his contract immediately or the first of January or wait until the first of March and April because he is going to lay his pipe in the spring, summer and fall and not the dead of winter. By following out the history

of pipe price on the first day of January we know the price
1225 was a little high,—the price of the pipe curve run up into a real Pike's Peak the first part of January when nobody is buying pipe for delivery at that time. No considerable amount was being bought for delivery at that time because people don't lay pipe when the ground is 4 feet deep covered with snow. It is rather laborious as Mr. Campen found in his estimate. So the price of pipe runs up sharply in the last months of 1906 and having been a good deal lower on the average through 1906 than in the last days of December 1906 and the first days of January 1907 the reasonable purchaser in my opinion would have made his plans on the price of another swing of the pendulum, would have considered whether and how far the prices were going to fall before and during the time he would be laying that cast iron pipe. A reasonable man would not have closed up all his pipe contracts the first of January. If he had studied the curve and understands the way the pipe prices has varied and been varying during 1906, he wouldn't have made a contract for 1828 tons in the early days of January 1907, but would have held off knowing that he didn't need it to lay until along in the later part of March anywhere and would have held off to see what would happen with the market.

While we make this valuation as of January 1, 1907, that don't mean the plant has to be produced on that date one year would be ample for the reproduction of a plant like that one here in Lincoln I think the evidence of the company's witnesses applies a much longer period. If that is correct, by the same testimony much less would the prospective owner be justified in contracting for the entire amount of pipe over the year price on the first day of January, and in the middle of the year he could have bought decidedly below the price I have indicated.

I have found the testimony of Mr. George L. Campen of this company on labor cost interesting and I have compiled some of it and its analysis is shown in Exhibit "204" page 1 of the cost folder. If
I really understand Mr. Campen's testimony of assuming that
1226 anybody laying pipes can lay right on through the winter months the same as July smashing down through whatever feet of frost there was and laying the pipes as in summer. That appeared to me as extra-ordinary. I understood Mr. Campen to divide his cost for laying pipe in order I called in 10 months of the year and then at a cost quite different for piped laid 2 months a year and in Exhibit "204" I have set out his cost in detail as I understand his testimony for just the labor in laying the pipes during 10 months of the year, being that part of the year necessary to lay all the pipe there was in Lincoln and that any gas plant would consider laying any considerable amount of pipe in, of course it would call for the laying of some pipes through 3 or 4 feet of frozen earth and that was very unusual and limited in extent.

Mr. Campen made his estimate on the basis of 100 feet of pipe for each size so we simple have to move the decimal point two places to the left to get the price per foot of pipe for comparitive purposes.

The cost set down there — simply labor cost as I understand it from Mr. Campen's testimony.

Taking the 2 inch size in Exhibit "204" which is headed "labor cost of laying gas mains in Lincoln per analysis of testimony of George L. Campen in Lincoln Gas & Electric Light Company vs. Lincoln Record Age—"

I will state the items that have gone into Mr. Campen's cost of laying each size of pipe per 100 feet; hauling pipe at $1.00 per ton 0.18; foreman 0.66 laying pipe and digging bell holes 0.625 total on pipe and foreman 1.465; digging ditch 10 months in the year 4.50 backfilling 10 months in year 2.0 total on ditch 6.50 making total labor cost per 100 feet 7.96.

On the 2 inch pipe Mr. Campen's report gives the cost during 10 months of the year made up as I explained .0796 cents per foot.

My total on the steel pipe allowed for mains as appears in Exhibit "189" page 14 is 9 cents or something more than 1 cent
1227 higher than Mr. Campen's taking for 10 months in the year cost.

Taking the 3 inch pipe for 100 feet is .094 cents per foot; my figures for the same are .0992 cents per foot.

On the 4 inch Mr. Campen's figure for labor cost is .109 cents per foot and my figure is .1127 cents per foot.

On the 6 inch Mr. Campen's labor cost is .1477 cents per foot, my figure is .1488 cents per foot.

On the 8 inch size Mr. Campen's total labor cost is .1705 cents per foot; mine is .1911 cents per foot.

On the 10 inch size Mr. Campen's total labor cost is .2187 cents per foot and mine is .22 cents per foot.

On the 12 inch size Mr. Campen's total labor cost is .2695 cents per foot; mine is .2786 cents per foot.

On the 16 inch size Mr. Campen's total labor cost is .3634 cents per foot; mine is .3584 cents per foot.

On the 20 inch size Mr. Campen's total cost is .4629 cents per foot; mine is .493 cents per foot.

Calling attention further to the labor cost of the company in putting in these mains as per its annual gas reports, that cost will be found in Exhibit "205" on pages 3 and 4 of the cost folder. This exhibit is headed "Lincoln Gas & Electric Light Company, cost of mains laid 1903 to 1912 per annual gas reports." That exhibit is in the form of a tabulation covering the 10 years from 1903 to 1912 inclusive for the size of mains beginning with the 2 inch and then taking up the 4, 6, and 8 inch mains, those being all the sizes of mains the company shows in their reports as having been laid during this decade. By that process there is obtained at first a summary of the total labor cost of laying that main according to the company; the total material cost, which are not in particular concerned with here; and the resulting total cost; and the total feet of mains laid in each size during those 10 years.

1228 These mains were laid in relative small quantities during each year and it is not expected that any such average cost would result as might be had by making one job of it. Not only

these mains, but all the mains the company has got must be laid as rapidly as they could be in the reproduction of a plant the size of this one; at the same time they afford some interesting figures as to cost.

In the later part of page 4 of Exhibit "205" the summary is presented for the different sizes of mains representing the total amount laid of each size during the entire 10 years as a unit; the cost is still divided into the labor cost and the material cost, the total labor cost of laying the 281,076 feet of gas mains during that period was $33,123.70 and the total cost of the laying of said mains and furnishing the total of the mains in the ground according to the gas reports was $77,519.13, for all the sizes from 2 inch to 8 inch which the company laid during the decade.

In the last table on page 4 the cost charges mentioned are reduced to — cents per foot of mains laid with the following result as to labor: The 2 inch size .0968 cents per foot, that may be compared with my 9 cents per foot allowed for laying in the street mains in the plant. I am now making a study of the work orders to determine in part whether that figure contains any paving the company may have taken up and relaid under the instruction of the engineer. I will say that the figures I have mentioned purport to include all those found in the gas reports of all the labor expenses incurred in laying those mains. I don't mean from that to say that such charges as engineers' charges for the designing of those mains is included, but I take it that the gas reports do purport to show the total labor cost, what is the ordinary correct labor cost including that of the foreman in laying those mains.

If there was any additional cost for paving there is nothing
1229 in the annual gas reports to indicate that, I can find nothing and have looked with considerable care.

I want to have it noted that 24,458 feet of these 2 inch mains was laid; it is to be expected, therefore, if my estimates are fair and reasonable for labor, th-t the cost of the company on that large amount of mains, while not as low as my estimate of a systematic reproduction of the mains in town, still it would be getting down towards my cost and did because this labor cost is .0968 cents per foot and mine is 9 cents per foot.

Of the 4, 6, and 8 inch mains relatively very moderate quantities were laid; we find the 4 inch cost running up considerable beyond the cost I have estimated for all the 4 inch in the plant, the 4 inch labor cost is .1834 cents per foot as shown in the gas reports of the company; whereas my cost per foot of 4 inch main is .1127 cents.

The 6 inch cost per foot as shown in the gas reports of the company for this 10 year period, they only had 5,422 feet of 6 inch the cost for that is .1912 cents per feet; I have allowed .1488 cents per foot for the entire length of 6 inch mains in the ground which is again just what I should expect as I found the company had been laying a few hundred feet at a time. Had it been the same labor cost that I had estimated that the whole system could be reproduced for I should think at once that I had made a serious mistake somewhere.

During this decade the company laid only 3,672 feet of 8 inch mains the labor cost as shown by the gas reports of the company gives .2796 per foot; I have allowed on that main .1911 cents per foot. It is well also in comparing the company's cost with my estimate to compare them also with Mr. Campen's estimate; His estimate running for mains laid in the 10 months when the ground wasn't frozen here are a little less than mine. I have heard referred to and know about nearly ever since I came to Lincoln
1230 the first time a little contract that was entered into on the 11th day of September 1912 between the Nebraska Construction Company and Meeker and Dobson for the *alying* of certain water mains in the village of Dewitt, Nebraska. I want to call attention to it as having aided me in arriving at the price for the cost of labor I have arrived at and the figures set out in this contract for laying a relatively small quantity of mains. This is a water main laid in this locality with about 5 feet of cover whereas I have already stated in my testimony for gas mains a 3 foot cover is all that I believe actually exists on the average and I think it an ample cover for these gas mains. I will read the following extract that I have mentioned: "And it is agreed that the party of the first part agrees to pay the party of the second part in the letter above set forth, the following prices: 4 inch pipe laid per lineal foot 15 cents and 6 inch pipe laid per lineal foot 18 cents and 8 inch pipe laid per lineal foot 21 cents; for every hydrant set in place $2.50; for each valve set in place $1.50 it being understood that the above prices include the taking of the above mentioned material from the cars; the digging and filling of the trenches and the furnishing of all necessary lead and oakum together with all necessary labor for said performance."

If these prices are to be compared with the estimates I have made for gas mains they should be compared with those headed in exhibit "189" of "all except iron" that is, the joining material is included here as well as the labor of laying the pipe and I have included in my items all such iron or labor plus the joining and incidental material, such as might have been furnished by this contract in putting in the works; further it has to be remembered that these pipes had to be laid in trenches that were to the gas trenches here in about the ratio of 5½ to 3½ feet in depth; that is, the trench required to be dug for this pipe would be about 57% greater in depth than those I have estimated as necessary here in Lincoln, at 3½ feet
1231 deep on the average and the other trench at 5½ feet. The gas trench I have estimated to vary from 3 feet of the smaller pipes of the 2 inch size which makes up a great bulk of the plant 3.2 feet; I should think the depth of 3.5 would be the average depth to assume and use as an approximate figure in this computation. The depth of 5½ feet which is necessary for 4 inch water mains,—let alone the 6 inch that requires more,—I have estimated 3½ feet for the 4 inch gas pipes intending to have 3 feet of cover and allowing the half foot for the size of the pipe. The 4 inch pipe will measure a little under a half foot, a little under .5. Now all my prices here for putting in this work, the mains and all the rest of it, are

for the work completely in place and are prices which I don't doubt the work could be readily contracted to be performed for, just as the Dewit job was contracted to be preformed by the parties under that contract.

That includes contingencies and contractor's profit and all liability that arises from injury to anybody in the construction of equipment or trenches. The contractor usually has a regular bond in carrying out these constructions, whether it be for the construction of a gas holder or the construction of mains in the streets, he is bound to indemnify the owner of the property from any unusual injury resulting from his negligence. I suppose as a matter of law, he is liable whether he indemnified himself or not. That clause with almost no exception is in every well drawn contract so as to leave no doubt about it whatever. It is included and is there. Whatever his liability is at law the contract usually and uniformly contains a provision that the contractor is to be liable not only for any injury resulting to his own men, but any injury resulting to any person or property in connection with him as a result of his negligence in connection with the work.

Whether it would cost any more to lift a cubic foot of soil from a depth of 5 feet then from one of 3½ feet,—yet it costs
1232 more; that was strongly brought out here by a witness the other day he says the limit was 10 feet in digging gas holders. Whether or not the parties who had this Dewitt contract are Lincoln Parties,—yet Mr. Dobson is a pleasant acquaintance, I have seen and talked with him about this contract. Objection to the question whether *me* made or lost money on the contract was sustained.

I may say about the reservoir that if the contractor lost in any part of it it will be interesting and helpful to know on which part they made their money. I didn't suppose that they had much of a loss in 1912 and would take another loss on their hands in 1913 at similar prices, at any rate the reservoir contract confirms to my mind what they are willing to take for work in this locality.

Exhibit "193" on page 18 of the valuation folder I will consider with exhibit "195" on page 19. Exhibit "195" is the total estimated in detail headed "cost of 1¼ inch service pipe from main to meter as of January 1, 1907" the items in the exhibit include 50 feet of 1¼ inch pipe which is taken at 14.4 cents per foot, that 14.4 cents being the same figure found in exhibit "189" and the 1¼ inch steel pipe laid as mains. The figure 14.4 cents per foot for the 1¼ inch steel pipe laid as mains includes all the labor per foot on such pipe laid for the purpose but when we come to lay it as a service pipe, owing to the fact that you go to a special or extra amount of labor incidental to the laying of that pipe, an item of 50 cents is added to this detail exhibit "195" entitled "connecting into main" and is a labor item. The total here assigned in exhibit "195" to a 1¼ inch service is $8.588; the exhibit includes only 50 feet of service pipe and the 50 feet was arrived at in this way; by a study of the street map of Lincoln I learned that 50 feet was in my opinion an ample width to allow for the Lincoln Streets a few over run that

figure but a good many are 100 feet wide and quite a number
1233 run under that,—I have thought that if the estimate of the service includes service to the property line, which means a service for an average length equal to one half the width of the street,—it making no difference in what part of the street the mains lay,—I have thought that if the estimate included the cost of the service to the property line from the main it would include certainly all that belonging to the company, and that is the property I am trying to reach. I am not trying to value the property that belongs to the house holder, either inside or outside. That has been a subject difficult to value out and I want to give briefly what light I have on it.

Referring to the corporate minutes of the company, the original company operating here at page 24 of said minutes at a meeting of the directors held June 18, 1872 I find the following entry: "On motion of J. N. Cassel it was ordered that the consumer should be charged with the service pipe from the curb stone or outside of the sidewalk provided they make application before or whilst the mains are being laid down, after that time they must pay for pipe from the mains."

I have assumed that rather burdensome rule on the consumer has not remained in force to that extent, that is, to make them pay entirely from the mains; I think the company has paid some of it.

I call attention to exhibit "206" and particularly to the portion headed "cost of service pipe per gas reports." Wherein the years 1903 to 1912 inclusive appear, and the cost of service pipe as shown in the gas reports of the Lincoln Gas Company is set down; in the next column the total cost in dollars in each year charged to consumers for service pipe; and the total number of services laid from the main; and when I say laid from the main I mean just what that says no matter whether they went to the curb or clear to the meter; in
the right hand column is the total cost of services per service
1234 from the main that includes all so called stub services that only run to the curb and others that run to the meter. Referring to the average cost of those services in toto for the 10 year period there having been 5,749 services so laid from the mains, it appears that the average cost was $12.53, on the face of the reports that purpo-t to be the cost of the services clear to the cellar wall or meter or wherever they went to, I understand the meter. It appears that the total cost of the services, namely, $72,010.54 that $33,789.15 was charged to the consumer, which leaves a cost apparently borne by the company for service pipes during this time of $38,221.39.

Now dividing these costs respectively to the consumer and the company by the number of service pipes laid, at appears that the average cost to the company per service from the main was $6.65 and the average cost to the consumer per service to the main was $5.88,—those two figures together make the total cost per service on the average of $12.53.

I conclude from that exhibit for the 10 years' operation that the policy set out in the corporate minutes referred to although somewhat changed, still required the consumer to pay for a large share

of the service pipe to the extent here set out. I got these figures charged to the consumer from the gas reports, as to the cost of service.

Bearing on the question of who has paid for the services that have come in, I refer to page 165 of the printed record of this case in the appeal to the Supreme Court of the United States; I find on page 165 in the testimony of Homer Honeywell the following answer: "We have charged the construction with the amount we put into the services and credited the construction back with the amount the consumer pays us; or we charged construction with the amount of money we actually put in from the main to the lot line."

1235 The consumer pays from the lot line into his house and for making the connection. I understand from the testimoney I have just referred to that Homer Honeywell was at the time he gave that testimony and many years previous connected with the Gas Company and was at that particular time the manager of the company. So that the average cost, according to those gas reports during this decade which it bore itself, shows $6.65 per service, which I have estimated in exhibit "195" at a cost of $8.588 per service, meaning thereby the 50 foot service set out, but not the entire service that runs to the house and is connected with the meter I think the consumer paid for part of that, and it is all the property of the company as near as I can judge from the records I have read.

As to Mr. Lea's estimate for the cost of the service,—I haven't that figure in mind. I remember distinctly however, that in cross examination he claimed to have estimated the cost of reproducing the cost of the entire service both in the private land and in the public street. Calling attention in this connection to exhibit "196" to the heading "cost of one 1¼ inch service from main to curb as of January 1, 1907." The cost of a service of 1¼ inch steel pipe 23 feet long running from the main to the curb there being some such services.

In this connection I want to bring out simply to point out some difficulties that have arisen. I have seen the use of curb boxes to connection with what is called a curb cock in a service pipe. I don't know what proportion of the services have such a box so connected. Briefly described a curb cock box is a cast iron barrel about 3 feet in length and say 3 inch-s in outside diameter, the bottom fits over a little cock or valve underneath the ground, the top of the barrel when in condition has a cast iron cover the object is to have the cover removed when necessary to turn off the supply of gas in

1236 proper cases. The installation of such boxes in connection with the ordinary service pipe is entirely unnecessary and the fact that the company has discontinued that practice is quite in accord with good practice. When you come to the large public buildings down town it is desirable to have a curb cock and curb box that will allow access to the cock so that in event of a fire or other catastrophy that large service pipe can be shut off. I approve of such boxes in the business district but don't approve of them generally for each gas service running into dwellings. As to the

value of those boxes it complicates the situation because I find that a great number of the boxes are out of repair entirely and more or less filled with dirt so as to be entirely useless and valueless. There ought to be made some allowance on account of those boxes in the business district that are more useful or necessary and I don't think a figure for their cost should be added or brought into the value here. I will try to have as good an approximation later as to the number of these boxes that have a right to appear in the system.

I return to exhibit "193" setting up the cost of the services dealt with year by year as laid just like the mains, beginning with the services laid before 1903 the number of such services which I have taken as existing before 1903 is 2,911, that number of services has been multiplied by the cost of $8.58 as for a 50 foot service giving the total cost of the services that existed before 1903 as $24,976.38; the total cost of services laid to the meter in each succeeding year is estimated in the same way giving the total cost down to January 1, 1907 on this basis of $45,834.36. The total cost for each year as just found are carried into exhibit "194" and set opposite each year there; the years of age of the service pipes are taken to be the same as that of the mains to which they are connected. The percent of depreciation is taken as 2½ for the service pipes and the total found in the column headed "per cent depreciation." That
1237 per cent of depreciation is computed on the cost of the services as laid each year; that on the cost of the services laid prior to 1903, namely $24,976.38, computing the depreciation gives 42.5% amounting to $10,614.00 and leaving the value of $14,362.00 in those services. Each following year is dealt with in the same fashion so that the result is the footing in "194" gives as the total cost of service pipes $45,834.36; the total per cent of depreciation 24.9; the total dollars of depreciation $11,435.00; and the total value as of January 1, 1907, $34,397.00. These figures are then carried forward into exhibit "184" as the cost and value of the service pipes of the company.

Coming now to the paving as it exists over the mains, as it would have to be cut and replaced if new mains were laid to replace those that existed as of January 1, 1907 as that is the property I am talking about.

Exhibit "197" is headed "Cost of paving over mains relaid," the first column of that exhibit is the inch size of mains existing under paved streets. The next column the feet in width of the earth trench in which the mains are suppose- to be laid, being the feet of width that has been previously dealt with in estimating the cost of laying mains. The next column headed "Paving cut feet wide, and square feet, per foot of mains," that is, you have that width and multiply it by one to get your square feet per foot. The width of the paving has been increased over the width of the earth trenches as appears in exhibit "197" by the addition of .4 of a foot in each case, which is ample for the purpose. That is a .4 of a foot is added to the width of the dirt trench to get the width of the paving that must be dealt with; the final column of exhibit "197" is headed "Cents cost cutting and repaving per lineal foot main at 25 cents per square foot of pav-

ing" and resulting in the figures of 47½ cents per linear foot of 2 inch mains to 77.5 cents per linear foot of 20 inch mains that
1238 must be laid under paving.

Now as to that phrase "must be laid under paving" I call attention to exhibit "213" headed "feet from curb line to lot line on all paved streets in the City of Lincoln September 1, 1913."

Exhibit "213" sets out in detail the names of the paved streets and parts of said streets on which the paving lies between which streets; the length in feet of said paving between said point, the feet in width of street; the feet in width of the paving in the street; and the feet from the curb to the lot line of the street; that is *said* out in detail for every piece of paving supposed to exist on September 1, 1913 in the streets of Lincoln. The results of exhibit "213" are consolidated in exhibit "214" which is headed "total length in feet for each district from the curb to lot line on all paved streets of the City of Lincoln"; and shows in one column the length of the paving; the next column the corresponding number of feet in the street from the curb to the lot line for that length of street where the paving lies. For instance, for 1,800 feet of paved street in the City of Lincoln the distance from the curb to the lot line on either side of that paving is only 11 feet; for 2,257 feet long of paved streets the distance from the curb to the lot line is 15 feet. I am picking out one or more important numbers. For 24,040 feet long of paved streets the distance from the curb to the lot line is 20 feet; for 24,620 feet long of paved streets the distance from the curb to the lot line is 25 feet, these distances from the curb to the lot line are outside of the paving the unpaved portion on either side of the paving and for 51,150 feet long of paved streets the distance from the curb to the lot line is 30 feet on either side, that 51,150 feet is just about 10 miles; for 22,740 feet long of paved streets the distance from
1239 the curb to the lot line is 35 feet; the highest distance is 45 feet of which there is only 820 feet long of paved street.

Referring to exhibit "215", being information obtained by me from the city engineer's office in a form that I had requested, there is shown a length of 39,080 feet in the so called business district of the city where the sidewalks are supposed to extend from the lot line to the curb and where, therefore, no mains would be laid outside of the paved street, because in contemplation at least, they would have to cut the sidewalk paving which would probably be undesirable.

The point I am making is that the greater portion of the mains along paved streets can be laid in the unpaved portion of those streets. I don't express that as an opinion in the so called business district where the ordinance, as I am told, requires the sidewalk paving to come to the curb so I have found out how much of it is in the so called business district.

By that I mean it could be laid there, I don't dispute anything the company has said about the location of its mains; I am simply pointing out that they would be laid in the other place cheaper, but I am not going to lay it in the business district under the sidewalks because the ordinance don't allow it. I expect to subtract the 39,080 feet from the grand total, I do that precisely.

Exhibit "216" is a tabulation made up at my request in the city engineer's office and the first part reads: "The following is a list of the streets where the water mains are laid between the curb and the property line and also a list of the streets where the water mains are laid directly under the curb." Then follows the heading: "Water mains outside of curb," meaning thereby as I understand it water mains between the curb and property line in the unpaved portions of the street. The length of such mains and the streets and
1240 portions of streets where they exist being stated as here shown to be 39,070 feet. I may say that I got tract of this information by finding that the water gates were commonly or in many streets projected off in the park space.

The water system includes, as I learned nothing smaller than 4 inch pipe and from that up so that we undoubtedly have in this park space in addition a large amount of 4 inch and 6 inch pipe at least, not to say anything of any larger sizes whereas the great bulk of gas mains now laid under paved streets, is 2 inch pipe, next to that the 4 inch size. I will not suggest that anything larger than 4 inches should be laid in the parks, it is a very different thing to lay and use and get out to the 2 inch pipe or even 4 inch pipe in that park space than it would be to lay 10 or 12 inch or larger in such space. For all practical purposes the district where the larger gas pipes are would coincide with what I call the business district, that will appear later.

Continuing with exhibit "216" it appears also that in addition to the 39,070 feet of mains that lay entirely outside of the paved portion of the street, there is another 33,880 feet that lay in what is called under the curb, I understand that to be just under the edge of the curb so that in digging down straight past the curb you can reach the side of the main and with sloping the soil under the curb get all around the main.

Being firmly impressed that anybody reasonably advised who attempted to reproduce such mains as are in the City of Lincoln would *aly* them outside of the paved space and I was helped by finding that the water system had been laid in a substantial part in just that way.

I want to refer to some of these drawings. Exhibit "222" is a blue print showing a portion of "B" Street from 13th to 14th, here is the paved street 30 feet wide that leaves on either side from the curb to the lot line 35 feet the street itself is 100 feet wide, the row
1241 of small dots indicates the location of the trees. That is a sample of one of the streets with wide park spaces. It is one thing in the duplication of a gas plant to believe that the city authorities would require or permit the paved street this narrow strip of paving in the street to be cut when they have in this city millions and tens of millions of perfectly accessible and good grassy spaces on either side of the paved streets in which the mains might be laid. Of course, the thing hasn't been done the mains have been laid when the paving wasn't there and the paving was laid over them, I certainly shall never be the first one to say that any well advised person would cut up the streets to allow 2 inch mains to be laid therein when they could run through the park space with greater facility.

Coming again to exhibit 198 under the heading "Feet of mains to

be relaid under paving in 1907" at the left hand is the size of the mains; the next column is headed "Miles under paving per Malone"; meaning the miles that Mr. Malone who appeared for the company as a witness as shown in the printed record of the case as his testimony as to the length of the mains under paving in 1907. Those miles are simply reduced to feet in the next column which is headed; "Feet under paving in 1907"; the original testimony there dealt with miles. I have taken his average and reduced to feet. The next column is headed; "Per cent to be relaid under paving" that shows the per cent of the total length now under paving that is to be, or would be in my opinion, with reasonable necessity relaid under paving for this gas system if the gas system was to be duplicated and what a prospective purchaser of this plant who wants such a plant would reasonably contemplate as the amount he would have to lay under paving if he didn't buy the existing mains.

Now I want to deal with the mains of 6 inch and larger as shown in exhibit "198", of those that were under paving in 1907
1242 it is assumed would be relaid under paving. The 20 inch mains were not then and are not now under paving but the 16 inch mains were then under paving, according to the testimony of the company I assumed they wouldn't be relaid the reasons are I think they are mainly in the business district, that is one reason.

Coming to the 4 inch mains,—the 6 and 16 inch mains don't give the total length sufficient to cover the business district last year, but I haven't it definitely limited to the business district in 1907, I have assumed that it was about the same as in 1913, it certainly couldn't have been any greater, so I have allowed enough 4 inch mains in connection with the larger sizes to equal the 39,000 feet in that business district where the sidewalks are laid from *crub* to property line: then I have allowed enough more 4 inch mains to represent 20% of what would lay outside of the business district and in that way I get the 45,834 feet. That 20% represents what I consider a fair allowance for the amount of that 4 inch main outside of the business district that might reasonably be expected to be laid under paving due to one cause or another. If you lay your mains in the park you have got to cross even at the street intersections anyway and taking the paving at 30 feet and the block at 400 feet there is a small percentage there, and for various other causes, as shown by my tabulation you will run into some cases where the width of the park space is narrow to run into that and then the trees might bother so you wouldn't think it advisable to run there and better to cut the paving; so I have allowed 20% as laid under paving, the combination of the 4 inch I assum- would be relaid in the business district and 20% of the remaining 4 inch, that for various causes would have to be relaid under the paving, makes up the 33% of the 4 inch mains which I estimated you would have to lay under the paving.

Now coming to the 2 inch mains, to estimate it that 20% of that would have to be relaid under paving it being considered
1243 that of all the 39,000 feet of the mains in the business district is of the larger size. If that is not correct it is in favor of the

company because if part of the 39,000 feet must be covered by 2 inch mains it don't cost as much to relay 2 inch mains as 6 inch mains.

Taking the quantities in the right hand column and arrived at that as I have indicated we have the feet of each size of mains to be relaid under paving as of January 1, 1907, which amounts to 47,572 feet. In exhibit "199" the feet of each size of mains is carried over from exhibit "198" and the cost per foot of mains is carried from exhibit "197" and we get as a result the total cost of paving over mains. The sum of that total cost ov mains is carried back into the distribution system and there set up as the cost of the paving.

I would suggest that the remainder of the testimony as to the value of 1907 which deals with a little service and meters is just of the kind that applies to 1913.

Mr. ALTON D. ADAMS, a witness for the defendant, having been previously sworn, resumed the stand for examination in chief.

Examination in chief by Mr. Foster:

I have made a valuation of the Lincoln Gas & Electric Light Plant in the City of Lincoln as of January 1, 1913. Exhibit '231" is that valuation arrived at by me.

The total value of the Lincoln Gas Plant used and useful for the supply of gas for the City of Lincoln is found in exhibit "231" and the footing of the column at the right hand side of the page; the amount of the value of the plant is $415,745.00; the cost of procur-
ring here a like plant or equivalent plant to that employed in
1244 supplying gas to the City of Lincoln on the first day of January 1913 I estimated to be $551,500.70; the total depreciation to be deducted from that cost is $135,827.00 leaving the value on the first day of January 1913 of $415,745.00.

This is subject to a reduction for a portion of the plant as yet undetermined, which should fairly be allowed for the supplying of gas to places outside of the corporate limits of the City of Lincoln, a portion of the generating capacity and other parts of the plant that actually lie in the City of Lincoln and used to some extent to make and supply gas outside of the City of Lincoln. For instance, the water gas generator at the Lincoln plant generates all the gas when the benches are all running part of that gas is carried outside of the limits of Lincoln and sold; a deduction from these figures in so far as the property employed in supplying Lincoln is concerned must be made for the gas that is sold outside of the city limits. That deduction has not been made and when I finish up my testimony in this case I will make that deduction.

I have made a comparison between the difference between my valuation as of January 1, 1907 and as of January 1, 1913 and the construction account of the company for the same period.

It appears that if from the value which I found for the Lincoln Gas Plant used and useful in the City of Lincoln on January 1, 1913, namely, $415,745.00 there is deducted the like value for said plant on January 1, 1907 of $279,915.00 there remains $135,830.00 rep-

resenting the increase in value which I find from January 1, 1907 to January 1, 1913. By reference to the construction account testified by Mr. Wiggins in this case I find that on January 1, 1913 the sum total of the construction account of the company as to its gas plant was $784,307.00, and on January 1, 1907 the construction account of the gas company on its gas plant was $573,870.00 showing an
1245 increase between January 1, 1907 and January 1, 1913 of $210,473.00, in the construction accounts as they appear on the books of the company relative to the gas plant. This $210,437. increase in the construction account is $74,607.00 greater than the increase in value that I have found relative to the gas plant, namely, $135,830.00.

The difference is to be accounted for in several ways as follows: in the first place there is the fact mentioned in my former testimony that only by extending and enlarging the property can you maintain the value that exists as of any particular date, a hard physical fact that we can not escape from. The plant the company had on January 1, 1907,—its individual pieces and parts have been shrinking in value,—and the extensions of the property and its enlargements have necessarily gone in part, one any proper view of depreciation, to offset the shrinkage in value of the parts that were there on January 1, 1907; and as I have computed the depreciation in a like method on both dates, if that shrinkage in value by reason of depreciation, is reflected in my figures, and if the construction account has been carried along by charging everything to construction that represented an enlargement or extension of the plant, I should expect that the increase in the construction account would substantially exceed the increase in value which I found. I am not testifying now just how the construction account has been carried along, I am not ready to deal with that matter yet but I say if the account has been carried along during this period from 1907 to 1913 by charging the construction with substantially all the enlargements and extensions of the property that would necessarily result, as far as the construction account is concerned,—with larger figures in book value than I should find in estimated value. Owing to the fact that I should depreciate the property during the period from 1907 to 1913 at the rate at which I place the property
1246 as depreciating during the period, and so that the part of the extensions that have been made during that period, as to their value, would simply go to offset the parts there were there on January 1, 1907.

There is another reason to be mentioned in connection with the difference of $74,607.00 that appears between my increase in value and the increase of the construction account; that is the difference in price. The prices of pipe, which remains a very substantial element in the value of gas property have declined since 1907 and I am using in the valuation of the property as of January 1, 1913, a lower price for pipe than I used in the valuation as of January 1, 1907. That might account for a little of the difference, but ought not to account for much of it because the company has been buying along at the market prices and only charging it up at those prices.

I assume that, I don't testify positively beyond that, if they were so, it wouldn't make much difference but still there should be a difference. Unless the price of pipe after 1907 fell at once to the price of January 1, 1913, whether the company would have charged into its construction account pipe at a somewhat higher price than I have taken at January 1, 1913, assuming that is,—if properly taken at the market price of January 1, 1913.

A further substantial part of the difference between my valuation as of January 1, 1913, and January 1, 1907, as compared with the increase in the construction account, is due to the fact that within that period a large portion of the investment of the company in additional gas plant has been for the supplying of places beyond the limits of the City of Lincoln. Large extensions in pipe have been made into University Place and Havelock, a desirable device has been installed for the supplying of gas entering into that of a con-
1247 siderable scale; and a holder has been erected at East Lincoln, undoubtedly to my mind,—for the purpose of carrying on that supply outside of the corporate limits of Lincoln. I have eliminated the holder, mains and extensions of the plant from this total of $415,745.00 as my valuation of 1913; I have only valued the property used and useful in supplying the gas here in Lincoln. I haven't figured the outside at all.

Exhibit "258" is entitled "Gas plant in Lincoln, University Place and Havelock" the said exhibit represents a map of the City of Lincoln and the municipalities of University Place and Havelock. In the City of Lincoln which is bounded by the outer broken line on the map and whose wards are bounded by the inner heavy broken line is shown the location of the existing gas plant as of January 1, 1913. The location of the plant which was opened about the year 1890 by the Gas Company,—said location being indicated by a heavy square simply on the map,—on the map is also indicated by a heavy circle what is know- as the East Lincoln Holder being the 100,000 cubic foot gas holder erected by the company in 1910; in each ward of the City of Lincoln as indicated by the broken lines of the map is a figure for the population as determined by the Federal Census of 1910 showing the population of each ward in the city; running from the location of the East Lincoln holder is shown the location of a 4 inch gas main extending out into University Place and Havelock and passing either near or through what is known as University Place; also outside of the corporate limits of the City of Lincoln.

The wards are represented by the large numbers 1, 2, 3, 4, 5, 6, and 7, on the face of the map adjacent to the figures for population.

1248 This Exhibit "258" has been prepared to assist in showing the reason for excluding the East Lincoln Holder from the property necessarily used for the supplying of gas in the City of Lincoln itself. It is obvious that the 4 inch main, as well as other mains and other gas properties, lying outside of the City of Lincoln in Haverlock and University Place is not property used or useful in the supplying of gas to the city of Lincoln. It happens, however,

that the so called East Lincoln holder is actually located within the city limits of Lincoln. It has appeared to me that the 100,000 cubic foot holder so located at or near the boundary of the City of Lincoln is not at all necessary to the supplying of gas in the City of Lincoln, and in my opinion never would have been put in that location had it not been for the desire to furnish a gas supply in University Place and Havelock. Some of the more important reasons leading to the conclusion are as follows: The East Lincoln holder is situation on the opposite side of the city from the gas manufacturing plant where the gas is made and where the other holders of the company are located.

It is situated in Ward 7 where the population in 1910 according to the Federal Census was 6,103.

It happens as appears from the face of this map, that other wards of the city of as great a population, and as great or greater distances from the gas manufacturing place are not provided with any district holder. Take Ward 6 where the population is 6,571 its distance as appears from the map, is substantially as great from the manufacturing place as in Ward 7. Take Ward 1 a large part of which is at a greater distance or as great distance at least, from the gas manufacturing plant as Ward 7, it is not provided with any district holder. It is stated to me that there is no gas supply in a part of Ward 1 where the population is 6,571 and if contrary to my opinion it is necessary to set up gas holders around the different parts
1249 of the city that happen to be distant from the gas plant where a gas supply has to be rendered and it is just as much reason to put a gas holder out in Ward 6 and almost as much reason in Ward 1 as in Ward 7.

In my opinion there is no necessity and no reasonable need for a gas holder apart from the gas plant in any ward of the city.

Furthermore, if the so called district holder was really erected in Ward 7 for the purpose of supplying that portion of the city it is reasonable to suppose it would have been somewhere in the central part of the population and not out on the edge of that ward and on the city limits, the population is very scattering; most of the population is no where near the holder. The service would not be as effective from some other point in Ward 7 as where it is located for the municipalities, they are too far away by the same token if it is necessary to have a gas holder out near the consumer in Ward 7 that ought to be out somewhere near the middle of the population and not set out in one sparcely settled portion.

In connection with Exhibit "258" there are some events which need to be noted in the order of their occur-ence. As appears on one of the exhibits of the company a report was had by it from an engineer as to an increase of the gas pressure of the city for the purpose of better supplying the east side of the city, which would include Ward 7 that report was dated July 22, 1908, it says nothing about the erection of an outlying holder in Ward 7 or any portion of the city but does recommend an increase in the pressure and an adjustment of the street valves so that the pressure may be directed particularly into the east side of the city. That was July 22, 1908, at

that time as far as I have learned from the records of the company, the company was making no substantial use of service gov-
1250 ernors and I assume was not putting gas on to the city with the pressure that has since been adopted in general. A service governor may be explained as a device connected on to the service pipe, entering the premesis of each consumer, usually next to the meter, and intended to reduce the pressure of the gas as it comes from the street main and through the service pipe and before it get-into the house pipes the object being usually to enable the gas mains to have the gas sent through them at a pressure substantially greater than would be suitable for use in the house. A service governor enables any pressure that may exist in the street mains to be reduced to any predetermined amount in the house pipes of the consumer, so that instead of 2 or 3 inches of water which are good for a consumer at his burners,—that is usually measured by water,—the gas company may operate it at 10, 20, 30 or 40 inches of water in its street mains thereby increasing the carrying capacity of the mains of a given size and length, so that the use of service governors is on the increase very decidedly and the use of higher pressure in parts at least of street main systems,—is rapidly increasing over the country. The service governor is not always adopted as the device to make such increase practicable. We obten have what is known as district governors. It is not necessary to go into that now, but at any rate these service governors are what enables a substantial increase at which the gas is forced through the system began to be bought by the company in the early months of 1909 before there was any gas supplied to University Place or Havelock, and after this report of 1908 which called attention to the fact that in a certain portion of the city the pressure wasn't great enough.

Having adopted the use of the service governors it was open to the company to largely increase the pressure in its mains so more gas would flow, and so that the pressure in parts of the city where it has formerly been low, could be put up to any reasonable
1251 figure that might be desired.

I judge that the pressure has been increased at the plant sufficiently to enable a satisfactory pressure to be delivered to the consumers all over the City of Lincoln. I don't think the pressure existing at the plant would enable sufficient gas to be delivered to Havelock and University Place at times of maximum demand without a good deal more investment in the pipe system than has been made out there, Of course, if we have a lot of big pipe it will carry at low pressure but if you want to carry an equal amount through small pipe you must have a high pressure.

Pressure has this bearing, particularly with mains constructed and the service pipes connected as they are in the greater part of the gas system here; as you run up your pressure you increase your leakage. That is the disadvantage here in Lincoln, it represents a constant loss of the manufactured product the company has to sell, other things being equal it is desirable not to increase the pressure beyond the point necessary to get your gas through the system.

Whether to that extent the East Lincoln holder is a benefit in the

931

way of saving or reducing leakage.—only this far, if you are taking into account the supplying of University Place and Havelock which are outside the city limits, I find no reason to suppose that the pressure isn't sufficient to satisfy the consumers in the City of Lincoln, with no more expensive leakage than they are having. As to whether it is not beyond the point to which they are now leaking, that is a point I am going into later.

The distance from this East Lincoln holder to the end of this main in Havelock is rather greater if anything than from the holder to the gas works. There is a long distance to be traveled by the gas to get out into this suburban territory and it means a very
1252 substantial investment in the suburban territory and a further investment in the limits of Lincoln or else the erection of that holder. The holder erected in East Lincoln might better, insofar as the service of this suburban territory is concerned, be located out there in suburban territory instead of being put out in the City of Lincoln by putting it on the edge of the city brings it in the city limits and that may be the object.

Here is a report recommending to the company an increase in the pressure in 1908 and here was an increase in pressure put into the mains and the adoption of service governors in January and February 1909 and then we come to June 29, 1910 when the contract for the tank for that East Lincoln holder was let. Now up to June 29, 1910, there had been no gas sold in University Place and Havelock no mains had been extended as far as I am able to learn from the records of the company but in September 1910, 2 or 3 months after the contract for the East Lincoln holder was let, the order was given to extend the mains out into University Place and Havelock. During the year 1910, it appears from the records of the company, that 16,103 feet of 2 inch mains and 18,500 feet of 4 inch mains were laid in University Place and Havelock. The first mains laid in those municipalities following right on the heels of the East Lincoln holder, which to my mind was erected for the purpose of enabling the service to be rendered out in University Place and Havelock, and for no other main reason. Gas was sold in 1910 from those mains running out there, according to the reports of the company.

Furthermore before that there had been sales of gas at the State presume, furnishes another reason for the erection of the East just beyond the East Lincoln holder. It is called College Farm according to exhibit "N" of Mr. Lea's testimony. Gas was supplied in 1905, and it increased from 1905 up to 1908; in 1908 at the State Farm 1,295,400 feet of gas was sold. From that point
1253 the volume of gas sold in the State Farm decreases and in 1910 only 1,032,400 feet were there sold. That decrease I presume, furnishes another reason for the erection of the East Lincoln holder. I infer the reason for the decrease in the consumption of gas in this district beyond the city limits was because of the unsatisfactory service due to the lack of pressure, I don't know of any other reason that would account for it. That would be my inference from the lack of information. Particularly that I notice

that in 1911 after they got the East Lincoln holder up the sales of gas in the State Farm jump up to 1,280,600 feet again. And in 1912 was up to 1,477,100 feet. So that there was a decline in the consumption of gas at the State Farm from 1908 to 1910 and after 1910,—in the latter part of which year the East Lincoln holder was erected,—the consumption of gas at the State Farm went right up again as we would expect after the bad service had been changed to good service and inadequate pressure had been changed to adequate pressure.

Taking the facts I have stated, in connection with the dates I have pointed out, the decline in the consumption of gas of the State Farm with the desire to serve University Place and Havelock, were to my mind the moving reasons without which the East Lincoln holder would never have been erected.

The erection of the East Lincoln holder was of no substantial benefit to the territory served within the corporate limits of the city one that might not have been readily obtained by an increase in pressure, a little greater increase in pressure.

The East Lincoln holder is substantially as far away from Wards 5 and 6, which are in population equal to or greater than Ward 7 as it is from the gas plant itself. It is on the edge of Ward 7 and in a location where the population is very sparse, it is right next to the outlying municipalities of University Place and Havelock into which the service was first run since the East Lincoln
1254 holder has been put up.

Further reasons along the line I have indicated are drawn from the study of the so called skeleton map of the Lincoln Gas Company dated in 1911 being the latest copy I have been able to procure whether said map is numbered as an exhibit previously I don't know. I will say this as to this skeleton map, we are making up the map in which the sizes of the larger mains will be marked, and which I think is the purpose to make a photograph of and a permanent copy showing as this map shows but not so clearly, that taking a line running east and west from the gas plant if I have the points of the compass right the weights of the larger mains is on the east side of that line. Here is the East Lincoln holder the size of the mains on this skeleton map is supposed to be indicated by the width of the line, they are set up and drawn at 1/128 of an inch to equal an inch and the drawing of the line we have put to scale that way, which is a very delicate matter and not entirely satisfactory unless executed with great care, so I thought it would be plainer for the court and all the parties to have the sizes of the larger mains marked right on the map and we are preparing a map with that in view on which the East Lincoln holder later can be located, and it will appear from that map, as appears from that skeleton map, that drawing an east and west line from the gas plant the weight of the larger mains are on the east side of the city rather than on the west, whereas the greater population and volume of gas is undoubtedly sold on the west side of the city. I mean by the "weight," I refer not to the pounds of the mains but to the size. If we had a large main in one district and a small one in another we would say we

have the weight where the mains were of the larger capacity or size and I am not referring particularly to the pounds. The map last referred to is plaintiff's exhibit "78."

While the skeleton map exhibit "78" is not entirely satis-
1255 factory as the corresponding exhibit we propose to compare because it does not show the location of the East Lincoln holder or the gas plant, still it does bring out by reason of the heavy lines and their location the fact that the east side of the city has in its outlying parts more large mains than the west side of the City.

I have my directions wrong. To state that again the skeleton map shows the size of the mains greater on the northeast side where the East Lincoln holder is, than it is on the Southeast side. Whereas the population is just the reverse. There is more population in the Wards 5 and 6 on the south side than in Wards 3 and 7 and to my mind the arrangement of the mains, a substantial part of which was run out about the time this East Lincoln holder was put up is designed as is the East Lincoln holder it is in part to further the supply of gas beyond the limits of the City of Lincoln. We have a comparitively heavy line of main running out to the northeast corner of the City of Lincoln, we have a district holder located in the northeast corner of the city; and we have extending from that northeast corner another substantial set of mains to as great or greater distance from the East Lincoln holder as that holder itself is from the gas plant, namely, Havelock and University Place. The gas plant on this skeleton map would be located at the end of the main marked 20; that is marked for the 20 inch main although the gas plant is not represented on there that is where it is.

I think I have now answered the question as to my reasons for excluding the East Lincoln holder from the property necessarily used and useful for the supplying of gas in the City of Lincoln. I might add that there is some machinery located at the East Lincoln holder that participates to increase the pressure of gas and send it out at an increased pressure into the mains to University Place and Havelock, and I assume also into some of the mains here in northeast Lincoln that supplies gas for themselves. In places of the size of
1256 Lincoln and much larger the preva-ling and good practice is to get your holders concentrated at your gas manufacturing plant. In very large cities, or where you have a very large service area with a large demand, like New York and Chicago, you will find holders scattered around but in a city like Lincoln with its population and area there is no occasion, nor is it common or good practice, to scatter your holder over the service area. You are obliged to incure a large operating expense and keep somebody out at your holder to steam it up that usually implies the use of a steam boiler somewhere, at either the holder at the plant or in East Lincoln. There was a time 25 years ago in the history of gas making it was thought good practice to sprinkle your holders around over the service area. It is an antiquated custom, I could point to a dozen such holders that have been abandoned and no longer in use, the custom is entirely moss grown, and everybody recognizes now that

the place to put a holder is at your gas manufacturing plant you can get steam and keep them from freezing and give them suitable attention without unnecessary operating expenses.

There is a kind of a situation in which the holder becomes reasonable and is now common, namely, holders for the supply of gas far removed from the gas plant and not for the supply of the city in the midst of which the gas plant is located, a mile or two or three for the supply of far removed places owing to the greater economy of manufacture, it is increasingly common to supply several of the smaller municipalities from a single gas manufacturing plant. These municipalities may be anywhere from 5, 10, 15, 30 or 40 miles apart, the gas in such place is made at one central plant favorably located for the carting and material, etc., and is transmitted through pipes by high pressure to these outlying stations, often in such cases as that it is advisable to erect an outlying or district holder, in some one or more of these places far removed a number of miles from the gas plant. The reasons that underlie the
1257 principle are about as follows: Suppose you have a gas manufacturing plant in "A" and you want to deliver and supply gas in another municipality at "B" 20 miles away; the demand for gas during the different hours of the day is irregular, it must be supplied much faster during some hours than during others of the 24, so that with a given pressure in your mains to force the gas from the works to the municipality 20 miles away, if you depend on your mains alone to supply the gas for that municipality as fast as it is wanted there you will have to have a main of much larger size and greater cost than you would if the gas supply were spread over the 24 hours of the day evenly. If you have a gas main 20 miles long and you can substantially reduce the size of it be putting a gas holder at the far end, it often is the case you will save more than enough in your main by erecting that gas holder 20 miles away to more than pay for the gas holder. And you will have the further advantage and a greater certainty and assurance of the supply at the distant point, if you have a few hours' supply of gas stored at that point. So that in connection with high pressure transmission of gas it is not uncommon to find the use of holders anywhere from 10 to 30 miles from the plant for the purpose of saving in the cost of the main that would otherwise be necessary, because in that way you could make a 2 inch main do the work that a 4 inch main might be required for otherwise; and you make more secure the supply of gas in the distant community, because if you take 20 miles of mains it is quite possible to have something happen to it and the shutting off of the gas supply is a serious matter and one that is desirable to avoid if possible. The distance from the works to the East Lincoln holder measuring on this map in an air line is about 9 inches, the fairer way would be to measure around the square it don't make any difference what street you measure on. Measuring around
1258 the streets I make it about 11.7 inches or about 17,000 feet from the gas plant to the East Lincoln holder and 17,000 feet is a little over three miles. The distance of the line beyond the East Lincoln holder according to my hastily made figures which are

given subject to correction it is 25,000 feet from the East Lincoln gas holder to the end of the 4 inch main in Havelock that would be substantially 5 miles.

Explaining how I arrived at my total valuation of $415,745.00 of the Gas Company's property January 1, 1913 as shown by exhibit "231,"—in a general way I will say that the valuation of the gas property used and useful in Lincoln for the supply of gas has been arrived at as of January 1, 1913 in the same way and by the same processes that were employed in arriving at the value of the gas plant in Lincoln as it existed January 1, 1907. The land actually used and useful for the supplying of gas in Lincoln is the only land valued,—just as it was in 1907,—for that reason all the Peck's Grove property has been excluded from the valuation, because such part as is used for the gas business is, to my mind, used for the main purpose of supplying gas in Havelock, University Place and the State Farm, and it would not be used were it not for rendering a supply in those places. That Peck's Grove property is also used in part for the electrical supply. There is a bank of transformers and electrical lines on the property not at all necessary to the supplying of gas in the City of Lincoln. Speaking of the property on which the gas holder is actually located, and the property across the street has no signs of gas anywhere on it, and I don't see where it would be required so far as the gas supply is concerned so that the only land valued is the land actually occupied by the works in block 79 and half of M Street lying along one side of the block 79, which I understand has been vacated by the city. While I notice there is considerable property piled up on block 76 as a matter of storage, I
1259 don't understand they own that. If they pay rent for it it undoubtedly appears in their operating expenses. I valued block 79 together with one h*lf* of M Street in front of it as the land useful for supplying gas in Lincoln.

The buildings located on that land which are estimated in exhibit "231" cost for their reproduction $28,135.00 and have a value as of January 1, 1913 of $19,903.00. Those buildings are valued in the same way and the same figures were used that were used as of January 1, 1907, my opinion being that there is not enough change in the cost of constructing the buildings between January 1, 1907 and January 1, 1913 to affect the validity of any of these values I have made on the buildings.

The valuation of the buildings is only partly mine; it has been arrived at in this way; by taking the quantities of brickwork, stone work and excavation testified to by Mr. Lea and applying thereto 40 cents for excavation per cubic yard; $15.00 for the brick work per thousand, for brick laid in the wall; and $7.00 for any concrete in position per cubic yard; that is the same process that also applied in 1907. Aside from the items I have mentioned, the figures testified to by Mr. Lea for the cost of all the parts of the buildings, except concrete and stone work, brick work and excavation, have been assumed as correct. On those excepted items I assumed the quantities but applied a different unit price, I applied the unit price which I think is proper, and added to those quantities arrived at by my unit

prices,—that is the cost of the quantities that Mr. Lea has given taken at my unit prices,—is added to the cost of the other parts of the buildings as testified to by Mr. Lea to arrive at the cost of the buildings. I have then depreciated the buildings to arrive at their value according to age in the way that was extensively set out
1260 in my former testimony which I need not here repeat.

I have taken all the buildings that Mr. Lea shows as of January 1, 1913, all that the testimony shows as existing and brought them into my figures and have applied my own unit prices to a substantial part of that building construction as it existed January 1, 1913, and the results of the process are set out in detail in exhibit "236" on pages 14 and 16, and the value of the buildings is shown in exhibit "231" on page 1.

The works equipment as shown on exhibit "231," all of the items of equipment enumerated in the testimony on behalf of the company have been dealt with; in the main I have put my own price on the pieces of equipment, and in a few instances of minor equipment I have assumed the cost testified to on behalf of the company.

The foundations for all of the masonery have been estimated on the basis of the quantities testified to on behalf of the company in the testimony of Mr. Lea; and the quantities of the foundations, excavation, concrete, brick work and stone work have been estimated as to their cost on the uniform prices of 40 cents per cubic yard for excavation and the disposal of the material so excavated; $15.00 per thousand brick laid for all brick work; $7.00 per cubic yard for all concrete in position. Those figures don't apply to the old 50,000 cubic foot and the 200,000 cubic foot gas holders. Those holders were in existence on the first day of January, 1907, and were formerly valued by myself as of that date, and I have explained that in the valuation of the 50,000 and the 200,000 cubic foot gas holder I had used as a process by which to reach my conclusion as to the value the cost of holders of equivalent capacity but of different type, as of January 1, 1907; that different type of holder does not require the excavation of nearly so expensive a character as the so called masonery tank holder, which is represented by the
50,000 and 200,000 cubic foot holders down at the plant,
1261 so that I have not had occasion to assume the quantities of excavation and masonery testified to on behalf of the company for the 50,000 and 200,000 cubic foot holders, having estimated on a kind of holder that does not require so much excavation or masonery work, but requires more steel work. The costs that I have allowed for the various items of machinery at the works including the holders have been properly made sufficiently large so as to cover any fluctuation or change in prices between 1907 and 1913, and the same costs have been used for the various items as of 1907 and 1913. As far as there has been no charge of costs assigned to those items of equipment all foundations have been estimated in the same way and at the same amount, and the cost of the items of equipment, but the water gas machines or coal gas benches has been set down the same in each year.

A substantial number of items of equipment has been added

during the period between 1907 and 1913, each and every one of those items has been included, unless it has been omitted by mistake, that is covered by the testimony of the company as of January 1, 1913. The valuation as of January 1, 1907 fails to include a large part of the property that now exists at the works, because said property has been added since January 1, 1907, notably two 7′ 6″ water gas machines, and the 500,000 cubic foot holder, and some other substantial items of property.

The works equipment estimated cost as of January 1, 1913 is $160,069.00; the depreciation is $38,065.00 and the value as of January 1, 1913 is $122,004.00. The real estate is the same as in 1907 with the correction as made in the verbal statement. The land now stands at a cost and value of $2,625.00 I having included in this $2,625.00 the half of M Street vacated along one side of the block 79 occupied by the gas works; the exhibit showing the valuation as of January 1, 1907 did not include that half of M Street in it, not having been called to my attention that the street
1262 was vacated, and I added it in my verbal testimony as of that year.

Now on the distribution system the estimated cost as of January 1, 1913 is $324,659.00; the depreciation is $80,644.00; the value of January 1, 1913 is $244,015.

In the case of the meters in the distribution system the same costs and prices have been applied as of January 1, 1913 that were applied as of January 1, 1907, the difference being that a much larger number of meters to be dealt with on January 1, 1913 so the estimate of cost and value of meters in 1913 is much larger than in 1907, but the unit prices used are the same for both years, having been no change in the price of meters during that period that would make necessary any change in the costs that I have estimated. In the matter of service governors, their use has almost entirely spring up in this plant since 1907. No service governors were included in the valuation of 1907 for the reason that I don't understand that any then existed in the plant. Whereas now there is a large number of service governors and they have been included in the valuation as of January 1, 1913.

Service governors began to be applied to considerable extent apparantly in the early part of 1909.

The paving in the distribution system has been dealt with on the same basis in 1913 as in 1907, except that the amount of paving is much greater in 1913 than it was in 1907, and the total cost is increased over the services and over the mains. The same costs for excavating in the streets and for the laying of the mains that were assumed as of January 1, 1907 are assumed as of January 1, 1913; those costs of excavating and laying mains have been taken at a figure at which the work might easily have been let by contract at either period and being sufficient for the entire period or any part of it.

1263 The cost of the pipes themselves both steel and cast iron pipe, a different rule has been followed: namely, certain prices per tone for cast iron pipe and per foot for steel pipe, were

taken as of January 1, 1907 and certain other and lower prices for the cast iron pipe and steel pipe are taken as of January 1, 1913, because the price of both those sorts of pipe was a little lower in 1913 than it was in 1907.

Arrived at in that way there is shown in exhibit "231" a total cost of $515,488.00 to replace all the parts of the plant necessarily used in the supply of gas in Lincoln, except the expense for engineers and loss of interest, and some minor incidental expenses, which are covered as the similar expenses in 1907 were covered by adding 7% to the aforesaid costs. That 7% amounts to $36,084.00 which would in my opinion, have been very ample to cover those items of expense, namely, engineering, interest and some minor expenses. That engineering, etc., added in to the cost of the total already mentioned makes $551,572.00 for the total cost of replacing that portion of the gas plant supplying gas in the City of Lincoln.

The engineering and interest charge of 7% is the same way in the depreciation, that is, engineering and interest costs depreciation just like all other costs, and is applied in the same way in arriving at the total value, so that the total depreciation with engineering, etc., included is $135,827.00. And the total value as of January 1, 1913 is $415,745.00.

Concerning the depreciation of engineering, etc., the engineer like the ditch digger helps to put the plant in position so that it can be used; when the plant is gone the service of the engineer, like the ditch digger, is gone. You have got to get another engineer if you want to put in another plant, so the engineers themselves just what everybody else does when the whole thing is wiped out

his service goes with it, in the end that they are all effaced
1264 together. There is a theory that I have heard of to the effect
that notwithstanding the decay of physical things the value of the service that went to designing those things was still stalking about somewhere. I haven't been able to understand that yet and have never accepted that yet; I don't think it is true.

Explaining what affect the squaring of numbers has in the conclusions reached in a valuation of this kind,—well I would say, that far reaching results like valuations like this, depend to a great degree on the failure of the mind to properly grasp the true import of variations in quantities, if the quantities are very small in themselves. On a certain principle as to the squares of numbers, I remember that James G. Blaine used to illustrate as he thought of the excise tax on tobacco by figuring out to his hearer how little it amounted to on every pipeful. Notwithstanding that a great many millions of dollars are annually collected on that tax. So that in valuing a large piece of property if you cut it up into its most minute sets of units, making each unit very small for instance, just the number of cubic feet that goes in as a foundation, or by the way of excavation under a piece of machinery. Two engineers may differ very considerably in their statements as to the quantities involved without attracting attention. Each quantity is stated to be only a few yards or cubic feet or pounds of steel, but if the quantity stated by one engineer exceeds the quantity stated by an-

other by a large percent provided the quantity itself is quite small, it often escapes attention.

The result of the differences in their prices between engineers works out, in a sense very much like the squares of the prices to which I have referred, for instance, the square root of 2 is 1.4 or 1.41 I think so that if two engineers working at a piece of work divided into very small units or basketful/s of this kind of
1265 construction,—to use a rough illustration,—and one engineer taking the excavation for example thinks the quantity is represented and takes it to be represented by 1.4 and the other engineer takes those unit prices for that kind of work as represented by 1. and as a result their valuations are going to be as 2 to 1 on that property. Sometimes it is a matter of wonderment that people could be so far apart in their final results and I think that is the way it comes about. What appears to be quite a moderate difference in unit prices plus what appears to be quite a moderate quantity in extent of value will give a very large difference in value because your valuation is the result of multiplying the quantity into the unit price.

Exhibit "232" is entitled "Age and depreciation Lincoln Gas Place as of January 1, 1913." This exhibit shows the annual depreciation percentage on the buildings, works equipment and the distribution system. Also the total depreciation in such percentage; and shows the dollars of annual depreciation on each of the classes of property, and on the entire property, referring to the totals of per cent the annual depreciation on the entire property is 1.9%; the total per cent of depreciation on the property is 24.6%; those are the percentages of depreciation up to January 1, 1913 on all of the property. That percentage, like the annual being computed on the basis of the cost of the property in every instance.

The dollars of annual depreciation as here computed is $10,914.00. In stating the annual depreciation I confine it clearly in the use of the word "total"; this is the annual depreciation on the entire equipment.

Exhibit "233" is headed: "Age and depreciation of Lincoln Gas Plant as of January 1, 1913", the same heading has been carried on to both of these tabulations, they may be considered parts of the same tabulation.

1266 Exhibit "233" sets out the assumed years of life; the per cent of annual depreciation, the age in years; and the per cent of total depreciation; for each item of property in the gas plant, beginning with the buildings and running down through the works equipment and distribution system. On the last page of exhibit "233' there appears to be omitted the heading "distribution system", which should exist over the parts of the tabulation beginning with the words "cast iron mains" I would not change the items at all but would simply make that portion of the exhibit a little clearer.

The method followed in preparing this table as to each kind of equipment has been to ascertain the year in which it was constructed or acquired and thereby determine the age as of January

1, 1913. Then to settle on the life of such a piece of equipment in this plant as nearly as might be, and divide that life into 100 to get the per cent of annual depreciation. For instance, if the life was assumed to be 50 years,—as in the case of the steel mains,—the annual depreciation would be 2%; then having the years hold, the per cent of annual depreciation is multiplied by that number of years of age to get the total depreciation in percentage; the total percentage of the depreciation, and that relation runs entirely through exhibit "233", namely; that the annual depreciation is multiplied by the years of age of the property to get the percentage of total depreciation, that is, that percentage of annual depreciation is multiplied by the years of age to get the total depreciation.

In exhibit "233" is district holder equipment," that was put in there with the idea that there might be added on some item in this valuation a valuation for that equipment on the supposition that the court might not think the position taken by the witness was sound in excluding that property. In other words I didn't consider it at all a part of the gas plant that serves the City of
1267 Lincoln, but of course I don't know what the Master and court will do with the matter, so those figures about the age and life as applied to the district holder equipment are put in to be used in connection with the set should it be added showing the value of that district holder. If such a set is not added before the testimony is closed here these figures have no bearing one way or the other, if such a set should be added such figures would have a bearing, that can be applied to any cost on that holder and other equipment, that is my opinion of the way the depreciation would work on that holder and equipment.

Exhibit "234" is a statement of the dollars of annual depreciation, the dollars total depreciation, computed on the Lincoln Gas Plant, also including the year in which each item was built or acquired, as to the buildings,—the district holder house being omitted,—and the dollars of annual depreciation is $452.78 on the building. And the total depreciation figured on those buildings is $8,216.00.

On the works equipment that existed on January 1, 1913 the total annual depreciation, including that on office furniture and fixtures, figuring that as part of the works equipment, is $2,579.69; and the total depreciation on said works equipment as of January 1, 1913 is $38,057.

The year in which each piece of works equipment was acquired is stated in the margin.

As to the various mains, meters, and service pipes shown on the last sheet dealing with exhibit "234" and forming a part of that exhibit, the annual depreciation for the entire distribution system is $6,160.00 and the total depreciation from its construction down to January 1, 1913 is figured at $80,624.00.

The method of arriving at the depreciation on the mains, services, pipes and meters, which are like in kind and vary widely
1268 in age and year of acquisition has been to take each group of such article according to the year in which it was acquired or constructed and deal with the age of that group first and then

with an average age for all the groups in obtaining the final depreciation.

Exhibit "235" is headed "Cost and value of the Lincoln Gas Plant as of January 1, 1913" and contains for each item of plant used and useful for the supply of gas within the City of Lincoln the cost of procurring, constructing and installing in complete working shape each item of plant, or an equivalent item so procurred or constructed. Said value being obtained by deducting from the said cost the depreciation shown in exhibit "234" for that item. For instance, as to the land, the first item in exhibit "235" only block 29 containing 90,000 square feet and one-half of M Street in front of block 79 containing 15,000 square feet are considered to be land used and useful by the company in the gas supply of Lincoln. That land is valued for reasons sufficiently set forth in my testimony as of January 1, 1907 at 2½ cents per square foot. For the entire group of buildings, not including the buildings at the distirct holder the estimated cost is $27,617.00; and the value $19,401.00; for the works equipment the cost is $153,550.00; and the value $116,267.00. On taking one half of the cost of the office furniture and fixtures, as testified by Mr. Lea the costs of the works equipment with office furniture and fixtures added in is $160,069.00; and the value of same is $122,004.00. The reason I take one half of the office furniture and fixtures is that the company has a large electrical as well as a large gas business, as nearly as I can see the furniture and fixtures are used indiscriminately and as far as I can judge to about the same extent in one line of business as the other, and I thought as near as I could come to it, was to allow each line
1269 of business one half of what that furniture and fixtures is said to have cost.

I have been through most of the items of works equipment in my former testimony, but I think I did not mention the 500,000 cubic foot holder, the largest single item in the works equipment. That holder was erected I think, in 1908. My method of valuing each piece of works equipment was to take the quantities of excavation for foundation given in the testimony for the company and apply the unit price of 40 cents per yard for excavation; $15.00 per thousand for the brick work and $7.00 per cubic yard for the concrete or rough stone work to get the cost of the foundation and the cost of the complete piece of equipment erected on the foundation and inclusive thereof I have fixed at what I thought was ample and sufficient and added the cost of the foundation so found to the cost of the piece of equipment found thereon in position and condition to operate.

Now in the case of the 500,000 cubic foot holder I think that the fair price of such a holder with all inlet and outlet pipe, which are very commonly although not always included in the contract, would be $75.00 per thousand cubic feet of capacity. That is, that being the cost of the holder erected in position and tested, complete and ready to handle gas on a foundation furnished by the company. That amounts to $37,500 and on top of that I have computed the cost of the foundation that the company's testimony shows exists

under that holder at to quantities amounts to $4,037.00 according to my figures, and that is the way the total cost of that holder is arrived at, which I find to be $41,537.00.

That is a good example of the process that has been followed as to each piece of machinery in the main, with the exception of the old holders and the old water gas machines as to which I sufficiently explained my process at a former hearing.

1270 The paving over the mains as shown on exhibit "235" of which the cost of the said paving is for the cast iron mains $25,254.00 and for the steel mains $9,264.00.

I would like to say a few words more in explanation of the way those figures were arrived at, and would like to refer to some photographs that I have had taken of the streets here in Lincoln illustrating the condition which as I think, warrants my estimate and assumptions that the mains if reproduced would be laid largely not underneath the paved streets but in the so called park space at the side of the streets. I refer again to the folder entitled "Data considered" and to exhibit "214" which shows the distances from the curb to the lot line along 213,340. linear feet of paved street in the City of Lincoln, being as I understand it, all of the paved streets that existed in Lincoln September 1, 1913. On page 5 of exhibit "214" taking the 30 foot distance from the curb to the lot line as one of the medium distances there are 51,150 feet, or almost 10 miles of streets, that have that distance on either side of the paving between the curb and the lot line. It appears that only about 15,000 feet of 3 miles of streets have less than 15 feet between the curb and the lot line among this entire length of paved streets in the City of Lincoln, and it is this wide and comparatively unobstructed park and open space along the paved streets that leads me to the certain conviction that it would be folly to require the mains to be laid down through this paving in case the mains were reproduced here in this city. In other words the question about which I am expressing an opinion as to whether or not in case of a reproduction of this plant a person would be required to cut through these paved streets when this ample park space exists on either side. I am clearly of the opinion that it would be inadvisable and would not be required to be done.

The photographs of streets to which I have referred are numbered exhibits "259" and "264" inclusive and show a view along

1271 the paving and the park spaces at either side of the paving in various Lincoln streets.

The streets concerned are for exhibit "259" Eleventh Street looking north near Wood Street. Exhibit "260" B Street looking east towards 20th. Exhibit "261" shows 15th Street looking south near D Street. Exhibit "262" is Q Street looking west from 12th Street. Exhibit "263" is a view looking west on D near 20th.

In exhibit "261" there is shown in addition to a substantial park space at either side of the paving a park space running along the center of 15th Street near D. I don't recall the distance that this park space follows the street, if it follows it far enough the park space itself which divides the paving into two equal parts might be

used in case any obstruction existed in the space between the curb and the lot line. The park space in the center of the street is not continuous, but as I remember on some of the streets a distance of 18 or 20 feet between the grass plots in the parked space in the center of the street, so that the side space between the curb and the lot line would be preferable to laying the mains down in the paving, or down through the paving all the way because the parked space takes up much the greater length of the street. The parked space of exhibit "261" and all of the park spaces of similar kind that I remember to have seen in Lincoln, are little if any incumbered with trees or shrubbery, so they could be used for laying mains so far as any physical hinderance is concerned. The park space I was referring to was in the center of the street.

In looking into this matter of laying mains between the curb and the lot line in the event of the reproduction of a plant like this one, I have endeavored by inquiring of local authorities and I have been informed that there is no legal hinderances. Whether informed by the present city attorney,—exactly, and the best legal authority I know of, outside of the other attorney in this case. I know
1272 the ordinance introduced in evidence but I was not able to comprehend that it limited at all the laying of mains in park spaces.

Exhibit "242" shows the "cents cost cutting and repaving per linear foot mains at 20 cents per foot", dealt with.

Exhibit "243" shows how the "Total feet to be relaid under paving" in the event of the reproduction of the main system here is arrived at. On the left hand side of exhibit "243" is shown the size of the mains in inches running from 1¼ in. to 16 inches, that being the range of sizes now said to be under paving; in the next column follows the feet of mains of each size now under paving according to the testimony of Mr. Lea, as I understand it, amounting to 188,000 and some odd feet, the addition of that column is incomplete here, but the thousands of feet which are the main part of the addition is 188 that is now under paving; and the company has to which I now express an opinion is how much of that 188,000 feet if reproduced or paralleled would necessarily or reasonably be laid under existing paving.

To solve that question I have assumed in the first instance that what is known as the business district of Lincoln, and which is defined to be, to some extend, by an ordinance as the business district, which was set out in detail in the valuation in the cost folder and gone into in my former testimony amounts to 39,080 feet of mains that would have to be relaid under paving in the streets; those relaid mains would include all of the 16 inch, the 12 inch, the 10 inch, the 8 inch, the 6 inch, and a portion of the 4 inch mains.

Now as to the remainder of the 4 inch and the mains of 2 inches and less in diameter I am of the opinion that no more than 20% would be reasonably placed under paving. It requires only a very moderate space to put down these 4 inch and particularly the 2 inch of which 95,884 feet is said to be under paving; but in my
1273 opinion not more than 20% of the remaining 4 inch and all of the 2 inch and a very small amount of 3 inch,—about

306 feet,—and all of the 1¼ inch should not be placed under paving. That allows for the crossing of streets where mains though laid in park spaces would have to cross the paving underneath and would allow for the smallest part of the lengths of the paved streets where the park spaces is so narrow and so incumbered with trees that it would be inadvisable to attempt to lay the main there. So that my purpose is to lay a few hundred feet of the 4 inch mains and 80% of the 2 inch and 1¼ inch mains and 67½% of the 4 inch mains in the park space between the curb and the side walk. Or to put it the other way: I propose to lay only 20% of the existing 1¼ to 3 inch mains under paving; and 32½% of the 4 inch mains under paving and all of the mains of larger size under paving. All of the mains of large size that are now under paving, I am talking only about those under paving now.

This is decidedly easier to lay a small pipe like the 2 inch which makes up the bulk of this length to find a place between the curb and the lot line where it can be conveniently laid as it is for 6 inch mains of the Water Department which are laid in this same space as shown in one of the exhibits included in the folder on Data Considered.

Mr. Foster: Mr. Adams has been informed that there is no law or ordinance that requires these mains to be laid under paving or kept out of the park space.

(Witness continuing:) In the matter of paving over service pipes, as will appear in an exhibit later than "235" which I am now explaining, I have allowed for paving over all the services that are assumed now to be under paving.

In the matter of service cocks and boxes I haven't allowed by way of estimating for the reproduction of anything like the number of service boxes and cocks as there are now in the City of Lin-
1274 coln for two reasons: The first and more important reason is, that such service boxes and cocks are not generally used in other places and are not considered to be necessary by gas men, or by me in particular, and are not shown to be considered necessary by the practice of this company in not putting them in their recent services as shown by their recent service card records. The box which is simply a small cast iron pipe set vertically in the ground reaching from the side walk down to the service pipe is simply a means for getting at the service cock which is simply cut into the service pipe for the purpose of shutting off the supply of gas by turning the cock when occasion requires it to be cut off from the outside. The better opinion as to the use of such cocks and necessary boxes for the cocks to make them accessible is in the case of a good sized public building where you have a good sized service pipe 2 inches anyway, running into a public building where a good many people go and that the additional safety to the public by having an outside cutoff for the gas is worth the expense and trouble of putting it there and keeping it in repair. On the other hand in the case of supplying private houses the practise is certainly against the idea of going to the expense and trouble of installing such service boxes and cocks, and the trend of that practise is well illustrated by what is being done by this company with these service boxes and cocks. For some reason

unknown to me what were at one time being installed are not now being installed here, as is also shown by the so called service cards of the company which are a record of what is installed and connected with each service when it is put in.

That is one reason for cutting down the allowance for service boxes and cocks. Another substantial reason is that all over the city the service boxes which give access to the cock which alone make their value have fallen into a state of disrepair that renders them worthless even if it were necessary to cut off the supply of gas; this cast iron barrel that runs down to the service pipe, say about 3 feet long
1275 has an internal diameter of 2½ or 3 inches and has a cast iron cover at the top usually fastened on with a screw when it is in place, but I have found they are very commonly not in place. I have found by sticking my little 6 foot pocket rule down a little way into the box that the box was very often filled up with dirt and rubbish sometimes I could see the dirt packed in the box nearly to the top. If you get that box full of dirt it is of no use whatever, you could dig up the service pipe before you could dig the dirt out of the small cast iron barrel, and property in that condition is of no use even if it was necessary to have it there for that use.

So I have given the cost and resulting value as near as I could arrive at it by a fair estimate as to depreciation for only 20% of the number of service boxes and cocks that exist in the city. Ordinarily in the installation of a gas plant your service pipes running to buildings of a character that would make service cocks desirable would be much less than 20%,—not over 10%, ordinarily,—but this is a matter of some difficulty and is bound to be one of contention and I feel like making the largest possible estimate that I could as to the number of these cocks and boxes that could be considered in arriving at the value of this plant and I have set it down at 20% of the number. I have set it down at 20% without any greater pretense, my whole belief is that anybody installing this plant today who is well advised, would never put in 1/5th of the boxes and cocks as exist here today. I am not counting the stages of delapidation, a great many of these here are not in condition to operate anyway. They are no good.

The service governors I have given the new cost at $13,375.00 and their value at $12,677.00.

The cost of the service boxes and cocks I have put down at
1276 $2,472.00 that being 1/5th of the total number, or what I consider the cost to replace 1/5th of the total number of service boxes and cocks; and the value of the service boxes and cocks is $1,854.00.

Exhibit "236" from pages 14 to 16 inclusive gives in detail the computation as to the cost of the respective buildings in the way I have already described.

Exhibit "237" shows the length of each size of cast iron mains that had been laid by the company before the year 1903, and the length laid by the company during each subsequent year down to and including 1912; to those respective lengths are applied the cost per foot, which I believe to be fair and ample for the installation of

those, and a figure at which they could be readily installed for in complete and good shape by contract if desired to do it that way. Also the cost of installing those cast iron mains in each year; we have the figure for the cost of those mains as installed in each year to which we can apply the proper percentage of depreciation. That cost is on the basis of the price on January 1, 1913, and the amount is set down as against each year when the respective pipes were laid; as bearing again on the age of the cast iron mains I refer to exhibit "237" where it appears that the cost of the cast iron mains laid by the company before 1903 was $56,954.92, and shown in the same exhibit on page 18 the cost of all cast iron mains laid by the company in the city to January 1, 1913 was $71,897.64.

In a similar way the cost of steel mains as laid in each year on the basis of the price of January 1, 1913, set out in exhibit "237½" on page 19. For the mains laid before 1903 the total cost of the steel pipe is $24,741.51 whereas the cost of all steel mains down to January 1, 1913 is estimated to be $59,026.47.

Exhibit "237 A" on page 20 shows the way in which the depreciation of the cast iron mains is figured; the depreciation
1277 being computed at the rate of 1% per year on the age of the mains according to the years in which they were laid. The estimated cost of the mains for each year being treated as one sum and depreciated according to the age of that investment as of January 1, 1913. For instance, the mains laid in 1903 are 9 years old and the investment made in those mains was 9 years old on the first day of January 1913, and the mains laid before 1903, having in mind the fact that the company began to lay its cast iron mains in 1875 or 1876 the age is taken at 23 years, being made up of 10 years,—the period from 1902 to 1912, plus 13 years or one half the difference between 1876 and 1902. The 23 years for the age of the mains that were laid before 1903, those that were laid in 1912 were not computed as having any age and no depreciation is deducted from their estimated cost.

As showing how important this matter of the age of the mains is, as affecting depreciation, in exhibit "237-A2" that the computed depreciation on mains laid before 1903 is $13,099.00 whereas the total depreciation on all the cast iron mains laid by the company in the City of Lincoln up to January 1, 1913 is only $13,865.00.

Due to the concentration of the greater part of the cast iron mains at an earlier period in the history of the company the most of the depreciation on those mains applies to those that were laid before 1903. By this process shown in exhibit "237-A" the figure for the value arrived at for the cast iron mains is $58,027.00.

The steel mains in exhibit "237-B" on page 21 are treated by the same process of depreciation, except that the percentage of annual depreciation for the steel mains, and believed to be fair to both the consumer and the company, is 2%; the cost of said steel
1278 mains as of January 1, 1913 is $14,369.00 and the value $44,652.00.

Exhibit "238" on page 22 is an important one in this valuation as it sets out the way in which the unit price per foot of mains,—both

of steel and cast iron,—is arrived at: giving the unit price for trenching, filling, carting and laying, meaning thereby, all the labor that is performed directly on the pipe from the time it is taken from the cars to finally becoming a part of the main system. The item for joining material and incidentals, and the allowance for specials which is taken at 3% on the cost of the pipe itself, that is, cost of the pipe as iron on the cars, and arriving at finally and adding together the cost of these various items at a figure which is used for the mains per foot. The unit figures for the 1¼ inch, of which there is but very little pipe, is 13½ cents; laid complete in the system and ground; 2 inch 18.6 cents; those two sizes are the steel pipe; 3 inch of cast iron pipe 30.1 cents,—all the larger sizes are now cast iron,—4 inch 36.7 cents; 6 inch 56.2 cents; 8 inch 74. cents; 10 inch 90.6 cents; 12 inch 1.235 cents; 16 inch 1.722 cents; 20 inch 2.529 cents.

The allowance for specials includes the drips and valves in the main system and the price set down here for labor, includes all of the labor that went into the system taking it as it runs,—because there are some points of difficulty,—the streets are a little bit harder in some places than others, various obstructions are encountered, sometimes the pipes of the water works, sometimes railroad crossings or street railway track to be gone under,—but my allowance is one which would cover in the aggregate and on the average the passing of all those obstructions and is ample in my opinion for that purpose.

Exhibit "239" on page 23 shows the size of trench in width, the depth of the trench and the cubic feet of earth that must be removed in digging the trench, and the cost per linear foot on the
1279 trench on the basis of 1½ cents per cubic foot removed for each size of mains from 1¼ inch to 20 inch; all these figures are as of January 1, 1913.

Exhibit "240" on page 24 deals with the important question of the fair price of cast iron pipe in this system as of January 1, 1913 and shows the estimated price per ton to be for the 3 inch $30.00; 4 inch $28.00; for the 6 inch and larger sizes $26.00.

That price is based on numerous records I have of actual purchases of pipe along here in the Mississippi Valley and purchases of pipe by various companies, also to some extent making the proper allowance on the market price of pipe as published in the Trade Journals, which is always above the price found at which large quantities can be purchased for in an actual trade. The pounds per foot is also set out in this exhibit "240," the pounds being the same as used in the valuation of January 1, 1907 and being the pounds shown in Kent's Pocketbook for the standard weights of cast iron pipe as made in 1896 by the Addyston Pipe Company and their allied companies. The weight per foot here set out, is in several sizes a little under what the pipe weighs that the company has purchased in the last few years when its purchases of cast iron pipe have been in the aggregate small as compared to what they were in earlier years. On the other hand these weights of pipe are substantially larger than I find applied to the earlier pipe purchased by the company, and in one instance where I got a purchase of pipe by this company in the year 1892. These weights here are substantially

greater than the weights there shown. These purchases of pipe are fully set out in the cost exhibits that were explained at the last hearing.

Exhibit "241" is intended to show the feet of mains existing January 1, 1903 in the Lincoln Gas System; the number of feet of each size of mains as of January 1, 1913 is obtained by taking the feet for the respective sizes,—upon the corrected testimony of Mr. Brodnax for the company in this proceeding,—and deducting there-
1280 from the amounts laid in Lincoln during the period, making an allowance also for the amounts that have been laid outside of Lincoln, as appears in the testimony of the company. I got the figures in the first instance for the mains laid in Lincoln during the period from 1903 to 1912 inclusive, from the reports of the company in its so called gas reports, or New York report. That report purports to show all the mains laid; and there has to be deducted from all the mains laid those outside of Lincoln in order to get the mains laid in Lincoln. Exhibit "241" shows the mains laid in Lincoln from 1903 to 1912 inclusive; and deducting the length of those mains laid in Lincoln from the length which it appears from the testimony of the company existed in Lincoln January 1, 1913, that computation is taken to give the feet of mains that existed in Lincoln January 1, 1903 and they were therefore laid before the year 1903.

Exhibit "245" on page 27 shows the cost of service pipes as of January 1, 1913, existing in Lincoln, and is computed by taking the service pipes that were laid before the year 1903 the number of which was 2,911, and the service pipe laid to the meter in each following year and multiplying the number of said service pipe in each year by the unit cost of $8.13 per service pipe. In that way the total cost of service pipes laid before 1903 is computed to be $23,666.43; and the total cost of all service pipes down to January 1, 1913, is $69,458.98.

Exhibit "246" on page 28 carries forward the cost of service pipes as of each year, that is, the cost of the service pipe as of January 1, 1913, and laid in each year, from Exhibit "245" and applies to their cost in their respective years a percentage of depreciation computed on the basis of the age of service pipes laid in the respective years of 2½% per annum on the cost of the pipe. That computation results in a determination on January 1, 1913; of $13,607.00 for the
1281 pipes laid before 1903; there appears on the face of the exhibit that the service pipes of 1911, which are taken as one year old and on which a percentage of 2½% of depreciation is applied. The dollars of total depreciation to January 1, 1913, on the service pipes that existed before 1903, amounts to $13,607.00 and the total estimated depreciation amounts to $19,013.00 and leaving as contrasted with the cost of the service $50,926.00 for the value, the cost being $69,939.00. In the figures last given are included 124 stub services which existed on January 1, 1913, and I take as the depreciation $19,013.00 for the services that run to the meter $50,440.00 and for all of the services $50,926.00, there is an item of $486.00 added to both the cost and value for the stub services.

A stub service is a name that is sometimes given to a service that

runs from the main to a point inside the curb so that you can connect them without cutting the paving. I don't depreciate that as the property is nearly new as near as I can judge.

Exhibit "247" sets out in detail and in the same form but not the same cost, as was set out for 1907, the cost of service pipes.

Exhibit "248" shows the estimated cost of one of the short or stub services that simply runs from the main to a point inside the curb line so as to get it out from under the paving.

Exhibit "249" is a compilation taken directly from the so called gas report of the company showing the number of services each year and the number laid.

Exhibit "250" is a compilation based on Exhibit "249" which was the number of services laid to the meter each year and that being the number that has been used to compute the cost of services laid in each year.

The practice of the company, as I understand, is to lay before a street is paved a number of short service pipes, sometimes
1282 called stub services, they pass from the main to a point inside the curb line. At a later date those short services are extended to the meter on the premises of some consumer, and in treating all the service pipes for the purpose of depreciation I have disregarded the age of those short pipes, that is, if they existed in the ground several years as mere stub services before they were extended to the meter I have disregarded that period of time and have not considered them in stating the age and computing the depreciation of the services, owing to just the way the records are it is a little easier to figure that way and it would make no material difference, as far as any assumptions there is about it it is in favor of the company.

Exhibits "251, 252, and 253" show the way in which the paving over the services in Lincoln as of January 1, 1913, is computed. The feet of mains under paving is determined to be 190,037, on the basis of the testimony of Mr. Brodnax as corrected. That gives a percent of mains under paving, taken as a percent of the whole length of mains in the City of Lincoln 41.4 percent, and the percent of services is taken to be the same percent of the total number of service- in Lincoln as the total feet of mains in Lincoln under paving is to the total length of mains, namely, 41.4% of 8,660 services.

It is estimated that it would be necessary to cut and remove 12 square feet of paving for each one of those services that were laid and at 25 cents per foot that would amount to $3.00 per service, on all would amount to $10,656.00 and that depreciated,—the cost depreciated,—at 27.1% which is the percent of the depreciation on the services taken as a whole and amounts to $2,886.00 leaving $7,764.00 for the element of value that the existence of paving over services possess in Lincoln and adds to this service and to the man who wanted to use such service for the gas business.

1283 Back of that computation lies the assumption, which I suppose is unquestionably the correct one, that the element of value added to the service pipes by the existence of the paving shrinks pro rata to the shrinkage in value of the service pipes, for

when the pipe is half gone one half the life the paving adds to it, irrespective to the condition of the paving is gone; because the company has not laid the paving and hadn't to keep it in repair, and to the man who would put in a new service pipe he would have to put in the paving whose cost would be distributed to him over the life of that service pipe, if the pipe is an old one one half of whose life has elapsed you could only afford to give one half of the cost to put the paving over the new pipe.

The cost of the meters as purchased in each year and the meters that existed before 1903, is shown in Exhibit "254," the meters are taken at 40% from list, that being the price at which they can be bought in large quantities and such as necessary to reproduce the number of meters here in this plant. The total cost of those meters is $44,936.00 as of January 1, 1913.

Exhibit "255" shows the depreciation and value all of those meters; the depreciation of meters is computed at 2½% annually and the cost of the meters purchased in each year is set down as against that year in Exhibit "255." The age of the meters is given according to the year in which they were purchased just as shown in the gas reports of the company, except as to the meters purchased before 1903, they are assumed to have on January 1, 1913, an age of 10 years representing the age they would have if purchased in 1902 pluss 13, the age that they are assumed to have on the average in 1902; making a total of 23 years; the depreciation on the meters existing before 1903 as so computed is $13,366.00; and the depreciation on all the meters computed by a like process is $16,262.00.

Then the $16,262 deducted from $44,936.00,—the cost of
1284 the meters, leaving a value of $28,674.00 for the meters alone as of January 1, 1913.

These meters must be landed here in Lincoln and erected in position and some small material must necessarily be used in the connection of those meters; some minor material that the consumer wouldn't pay for as a part of his house pipe ordinarily, although I have in mind the testimony of Mr. Honeywell about the consumer paying the cost of the connection; but I am assuming that the company did pay and does pay the cost of the immediate connections to the meter and I have assumed that cost at $1.40 per meter which on 8,326 meters would amount to $11,656.00 which brings the cost of the meters and connections up to $56,592.00.

Now the connections go with the meter so far as the depreciation is concerned and figuring the same percentage of depreciation on the meters and connections that was arrived at for the meters, namely, 36.1% there is found a depreciation of $20,429.00 on the meters and their connections, which deducted from the $56,592.00 gives $36,162.00 as the value of January 1, 1913, of the meters and their connections, and in that connection and in particular with my estimate of $1.40 to cover the freight, material and labor of setting per meter, I call attention to Exhibit "264."

Exhibit "264" is a photograph which I had recently tak*ne* of a bank of 13 meters which exist in what is known as Melick Court

at the corner of 13th and K Streets in Lincoln. This photograph was taken on November 6th; there are at that point where the photograph was taken connections for several other meters, but 13 meters are shown in the group and looked at as a fire risk it is a very bad installation. I am not concerned particularly with that but I am concerned with the cost and quality of the meter connections that are shown there in that photograph, and that quality is one
1285 without taking into consideration the other elements of cost of getting the meters from the point of shipment to its position in a consumer's residence, shows that $1.40 is all together too much if they are all as poor as those connections there. The connections there are of the old fashioned lead pipe, the newer style more commonly installed is simply composed of short pieces of ordinary gas pipe cut to suitable lengths and dimensions for installing and are connected up to the meter. I make this explanation particularly because there are a number of types of meter connections. Some connections are made by supply houses that make and sell what they call a standard meter connection, other companies make up their own out of gas or lead pipe or what not, taking the information I have been able to get the $1.40 I have allowed is more than ample to take care of the cost of the connections in addition to the freight and cartage already set out. To look over 8,000 meters and see the style of connection of each one is almost an impracticable job in a valuation of this kind, and one that would take a great deal of time, and in making up the $1.40 to cover the cost of meter connections I had to assume that the style and cost of meter connections came within certain limits and the additional information that I have gathered since then tends to make me lower it rather than raise it, but those are the figures and I haven't changed it. $1.40 is ample and sufficient for all such connections and certainly for such as are shown in the photograph I would have to reduce that a little in connection with that cost for setting meters. The relative cost of ordinary gas pipe connections as compared with lead pipe connections the gas pipe connections are somewhat cheaper and made in such quantities as they would be made in the duplication of the property here, the whole thing, the material and labor and all would be cheaper than the lead pipe connection. The lead pipe
1286 on the meters here as far as they are used like on the installation of 13 meters has a very considerable variation in the size and weight and consequent cost, they vary in length and diameter but the whole thing is not an expensive installation.

Exhibit "256" is a statement of the cost of service pipes, dividing that cost between the labor and material for the years 1904, 1907, 1908, 1909, and 1912,—those years being selected because there is set out in the gas reports of the company the total of material and labor cost in those years,—then follows the cost per foot for the labor and materials; the cost per foot for the service pipes installed and the labor cost on that pipe is 9.6 cents per foot on the average for the series of years being the highest in 1912 from 1 to 2 cents higher than in the preceding years.

Exhibit "256" shows the cost of setting meters as given in the

gas reports of the company including also as I understand it, the cost of removing meters. The reports gives only the figure for setting and removing, or at least that gives the figure headed "cost of setting meters", and owing to the way the figures are given in connection with the number of meters removed as well as the number set and from the knowledge of the way in which the work must be done the setting and removing being oftentimes, although, not always, a contemporaneous process; I am of the opinion that this cost set out in exhibit "257" amounting to $12,588.41 on 28,922 meters set represents also the cost of removing meters and that on the average is 43.5 cents.

The defendant offered in evidence the exhibits 180, 181, 182, 183, 184, 185, 186, 187, 188, 189, 190, 191, 193, 195, 197, 204, 205, 206, 201, 203, 210, 211, 212, 213, 215, 216, 220, 219, 222, 229, 230, 199, 217 together with exhibits numbered from 231 to 264 inclusive which were received in evidence.

1287 Mr. ALTON D. ADAMS, a witness for the defendant, having been previously sworn herein, was recalled for further examination in chief and testified as follows:

Examination in Chief by Mr. Foster:

I have made an investigation of the company's operating expenses, and the investigation has been concerned directly and particularly with the so called gas reports of the company, one of the record books found by me in their office and of which I have had the use. Whether those are the gas reports of repairs and operating expenses offered in evidence by the company,—I am unable to state. I have seen some of these volumes of reports in the court room and they have been referred to by the company and also by myself in the course of these proceedings but whether they have been offered or not I am not clear. I have seen the reports for the years 1903 to 1912 inclusive. Those reports are set out in very considerable detail in the statement of the company as to its expenses of operation and income in the manufacture and sale of gas. The first step in arriving at my conclusion was to copy the reports of the company entire for a very large part for the years 1908 to 1912 inclusive, and to resort to the printed record in this case for the years 1906 and 1907, and parts of the same figures for the years 1905, 1903 and 1902, and then to resort to the original copies of the report in the books of the company for the figures during the entire period from 1903 to 1912 inclusive.

For the purpose of my criticism of the company's operating expenses I have made a re-arrangement of the items shown in the company's reports, that is shown in exhibits "272" to "319" inclusive in the folder entitled "Lincoln Gas & Electric Light Company income and expense per the gas reports, and estimated income
1288 and expense per Alton D. Adams." The purpose of making this rearrangement included in the exhibit mentioned was to bring out more clearly to my mind the expenses of the company in the various operations connected with the manufacture and sale

of gas, partially for the purpose of comparing more readily the expenses of this company with others in the gas business. The general plan followed in classifying the expenses has been to obtain from the gas reports the amounts expended by the company in each year in the first instance, for material and labor, directly involved in the manufacture of gas. The next instance the salaries of officers, general office expenses, and distribution expenses, that have been brought together and classified by those so as to make a distinct group of expenses from those that are directly concerned at the works in the manufacture of gas.

Another group of expenses made up from the report is that of repairs and renewals as charged by the company; and still another item of expenses is that of taxes which I have treated or compiled separately from all the others. The reasons, briefly, for separating the expenses into these groups are about as follows: The labor and material involved directly in the manufacture of gas are matters that come directly back to the market price of materials and the market of labor. They are factors in the total expense of gas making over which the company has, only in a minor way control; that is, the company can operate the works economically or uneconomically in a way, but as a rule a company will naturally buy its materials as cheaply as it can, and it will hire its labor concerned in the manufacture of gas as cheaply as it can; so that when we found in reported gas expenses so much for material at the works and so much for labor at the works we can as a rule conclude that that money was actually and necessarily paid under the condition the company was operating, for the material and labor concerned.

That is not true in some other departments of expense that
1289 might occur in the expense report of the gas company. Take for instance the salary list, the office expense, the amount of expense incurred in an effort to secure an additional or larger volume of business. Those expenses are very largely within the discresion of the company. The company may pay its officers one salary or another and within pretty wide limits. Those salaries may not be just what is necessary to get persons who are competent to officer the company and manage its affairs.

Passing from that group of expenses to the so called "repairs and renewals" we are again at a point where a company may and does, as a matter of practise in a great many companies, exercise the widest latitude for the amount of charges for the annual expenses so called, and it is not at all an uncommon thing in gas accounts to find long extensions of large mains, gas holders, gas making machinery of various kinds, charged into repairs and renewals. On the other hand you will find the repairs and renewal items of some expense accounts of some gas companies very low, just barely enough to get just the actual repairs,—putting on the patches to keep the gas system generally in working condition. So that if one has to judge whether repairs and renewals have been the shrinkage in value on a plant or not, it is necessary to separate it from the other expenses and see how much is charged to that item. It is specifically possible that, in many times a repair may be a large extension to

the plant of a company, it may offset by its value a good deal of shrinkage in the other parts of the plant during a period of time. So that the repair and renewal item, being particularly within the control and discresion of the company as to the amount charged, it is necessary to separate them from the other so called expense item. Exactly opposite item is that of taxes. The tax exaction is one made by the government and if it proves to be legal
1290 there is no escape from it. So if we are comparing two companies as to operating expenses, it is of course, necessary before we can reach any certain conclusion as to their relative operating expenses to get at and separate the tax item. One might pay a tax of 10 cents per thousand and the other pay 2 or 3 cents, and so the tax item has been separated.

Now in a general way the expenses of the Lincoln Gas & Electric Light Company in its gas business have been classified by me in these exhibits on the line indicated, mainly to get the money reported as paid by the company for materials used in making gas: to get at the money reported as paid for labor at the gas works concerned in the making of gas, and then to get at the money reported as paid under each of the other heads that I have mentioned.

I found in looking over the expense reports of the company that the company records under quite a large number of headings,—more so than those of many gas companies with whose accounts I am familiar,—and as recorded by the company the expenses do not naturally bunch or group themselves in the way that I have indicated. In other words the company has saw fit to adopt another grouping than that I have indicated. I have so re-arranged the expenses set for each year in order to get under the respective groups the items that I considered belonged. Then again, another variation that I have made and thought proper from the company's form of reporting its expenses, has been in the dealing with the gas residuals, and the so called lost and unaccounted for gas. It is possible and perhaps illuminating and helpful to some purposes, to charge up in an expense sheet the cost of the coal and oil to make the gas and the cost of the labor necessary to charge that coal and oil into gas and the charge into the expense sheet the alleged so called cost of the coke that results from making a part of
1291 the gas and to charge into that expense sheet the so called cost of gas that may be lost and never reaches the consumer, although the money paid for the coal and the oil and the labor pays for everything that the oil, coal and labor produce, and the coke for instance, and the gas that was lost on the way to the consumer and never reaches him were all paid for at once and are charged for themselves when you charge for all the labor and all the coal and all the oil.

I have been accustomed to consider and do consider cost to be money paid or the equivalent of money paid, I consider it improper to charge up in the cost sheet the cost of coal and oil and labor to make gas and then charge also in that sheet the alleged cost of certain coke which results from the coal, oil and labor. That method of charging may be helpful for some purpose if you go on and credit

your coke out at the same time you put it in some other account but it does not and can not represent the cost of making gas, namely the amount of money that you have got to spend to make so much gas. If the coke is charged in at one price and then credited out at a different price the account would be permanently falsified,—I do not mean to suggest here that that has been done,—I am only calling attention to a number of the difficulties which may arise in attempting to make a double charge and then getting rid of it by charging it off or giving credit for it. In the manufacture of coal gas, and to an extent in the manufacture of water gas, there are certain products called "residuals" necessarily produced and they are just like the hides that come from the beef animal or the wool on the sheeps back, you do not have any particular cost to these items. The cost is the price paid for coal, oil and labor, the result is gas, coke and tar, and we can not separate any particular part of that cost and say it was the cost of tar or the cost of gas and it is customary in gas accounting to deduct the value of the so called residuals that
1292 are made in connection with the year's operation from the cost of the gas operation, more commonly from the cost of the material and labor involved in making gas and then call the remainder "cost," or words of that equivalent meaning, of making gas. That is the arrangement I have followed in dealing with these accounts, but any alleged cost ascribed to water gas tar or coal gas tar or coke is purely ficticious. I think I have described in a general way the method I have followed in dealing with and setting up these accounts and the exhibit "72" to "319" inclusive include and exhibit simply what I understand to be the correct meaning of the gas reports of the Lincoln Company. The figures as set up by me do not in amounts exactly agree in all respects with the footings exhibited by the company, but that is due to a difference in dealing with the figures or else to some arithmetical error in dealing with them, and such small difference as appear I do not now assume to say to which they may be due.

Exhibit "272" is entitled "Expense for material and labor making gas per reports of 1905 M feet of gas sold 143,690." The letter M is used with the meaning "thousand" the feet being 143,690,000, or 143,690 thousand feet of gas sold in the year 1905. This exhibit "272" is the type I have followed in classifying the labor and expense items involved in making gas from the year 1905 to 1912 inclusive, having been my practice in each year to set up against the item of expense in these the accounts which I understand the gas reports of the company show were actually expended for those items in each year; the amount, as against some of the items are not those that appear directly in the company expense, for instance, in exhibit "272" take the matter of generator fuel for water gas, that is in that exhibit is followed by no figures, no sum being set down for that, the reason for that as I understand the complete gas report, of the company for the year 1905, all of
1293 the generator fuel used in making water gas was the product of coal and labor that is already charged into the expense account, that generator fuel was coke, and the fact in the year 1905

was that the company made more coke than it needed for water gas purposes and apparently used in the manufacture of water gas simply a part of the coke that is made, so I have not made any addition charge or entry in my classification and in the account for coke expense the coke is already paid for then in the price of the coal and labor that produce the coke.

That is in that particular year. Of course if the company bought the coke to produce its water gas as it is now doing, as I understand, and as it did do in later years then the coke becomes a legitimate item of expense; but if in the year 1905 we charge in an item for coke into the expense account we have got to make a credit and take that charge out again before we get through, or we have charged as a part of the expense of producing and selling gas not only all the coal and labor necessary to produce that gas, but also the alleged cost of some coke that that same coal and labor produced. In the same way in 1905 the item of bench fuel represents simply the amount reported by the company as paid for coal used for bench fuel in that year and not any alleged cost of coke used by the company, for bench fuel because that same coke, if any, was a part of the coke produced by the coal and labor that was already charged in the expense sheet.

Dealing with the materials involved in the manufacture of gas in this way, I have added together all the materials so involved whether they were immediately concerned in the production of coal gas or in the production of water gas, the final result was the production and sale of 143,690 M feet of mixed gas, and I have included in the materials here all the sums which I understand were actually paid for the materials according to the report of the company which amounts to $58,988.51, or about 41.06 cents per thousand
1294 feet of gas sold.

The next group of items considered as shown in exhibit "272," is that of labor directly concerned in making gas. That does not include labor of general supervision, that is it does not include a portion of the general salaries of the officers, superintendent and manager of the company, but includes merely the workman and foreman at the works whose time is put in at the work supposedly, and is involved directly in dealing with the manufacture of gas there. The expense of labor in 1905 as found in this way and set down here against the item used by the company to classify its expense is $7,689.10, amounting to 5.35 cents per thousand feet of gas sold in that year. Adding together the above mentioned items of labor and material gives a total for the year of $66,687.61 or 46.41 cents per thousand feet of gas sold for material and labor used in making that gas.

That 46.41 must be noted results from the division of the entire labor and material expense of conducting that gas plant during the year by the amount of gas sold out of that, which was produced and does not therefore, reveal the whole truth, because in addition to producing so much gas which was sold, there was also produced a certain amount of coke and a certain amount of tar so that that $66,687.61 is not the cost of the gas as sold only, but the joint cost

of the gas that was sold and the coke and tar that were made, and at a later stage in getting at what we will conveniently call the cost of materials and labor required to make these three joint products and that will leave us what is conveniently termed the net cost of gas at the works, that is the net cost of the materials and labor necessary to produce the gas, coke and tar.

Exhibit "273" shows the expense for materials and labor making gas per report of 1906 thousand feet of gas sold 155,663. As already stated the compilation of the material and labor expense for all the years from 1905 to 1912 has been along the same line so that
1295 it will perhaps be sufficient if I simply read the footings of each class of expense.

In 1906 the total material expense was $74,603.10, amounting to 48.55 cents per thousand feet of gas sold. The expense of labor of making this gas was $11,451.46 amounting to 7.45 cents per thousand feet sold and the combination of these two expenses;—namely, the material and the labor expenses,—amount to $86,054.58 or to 56. cents per thousand feet of gas sold.

Exhibit "274" shows the expense of material and labor per report of 1907, thousand feet of gas sold 179,366; the total expense for material for 1907 per this exhibit is $76,413.70, amounting in cents per thousand feet sold to 42.61 cents. For labor making gas during 1907 the sum total is $14,201.31 amounting to 7.92 cents per thousand feet of gas sold, and the total of the above named items, material and labor, is $90,615.01 amounting to 50.52 cents per thousand feet of gas sold.

Exhibit "275" shows the expense for material and labor making gas per report of 1908, thousand feet of gas sold 195,391. In 1908 the expense of material making gas $70,632.81 amounting to 36.15 cents per thousand feet of gas sold. In this same year of 1908 the labor expense in making the gas was $13,441.70 amounting to 6.88 cents per thousand feet of gas sold. The total of these material and labor items for the year 1908 is $84,074.51 amounting to 43.03 cents per thousand feet of gas sold.

Exhibit "276" shows the expense for material and labor making gas per report of 1909, thousand feet of gas sold 204,284. In this year the expense for material was $64,402.18 amounting to 31.53 cents per thousand feet of gas sold. Expense for labor in connection with said material in the manufacture of gas is $8,481.64, amounting to 4.15 cents per thousand feet sold. Total of above material and labor items for 1909 is $72,883.81, representing 35.68 cents per thousand feet of gas sold. In this year it is to be noted that
1296 the item of generator *fuel* for water gas comes in at a large amount, namely $19,469.24; the reason being that the company had to buy in this year a large amount of coke for the manufacture of water gas, it having made very little coke and very little coal gas.

Exhibit "277" shows the expense for materials and labor making gas, per report of 1910, thousand feet of gas sold 210,169. The expense for materials in 1910 was $60,856.59 amounting to 28.96 cents per thousand feet sold. The expense of labor in connection with the

said materials in the manufacture of gas was $7,419.52, amounting to 3.53 cents per thousand feet of gas sold. The combined total of these material and labor items for 1910 was $68,276.11, amounting to 32.49 cents per thousand feet sold.

Exhibit "278" shows the expense for materials and labor making gas per report of 1911, thousand feet of gas sold 227,268. In 1911 the expense for materials was $60,372.22, amounting to 26.56 cents per thousand feet of gas sold. Expense of labor transforming this material into gas was $6,539.53, amounting to 2.88 cents per thousand feet of gas sold. The total of the above material and labor for 1911 is $66,911.75, amounting to 29.44 cents per thousand feet sold. This is one of the years when no coal gas was made and the labor item is correspondingly small, the fact being that in the manufacture of coal gas the labor item per thousand feet is much larger than in the manufacture of water gas, and it makes a very noticeable difference in this particular item whether coal or water gas is manufactured. In 1911 the labor item was 2.88 cents per thousand feet sold.

Exhibit "279" shows the expense for materials and labor making gas, per report of 1912, thousand feet of gas sold 234,386. This is the last year whose operations are used in the analysis I made here.

The total expense for materials is $71,706.56 amounting to
1297 30.59 cents per thousand feet sold. The expense of labor for 1912 in connection with the manufacture of gas is $7,447.27, amounting to 3.18 cents per thousand feet sold. The total material and labor items amount to $79,153.84, or 33.77 cents per thousand feet sold.

Exhibit "280" deals with the net residuals produced by the company in connection with its gas operation and manufacture during the years 1905 to 1912 inclusive. By the "net residuals" I mean, the residuals that remain after the gas making operations are complete; that is, the company in the course of its gas making operations during the year makes certain quantities of coke, part of that coke is used up after being made by the company in connection with the manufacture of gas as a fuel, the total of the amount of coke made in the first instance by the company minus the amount which is subsequently used by the company in carrying on the process found leaves the net amount of coke, or coke that the company has to sell and which it does not itself use in carrying on the gas operation.

The residuals dealt with here in these series of years 1905 to 1912, are coke breeze which is merely the small fine broken coke, of which comparatively a small amount of this breeze is produced, coke being a brittle substance it breaks up a bit and some small stuff is produced which is called "coke breeze" which is not as valuable as the larger pieces of coke, and the coal gas tar and the water gas tar.

Coal gas tar is a produced directly in connection with the manufacture of coal gas; and water gas tar so called, directly in connection with the manufacture of water gas.

In determining the net residuals, the practice followed by me as shown by exhibit "280" and which I consider to be a fair and proper one, is to find out the net amount of the residuals made by the company of each kind and then compute its value on a fair basis. It is

often necessary to do that in figuring up the expenses of the
1298 gas company for the reason that it not infrequently happens that a gas company does not find it convenient or expedient to sell all of its material produced within a particular year within exactly that period. So that at the end of the period it may have quite an amount of those residual materials on hand, or it may happen the other way that in the next year it sells more residuals than it produces. It would be incorrect to credit any year's gas operation on material and labor paid for in some other year and charged into the expense of some other year. In like manner every year's operation should be credited with the fair value of what that year produced, gas, coke or tar, whichever it may be. In the Massachusetts system of accounting that is even carried so far as to require the value of the gas in the holder at the end of the year to be stated and carried into the expense computation, and if a company happens to have a little more gas in its holder at the beginning of a year than it has at the end of its year why the cost of that excess amount of gas is fairly and properly the difference between the two amounts, if properly and fairly figured into the cost of the year's operation under consideration. The amount of gas on hand is usually a very small item compared with the amount of coke on hand in a coal gas plant, or might run into a very large amount, but the amount of gas on hand would be relatively a very small item.

Exhibit "280" is made up of a column of years running from 1905 to 1912; a column headed "net residuals"; a column headed "tons or gallons", under which the tons of coke or breeze or the gallons of tar of each sort is put; a column headed "unit value" in which is put a figure which is believe- to fairly represent the unit value of the residual under consideration for the year in question, at least is not believe- to be too high a figure. It happens that the residuals in connection with the operation of this company do not run into vary large amounts, which is apt to be the fact with a combined coal and
1299 water gas plant, because when they are making coal gas they often make only a moderate amount more than is necessary to produce the residuals that can be consumed;—particularly the coke that can be consumed;—in the water gas machinery. The residuals of tar of one sort or another, is always present. In selecting a unit value for these residuals I have — guided largely by the price the company states in its reports which it has obtained for the residuals sold or by which it has charged such residuals into its expense report, unit value. Proceeding in that way the value of residuals for the year 1905 is estimated to have been $7,306.31; for 1906, $11,690.42; 1907, $10,386.00; 1908, $4,795.77; 1909, $3,491.07; 1910, $2,727.70; 1911, $3,956.85; and for 1912 $3,335.79.

Exhibit "281" represents expenses by the gas report of the company for the year 1903 and includes all expenses, except material and labor making gas, repairs, renewal and taxes, the thousand feet of gas sold in that year was 98,343. The classification of which exhibit "281" is a type, includes, as stated in the headings that I have read, all of the expenses except material and labor making gas, repairs, renewals, and taxes. These various expenses *and* included by the

company under 18 headings, I have for convenience grouped them here in Exhibit "281" finally under the two headings: "Total salaries and office expenses" and "Total distribution and general expenses".

The total salaries and office expenses includes,—following the companies' headings,—reading, meters, collection and clerical salaries, collection office expense, delivery of bills, outside collections, general clerical salaries, general office expense, executive salaries, general supervision of coal gas, general supervision of water gas, the promoting of new business. The expenses which I have selected are combined under the heading, "Distribution and general expenses"
1300 are per company's report: "street department expenses, meter department expenses, gratuitous work, legal expenses, incidental expenses, rent collection office, rent of executive". The heads which I have just read as from the company's gas reports follow right down through the years on years from 1903 to 1912 inclusive and the classification adopted by my as to salaries and office expense, and again as to distribution and general expenses, also follows down through the series of years from 1903 to 1912 inclusive. Now taking the expenses that I have called "salaries and office" in the year 1903 amounts to $15,623.92, or 15.89 cents per thousand feet of gas sold. The distribution and general expenses in 1903 are $6,033.10 amounting to 6.13 cents per thousand feet of gas sold. The total of the above items of expense is $21,657.02, or 22.02 cents per thousand feet sold.

Exhibit "282" shows all expenses, except materials and labor making gas, repairs, renewals and taxes and for the year 1904 when 117,429 thousand feet of gas were sold. For the salaries and office expense in 1904 the total is $26,073.85 amounting to 22.02 cents per thousand feet sold. The total distribution and general expenses in 1904 was $5,666.48 amounting to 4.83 cents per thousand feet sold, and the total of the above items of expense was $31,740.73, or 27.03 cents per thousand feet sold.

Exhibit "283" shows all expenses, except materials and labor making gas, repairs, renewals, and taxes, for 1905, when 143,690 thousand feet of gas were sold. In this year the total salaries and office expense amounts to $27,062.85, or 18.83 cents per thousand feet sold. The total distribution and general expense amounted to $6,126.31, or 4.26 cents per thousand feet sold. The total of above expenses in 1905 was $33,189.16, or 23.10 cents per thousand feet sold.

Exhibit "284" shows all expenses, except materials and labor making gas, reapairs, renewals and taxes, for 1906 when 153,663 thousand feet of gas were sold. In 1906 the total salaries and
1301 office expense was $26,119.09, amounting to 17. cents per thousand feet sold; and the total distribution and general expense was $6,785.90, amounting to 4.42 cents per thousand feet sold; making a total of the above expenses for 1906 of $32,904.99, or 21.41 cents per thousand feet sold.

Exhibit "285" shows all expenses, except materials and labor making gas, repairs, renewals and taxes, for 1907, when 179,366 thousand feet of gas were sold. In 1907 the total salaries and office ex-

pense was $28,583.13, or 15.94 cents per thousand feet sold; and the total distribution and general expense was $8,329.76, amounting to 4.64 cents per thousand feet sold. The total of the above expenses for 1907 as reported was $36,912.89, or 20.58 cents per thousand feet sold.

Exhibit "286" shows all expenses, except material and labor making gas, repairs, renewals, and taxes, for 1908, when 195,391 thousand feet of gas were sold. In 1908 the total salaries and office expense amounted to $30,252.02, or 15.48 cents per thousand feet sold. The total distribution and general expenses amounted to $9,814.71. or 5.02 cents per thousand feet sold; and the total of above items for 1908 was $40,066.73, or 20.51 cents per thousand feet sold.

Exhibit "287" shows all expenses, except materials and labor making gas, repairs, renewals and taxes, for 1909, when 204,284 thousand feet of gas were sold. In 1909 the total salaries and office expense amounted to $34,149.47, amounting to 16.72 cents per thousand feet. The total distribution and general expense was $12,687.59, amounting to 6.21 cents per thousand feet sold. The total of the above items of expense in 1909, was $46,837.06 amounting to 22.93 cents per thousand feet sold.

Exhibit "288" shows all expenses, except materials and labor making gas, repairs, renewals, and taxes, for 1910, when 210,169 thousand feet of gas were sold. In 1910 the total salaries and office expense was $41,633.90, or 19.81 cents per thousand feet sold.
1302 The total distribution and general expense was $17,301.29, amounting to 8.23 cents per thousand feet of gas sold. The total of all above items for 1910 was $58,935.19, representing 28.04 cents per thousand feet sold.

Exhibit "289" shows all expenses, except materials and labor making gas, repairs, renewals, and taxes, for 1911, when 227,268 thousand feet of gas were sold. In 1911 the total salaries and office expense was $45,715.95; or 20.12 cents per thousand feet sold. The distribution and general expenses in 1911 was $23,973.67 or 10.55 cents per thousand feet sold. The total of above items for 1911 was $69,690.62 or 30.66 cents per thousand feet sold.

Exhibit "290" shows all expenses, except materials and labor making gas, repairs, renewals and depreciation, for 1912 when 234,386 thousand feet of gas were sold. In 1912 the total salaries and office expense was $46,529.20, amounting to 19.85 cents per thousand feet sold. The total distribution and general expense was $26,415.79, amounting to 11.27 cents per thousand feet sold. The total of above expenses for 1912 was $72,944.99, or 31.12 cents per thousand feet of gas sold.

All expenses, except materials and labor making gas, repairs, renewals and taxes for the period of years 1903 to 1912 inclusive, are collected on exhibits "302" and "303." Now skipping through exhibit "302," because that exhibit further illustrates expenses except materials and labor making gas, repairs, renewals and taxes of which I have been considering the details in the respective years. Exhibit "302" gives the total in dollars for these expenses in each year, thus the salaries and office expense in 1903 were $15,623.92, in 1912

they were $46,529.20; the distribution and general expenses in 1903 were $6,035.10, and in 1912 $26,415.79. Combine the salaries and office expense with the distribution and general expense giving total of above expenses in 1903 of $21,657.02, and in 1912,—skipping the intervening years,—the total is $72,944.99.

1303 Exhibit "303" gives a better idea of the way all expenses, except materials and labor making gas, repairs, renewals and taxes have changed with the increase in out-put of gas in Lincoln, because in exhibit "303" these items of expense have been reduced to cents per thousand feet of gas sold in the respective years. In exhibit "303" the thousand feet of gas sold each year is set down in the column next to the years; that is, in 1903 under "thousand feet of gas sold," we find 98,343; and in that year the salaries and office expense was 15.89 cents per thousand feet sold, the distribution and general expense was 6.13 cents per thousand feet sold, and the total of these expenses was 22.02 cents per thousand feet sold.

Coming down now to 1908 when the gas sales had increased to 193,391 thousand feet, the salaries and office expense was 15.48 cents per thousand feet sold; and the distribution and general expense was 5.02 cents per thousand feet sold, making for that year a total of 20.51 cents per thousand feet sold.

Coming now to 1912,—skipping the intervening years,—when 234,386 thousand feet of gas were sold the salaries and office expense amounted to 19.85 cents; and the distribution and general expense to 11.27 cents, making a total for 1912 of 31.12 cents per thousand feet sold, which is the largest total in cents per thousand feet sold for any of the years in this period from 1903 to 1912, a little larger than the preceeding year of 1911, for all of those items which I have enumerated.

I have included under the same heading in the different years the same items, per the gas reports of the company, that clearly appears from these tabulations, and I have endeavored to make it clear as I went along. The point I make is that the cost per thousand has risen from 1903 to 1912 about 9 cents, taking these same items as shown under the heading on exhibit "303," namely, all expenses, except materials and labor making gas, repairs, renewals and taxes,

1304 taking those items described by the sentence in each year it shows an increase in cents per thousand feet sold from 1903; dealing with those items alone, and just what those items are as classified by the company, as shown by the exhibit that I have already described in detail for each year each item that I have dealt with as coming from the company's report is set out under the name that it appears under in the report, in other words I say the company's records show that the cost has increased from 1903 to 1912 as to these particular items from 22.02 cents to 31.12 cents, these figures are in cents per thousand feet sold. Whether it would increase if you include labor and materials, would say this is following the two items right down throught the years. I am endeavoring to pick out the material in the most convenient logical way and it is not quite possible to follow that in compiling this document.

In connection with exhibits "302" and "303" just described I call attention to exhibit "304." This exhibit is a tabulation of six columns and is necessarily split into two halves.

The exhibit shows the expenses of operation of the Lincoln Company per its gas reports for the years 1905 and 1912 inclusive, in dollars, under the following headings: "Net materials and labor making gas," "Salaries, office and general expenses," total except "repairs and taxes." Then passing to the half of the table which is on the lower part of the sheet, "repairs and renewals, taxes total expense." The column at the head of the sheet is headed: "Total, except repairs and taxes," shows that in 1905 this total of all the company reports itself as having been spent, except for repairs and taxes was $92,570.46; and that total gradually increases,—skipping the intervening years,—in 1912, when it was $148,863.04.

Turning now to exhibit "305" it appears that in 1905 when the thousand feet of gas sold was 143,690 the total expense reported,—except repairs and taxes,—was 64.46 cents per thousand feet sold; and in 1912 when the sale was 234,386 thousand feet, the total expense except repairs and taxes, was 63.51 cents per thousand
1305 feet sold.

Turning back to exhibit "304" in the lower right hand column it appears that in 1905 the total reported expense was $104,643.53, and in 1912 $175,836.64. Reduced to cents per thousand feet sold the total expense for 1905 in exhibit "305," was 72.83 and in 1912 it was $75.02 per thousand feet of gas sold.

I may say in explanation as to all expenses, except "Materials and labor making gas, repairs, renewals and taxes" that an inspection of the several exhibits covering the years 1903 to 1912 inclusive,—being numbered exhibits "281" to "290" inclusive,—will show the items where the greater increase of expense has occurred. The items set out in these exhibits "281" to "290" and the items with their headings taken directly from the gas reports of the company. I have simply changed the location of the items and added them together and set them up in a different way to get my totals for different groups of items; for the purpose of proving, whether the expenses were provident or not in my opinion. In other words, I want to compare the reported expenses of the company in its gas department with the expenses of other gas companies, and in order to do that it was necessary to classify the expenses along the lines that the expenses of other companies are conveniently classified, and that resulted in the classification here exhibited. As an illustration in the change of the amounts of items during this period I will just mention one or two. In taking for instance as illustrating where an increase was made, the item of executive salaries in exhibit "281" for 1903 that item appears as $3,470.88, the items of executive salary in the year 1912 as shown in exhibit "290" is $8,917.30; in that way any item changes as it appears in the original gas reports of the company can be traced right through these tables I have made.

Taking another item "new business" in exhibit "281" for 1903 the amount there expended for that proposition is $5,578.97; and

exhibit "290" for the year 1912 for promoting new business
1306 is $19,692.64. And so I might pick out other large prominent items and follow them through from year to year, it can be done with any of those items.

I call attention to a number of exhibits which illustrate certain charges in operation and some of the data that was used, particularly in connection with the compilation of the material expense of making gas, such an exhibit is exhibit "291" being entitled "Feet of coal and water gas made yearly, from the gas reports." This exhibit "291" covers the years 1905 to 1912 inclusive and shows for each year the feet of coal gas made; the feet of water gas made; the total gas made in feet. It also shows in the right hand column the percent of coal gas made to the total make. The substance of the exhibit is brought out by this percentage column, which shows that in 1905, the first year here considered the coal gas was 35.58% of the total make. Coming down to 1908 it was a little less 25.6%. 1909 *at* was 8.98%; and since 1909 no coal gas has been made, so that all the make has been water gas beginning with 1910.

Exhibit "292" is entitled "Coke residual and bench and generator fuel per gas reports." This exhibit shows for each year from 1905 to 1909 inclusive the tons of coke residual produced in the manufacture of coal gas by that company, also the tons in a separate column of the fine coke called "breeze," which was relatively a small amount. In another column it shows the coke used for bench fuel; in another column the tons of coke used in the water gas generators in each year from 1905 to 1912 inclusive; and in the right hand column of that table for the year 1905 to 1907 inclusive there is shown the number of tons of net coke residual. That net tons of coke residual is obtained by deducting from the tons of coke residual that the company made the amount used under the benches as fuel and the amount used in the water gas generator, leaving the net tons which the company had for sale or whatever it chose to do with it.

1307 Exhibit "293" is entitled "cost of coke purchased for water gas," with entries through the years of 1908 to 1912, being considered that prior to 1908 the make of coke was sufficient to supply, and doubtless did supply, the water gas generators with what coke they required. The tone of coke used in the generators less the coke made, is shown in one column of exhibit "293"; the price per tone used as the cost of that coke in a column headed "price per ton," and finally the sum for each year representing the cost of the coke to the company. This cost of coke for each year in exhibit "293" is the cost that has been added into the expense of materials at the works,—to get the cost of materials at the works. In other wor*k*s exhibit "293" represents what I understand to be the amount of coke that the company had to buy and use in its water gas generators, and the cost of that coke,—and that is all the coke that I thought proper to add to the cost of materials so far as the water gas operations were concerned as to the price per ton used for the coke in exhibit "293" I refer to exhibit "294" where the tons of the coke actually used in the water gas generator, as figured into its expense

sheet, is also set out under the column headed, "total expense," and resulting from those two columns is a third column headed "dollars per ton expense." This expense for coke for the water gas generator runs back to 1906 in fact I assume it runs back to 1905 but I didn't get that figure when I came to make up this statement, and as I did not require it in exhibit "293" I did not go back after it to fill in exhibit "294." In 1906 and 1907 per exhibit "294" there appears substantial figures, namely, $13,000 and $14,000 in 1907 as the expense of the coke in the water gas generator. Notwithstanding the fact that I concluded that the company made all the coke that was used in the water gas generators in those years, those figures result,—I take it from the practice in keeping the gas report account,—of charging in the coke that was made in the actual gas process
1308 to the expense of making water gas; and then making subsequent deductions or credit for it, whereas I have stated what I consider the preferable method, for the purpose at least, of showing the actual expense or money paid for the gas material of only charging that coke when they have to buy the same. The main purpose of exhibit "294" is to get at the figures per ton for coke bought and the figure has been obtained by dividing the total expense for coke, so called for the water gas generator, by the total amount of coke said to have been used there, resulting in the dollars per ton expense. Those dollars per ton expense have been applied in exhibit "293" so far as I conclude that the company bought any coke for those water gas generators. It appears to me that a little was bought in 1908, 135.66 tons; and so on down to the years 1910, 1911, and 1912 when of course the company was buying all the coke it was using not making any coal gas in those three years named.

Exhibit "295" shows the price per ton paid for coal per the gas reports in several years. I have set up this price per ton as throwing light on the value of "breeze" or small fraction of the coke produced which is broken up and quite fit for steam making purposes. That coke "breeze" was taken in computing the value of the residuals remaining each year at $2.50 per ton. It will be noted that the cost of steam coal here was a little higher than that in the years where the price is noted. Then in exhibit "296" there is set out the number of gallons of coal gas tar, the amount credited for coal gas tar as a residual in computing the expense of making gas per the reports of the company, and the result in cents per gallon at which that coal gas tar was credited. Those cents being under the column "cents credited per gallon." The final or right hand column in the table was the cents received per gallon of coal tar as stated in the reports of the company. The residuals I have computed at more
1309 nearly the figures for the cents received per gallon with the cents the company credited the coal tar per gallon; although I have not absolutely followed either set of figures. The figures I have taken have been followed, the amount received being I think in each case a little under the amount received per gallon as reported by the company.

Exhibit "297" shows the gallons of water gas tar made and the expense credited for the same per the gas reports. Those credits I

have followed in making up the statement for the annual value of residuals made.

Exhibit "298" shows the pounds of coke per thousand feet of water gas made, and the gallons of oil per thousand feet of water gas made, giving the total tons of coke used and the total gallons of oil used. In the earlier years, particularly in 1905 and 1906 the consumption of coke per thousand feet of water gas made was substantially greater than in the later years; for instance in 1905 it was 45.55 pounds per thousand feet of water gas made. In 1912 it was 30.44 pounds per thousand feet of water gas made. Some change in the figures is to be expected with the improved water gas equipment that the company has installed between 1905 and 1912 cutting down the necessary consumption of coke per thousand feet of water gas made. Then as to the gallons of oil, it appears that there has been a drop as between 1906, 1907 and 1908, of between 4 cents and 5 cents a gallon of oil used per thousand feet of water gas made.

Exhibit "299" sets up in dollars the total cost of materials and cost of labor making gas, the net value of residuals, as I have computed that value, and the value of materials and labor less residuals which might, and often is called, the "net cost of materials and labor." In 1905 this net cost of materials and labor was $59,381.30 and in 1912 it was $75,918.05. The meaning of these figures is brought out more clearly by exhibit "300" entitled "expense of ma-
1310 terials and labor making gas, in cents per thousand feet sold." This table covers the years 1905 and 1912 inclusive and shows the thousand feet of gas sold yearly and then in cents the materials and the labor, the value of net residuals, and the materials and labor less residuals per thousand feet sold.

Comparing 1905 and 1912 in the matter of materials, there appears that in 1905 the materials used in making gas were actually costing 41.6 cents per thousand feet sold; and in 1912 30.59 cents per thousand feet sold,—in the period from 1905 to 1912 a drop of between 10 and 11 cents in money actually paid for materials.

Then in the "cents labor" which in 1905 was 5.35, there is a drop to 3.18 cents, or about 2.2 cents between 1905 and 1912. That is all the change that appears to be in the price of labor in those years, whereas there is a change of over 10 cents in the price of materials. Of course, those cents per material per thousand feet of which I speak, the meaning of those figures, that if each other expense had remained the same the cost of gas per thousand feet in 1912 would have been between 10 and 11 cents less than it was in 1905; just on the decline in the cost of the materials alone; whereas it appears wherever the labor went, and however the saving was affected, there is a difference of only .2 or less than .2 cents in the saving of labor between 1905 and 1912 per thousand cubic feet.

Comparing the "cents material and labor less residuals," or another way of putting it is "Net cost of labor and materials to make gas," as shown under the same heading in the company's reports between 1905 and 1912, in 1905 it was 41.33 cents and in 1912 it was 32.39 cents. The total saving was not quite as great as the saving

in materials alone for the reason that you had a net value of residuals in 1905 of 5.08 whereas that net value of residuals in 1912 was only
1.38 for the reason that in the water gas process you do not
1311 get near the residuals that you do in the coal gas; and the
coal gas process in 1905 gave a larger net residual value than the water gas gave in 1912, nevertheless there is in the cost of labor and materials a saving of about 9 cents in a series of years, the saving being in favor of 1912.

Exhibit "301" is entitled "total expense as stated in gas reports and as determined by gas reports by Adams."

The stated expense in gas reports for the years 1905 to 1912 inclusive is the final round statement of expenses as appearing in the report. That is, I have simply taken and put into that column the final round statement of expenses as appears in the reports. I have not obtained the figures for stated expenses here shown by any addition, or anything of that kind. I assumed that it was obtained by the same additions and subtractions in the reports of the company.

Now expenses per Adams I have that down for the years 1905 to 1912, the figures for expense which I think the report directly and thoroughly shows, treating in a proper way the value of the residuals produced. In the final column of exhibit "301" appears what I have called "excess of stated expenses." In 1905 this excess was $778.42, that is the company's round final figure for expense was $778.42 greater than the figures which I obtained by reclassifying the company's items insofar as I think they are proper items, and adding them up. The amount of excess of stated expense varies in exhibit "301" from year to year, the much the largest year is 1907 when the company's statement of expenses, that is, their round final footings for expenses,—was $4,776.76 more than I make the addition of the proper items; Whereas in 1912 my addition of the items were $262.15 more than the company sets down for its total expense. It is possible that some of these differences are due to a
mistake in reclassifying or readding a very considerable num-
1312 ber of items, but think they are in part, in the main, the
affect of the different treatment of residuals in the company's expense report and by myself; that is, I think that the company in charging into its expense report coke which it had itself manufactured,—well, that cost nothing in one way,—coke that was paid for when the coal and labor were paid for; I think they get the coke into the account and in getting it out again there might have been some mistake made; and the same would be so in a lesser degree on the tar. I don't think the company has credited as much for its coal tar as it actually sold coal tar for in the years when the credits were made per gallon and I think these differences are in the main due to that different treatment of residuals; but I say that maybe somewhere a mistake in addition has been made. If we had treated the residual items exactly alike and no mistake in addition had been made there should be no difference in the expenses found by my re-classification of the items, and found in the compan-'s original footings, because I am in purporting in this testimony that I am

now giving you to vary the company's expenses from what it has itself shown, I am merely undertaking to say what I think the reports fairly considered do show on their face. Of course if the company has added in some coke they ought not to add, or has not allowed enough for some tar, I am attempting to correct it, as I assume the company might correct it if their attention was called to it, but I am not putting in here at this time any estimate of my own about operating expenses the corrections that I have attempted to make are made by the facts I found in the reports, they are based on the facts I found in the reports. In other words I am merely testifying now as to what I think is the fair meaning of the figures and statements in the report itself and the differences, except for the one year 1907, are pretty small; it would not figure up very much except in the case of 1907 where it is $4,776.77.

The next exhibit is "306" and is entitled "Gas income and
1313 expense per gas reports."

This exhibit shows the years 1905 to 1912 inclusive the reported gas income of the company. This total expense as I have found by reclassifying and re-adding, the items,—which varies a little,—from the totals set out by the company, being a trifle greater in 1912. That is my expense being a trifle greater in 1912 for some reason, and somewhat less in the other years. In the right hand column of Exhibit "306" is the difference between the gas income and the expense as I have found it, giving what I call the net earnings. From Exhibit "306" these net earnings were in 1905 $68,975.50; in 1906, $60,262.96; 1907, $78,628.69; 1908, $98,657.09; 1909, $111,804.69; 1910, $108,402.53; 1911, $116,169.19; 1912, $106,326.47.

It is to be remembered that these are the net earnings which I understand the reports of the company to show, they are not my estimates of the net earnings at all, excepting in so far as I have slightly varied some items in connection with the residual account.

I have now explained sufficiently perhaps all items entering into expense except repairs and taxes. The taxes I have taken just as reported by the gas company, they are set out in dollars total Exhibit "304." According to that exhibit in the column marked "taxes" the amount for same in 1905 $2,112.00 and in 1912, was $15,260.00 a gradual increase during the period.

In Exhibit "305" appears which appears that the cents taxes in 1905 was 1.46 cents and in 1912 was 6.51 cents. I haven't varied that item at all as I understand it from what appears in the company's reports.

This leaves for explanation in the company's reports the item of reported cost of repairs and renewals. On account of the importance of the items I have set out the total of those items as gleaned
from the expense report of the company for each year under
1314 the headings there given. The repairs and renewals occur in the expense reports under the headings of "buildings, gas benches, water gas generators, other machinery, mains, service pipes, meter maintainence, and meter setting and removing." These repairs and renewals are set out as entered in the books of the com-

pany in the gas reports of the company, from 1903 to 1912 inclusive, in Exhibits "308" to "319." In Exhibits "310" to "319" inclusive the reported repairs and maintainence of the service part of the Lincoln Gas Place, as charged in the gas reports, are set out for each year. In Exhibit "309" the totals under each heading for each year are brought together so as to give the total amount charged to repairs and renewals in each year, beginning with 1903 and running down to 1912, including the setting and removing of meters which the company charges as expense for repairs and renewals during the period beginning with 1903 and ending with 1912, $104,246.08.

(NOTE.)—Exhibit "308" was withdrawn from the testimony by the witness.

This amount of $104,246.08 including $19,965.26 for the setting and removing of meters, and the total amount of repairs and renewals without the setting and removing of meters is $84,280.82. Explaining how this trouble occurred will say the company reports its expenses for repairs and renewals in connection with various accounts in the body of its gas reports, and also gives a summary near the end of the report of expenses for repairs and renewals. The summary does not agree with the addition of the figures selected from the prior portion of the report, and the conflict of figures that has just arisen between Exhibits "308" and "309" was due to the fact that I was quoting by mistake in part from the summary of repairs and renewals as it appears near the end of each
1315 annual gas report and in part from the addition of items of repairs and renewals picked out from the prior portion of the report. In dealing with repairs and renewals as the difference between the sum of the items under this heading in the different parts of the gas reports and a summary presented at the end is small. I have chosen to deal with the items actually selected from the several parts of the gas reports where they are charged to the operating expense.

Beginning with 1903 the amounts charged to repairs and renewals in total each year are as follows: 1903 $5,912.21; 1904 $8,544.68; 1905, $9,961.07; 1906 $11,555.67; 1907, $12,920.67; 1908, $8,915.99; 1909, $9,104.01; 1910 $10,721.04; 1911, $14,898.14; 1912, $11,712.60; total $104,246.08.

Reduced to cents per thousand feet of gas sold for the years 1905 to 1912 the figures are as follows: 1905 6.93 cents; 1906, 7.52 cents; 1907 7.20 cents; 1908 4.56 cents; 1909 4.46 cents; 1910 5.10 cents 1911 6.56 cents; 1912 5.00 cents. The total for the period of years 1903 to 1912 reduced to cents per thousand feet I will have to give at a later hearing I haven't the figures reduced.

It appears from these figures that the charge of the company has varied from 4.46 cents to 7.52 cents for repairs and renewals so called per thousand feet of gas sold. The charge made by the Lincoln Company, or any company, for so called repairs and renewals is merely a part of all of the sum that is necessary to keep up the value of the gas plant. The amount charged as repairs and renewals, or if the single word is used "repairs" alone, it may readily be more

than necessary to offset the shrinkage in value of the property. No words that I know of in the gas business are used so loosely and used with so little exactness of meaning as the words "repairs" and "renewals." Taking a gas company as a whole it is obvious that some sum whatever it may be is necessary to be expended on it as a structure year by year to keep it as valuable as it is or was at any particular time.

1316 Whether in these reports there should be no depreciation,—I was not trying to state what should be but what is, or what does happen. Whether with these repairs made from year to year the plant still maintains 100% of its value,—it all depends on the specified things that are d*onw* and paid for under the title "repairs," and that is just why this expression "repairs," or "repairs and renewals" is so slippery and uncertain until we get down close to the matter and examine the things that were done and paid for called "repairs." Let us take a gas property that is not extended or enlarged at all in a particular year and no complete unit of it, as a machine of some, kind, a length of mains or a gas meter is replaced; no unit is added by way of extensions or enlargements during the year. In a case of that sort there would be undoubtedly small items of expense to be denominated "repairs" that must be done and made on that property; there would be a screw loose and a small patch to be put on or, perhaps a diaphra-m to be put in the ammeter, perhaps a retort to be put in a gas bench, etc., on down the line, but at the end of the year we should have simply the unit structure; machines, mains, etc.,—that we had at the beginning of the year with no additions to them, and no one of them would have been replaced entirely. That is perhaps an illustration of a simple bare case of repairs, as such. It is very seldom that the treatment of gas property stops there in the way of repairs and renewals, but if it does stop there the property so treated necessarily has shrunk in value during the year. It is impossible to keep up the value of any physical structure to any given plain of value assuming an even range of prices of materials and labor, except by enlarging that structure. It is impossible to do it in any other way, that is, to enlarge that structure by adding some new gas meters or running another mile of main, or building a new holder, or putting in a new building, and you may put into the value in the cost of

1317 that new structure that may add enough*t* to offset the shrinkage in the value of the rest of the structures otherwise you can not keep up the value of the structure as a whole. The additions may offset the shrinkage, they may go much further than that, and often do more than offset the shrinkage; and those extensions bring us right in the heart of the matter, that the thing, called "repairs" and the thing called "renewals" are generally very much mixed and the best we can do in considering whether the gas property is of any particular date,—and I want to emphasize the point that we must select the property as of some particular date,—if we are going to show whether its value is being kept up or not; the sum expended on gas property as of any particular date, whether called repairs or renewals has all to be considered in toto; and what

we have to do is to find out if it is big enough,—basing our judgment on experience and any particular factors of that case,—to keep up the value of that structure as a whole; or if it isn't. When we find that a gas company in a particular year has charged and expended a number of thousands of dollars for things called "repairs" it does not at all follow until we investigate and find out what was done with that money, it does not follow in the first place that the value of the structure has been kept up by that expenditure; and in the second place that it has not or may not have been according to the amount expended for the so called "repairs" and according to what was done with it. But it is found in gas property, taking one with another, that about so much money in a property of a given sort,—about so much money say per thousand feet of gas sold, although you may possibly get a more accurate way of measuring it here in round dollars in relation to the capacity or extent of the plant or measured in cents per thousand feet sold, or in some other suitable way,—must be spent on a property to cover the necessary repairs and to make renewals and extensions enough*t* to take care of that shrinkage in value which we call depreciation.

1318 Dealing more particularly for the moment with the word "renewals", when a thing is renewed depreciation is taken care of once for all in connection with the particular article that is depreciated. If we renew a gas blower, the depreciation of the old blower, is finally taken care of when we get another as good and as large in place of it. And so if we want to know what additional allowance, if any, a company should have above what it has actually spent on its plant for the shrinkage in value called "depreciation" we must say in the first instance how much it has spent and what it *ah*s done with the money spent in that connection; and until we know how much has been spent on the property under the title of repairs and renewals, we are in no position at all to say that any particular sum should be added by way of further allowance for depreciation. In fact, I could *s*ite some cases if necessary, where the annual expenditure for so called "repairs and renewals" was way ahead of what was necessary to keep up the value of that property during the year. In other words when the so called expenditures for repairs and renewals actually increased the value of that plant and made it more valuable at the end of that year than it was in the beginning because they simply put in a lot of new stuff and called it "repairs and renewals", bigger and better stuff, and made it a better and bigger plant than they had at the beginning of the year. I figured here in the way I have indicated the amount they have expended on this property by the way of repairs and renewals, and have inquired to see the exact meaning of those figures set down here in exhibit "310" to "319" inclusive, a description of the exact items appearing in the gas reports for which these moneys were expended; from an inspection of these items and from what familiarity I have been able to gain of the property by looking it over it appears that a number of new and valuable things in addition to the mere putting on of patches and the tightening of

screws and hooks and such ordinary things that a number
1319 of new and valuable things were bought to replace the older things that have become as has been thought too old to be used. I think in this plant during this period of years 1903 to 1912 in the cost of repairs and maintainence we have a substantial amount of money spent to offset the shrin-age in value of the property besides what was spent to merely keep the thing going, to keep the screws tightened up. Illustrating what I said about the sum of $104,246.08 charged to repairs and renewals have been spent for actual renewals of property and putting in of new, if not bigger things, and perhaps both I refer to the gas benches exhibit "309" to a column headed "gas benches" running from 1903 to 1912. There was charged to gas benches for repairs and renewals from 1903 to 1912 $12,169.63. In 1907 $4,022.24; in 1908 $2,425.77, apart from the amounts of these charges,—which would indicate that something new was constructed or replaced at least,—what I know of the history of these benches derived in another way, leads me to conclude that the sum of money in 1907 and 1908 was mainly spent for actually new parts of gas benches down there. It would be impossible to expend any such amount of money in repairs of gas benches that pertains to the number and capacity they have at this Lincoln plant. It would be impossible to — spent that money in that way, in fact I know they did not because it is in the records and in the printed records to a considerable extent, that those gas benches were to a large extent rebuilt in those years, so that was an absolute replacement of old and more or less worn out structure and to that extent, a complete offset of depreciation as to that structure. When the old is replaced with the new, of course the depreication is offset and taken care of.

In the same way as to the column headed "other machinery" which included an expenditure during the term of years of $18,317. It would be incredi*t*able to my mind that that amount of money
was spent merely in repairs of the machinery. The title of
1320 expenditure of course does not say that it was all on repairs, it says "repairs and renewals", the point I am trying to emphasize is the fact that there is a substantial amount of actual renewals or plant included in this $104,246.08, and to the extent that there has been renewals, depreciation up to that time was completely taken care of and needs no further allowance. My opinion is that these expenditures actually made in repairing the plant, and in renewing parts of it, have while not completely, offset the depreciation as well as taking care of current repairs have materially contributed to that end. In other words shortly stated I think that this $104,246.08 represents substantially more than was necessary to merely repair the Lincoln Gas Plant during this term of years from 1903 to 1912; and represents very substantially amounts of actual new plant put in there, or as replacing plant that was already there or as an extension and enlargement of the plant, and the additional amount that should be allowed for a complete offsetting of depreciation is a matter for estimation and on that at a

little later point in my testimony I will endeavor to give the best opinion that I can.

I have covered in the main what is necessary to be said in explanation of the tabulations that I have made from the figures in the reports of the company in an effort to set up clearly and plainly just what the reports do show as to the several departments of expense, that the repairs and renewals and other classes of expense I have noted in my testimony, and I am preparing and have ne-rely an estimate of such modifications that I think ought to be made in this showing of the company's figures to cover all the fair cost of making gas, including the matter of depreciation. In that estimate I will attempt to give what I think is the fair cost of making gas here in Lincoln; as a part of that cost I should state what I believe to be the fair allowance for repairs, renewals and depreciation in toto. I do not think this $104,246.08 for
1321 instance, during this period of years is quite enough for repairs, renewals and depreciation; the company has called it,—whatever they mean by that,—"repairs and renewals", and as I understand the testimony of the company, they also claim that a further considerable sum should be allowed as so called depreciation. It is my opinion that the problem is really one problem, the sum one sum, namely, to take care of the plant and keep up its value; the plant is constantly shrinking in value and we must spent money on it to keep up that value, here is $104,246.08 spent on this value, and money spent at the rate of so much a year and so many cents per thousand feet of gas sold. Now I am going to attempt to say what in my best judgment should be added to this rate of expenditure on the plant in order to offset or make good all expenses, for repairs, renewals and depreciation. As to my expressage of opinion as to what should be set aside to meet depreciation in the absence of renewals I do not think that the talk about funds to be set aside and all that sort of thing corresponds with what actually happens in a gas business, or what is necessary to happen or which should be allowed for; that is not the way the gas business is done, by setting aside of funds. The practise is to keep up the value of your plant and increase its value if possible. It would in fact be impracticable to create any great fund representing the greater portion of the value of the plant out of depreciation money. If you are getting a large amount of money from any source, you can put a lot of it away in a fund if you want to, but if you are getting just the money that is necessary to meet current repairs and offset depreciation you must put most of that money from time to time into your plant in order to keep it a good useable plant, particularly if you are wanting some little extentions from time to time to these or new business. There is no such thing as a gas plant that runs like the wonderful "One horse shay" that goes to pieces all at once and then you have to turn around
1322 and build a new plant by some fund that was accumulated in some bank. In other words the theoretic depreciation fund actually goes into a portion of the plant from year to year. You may accumulate a few thousand dollars in a course of a few

years and then comes up a big expenditure and you must put it back into the plant again. I do no- mean to say that you can and should expend on a plant every single year all of the money that should properly be allowed on repairs, renewals and depreciation; but I do mean to say that in the ordinary run of business you will be required to spend the most of that money. You will sometimes get ahead a few thousand dollars, but you will not build up any great fund representing one half or even one quarter of the value of that plant in the ordinary run of business, not if you take your plant and keep it up as you should, but you will be constantly adding to your plant and it will absorb and keep in use the money that is contributed to offset the value of the structure that will and as soon as replace the structure that disappears from time to time. I am not much of a believer in this depreciation fund, so called, that is supposed to exist off in some bank or in the form of government bonds somewhere. I do not know of any plants that are run that way. So far as I know the hypothetical depreciation fund slips into the plant from year to year of a well managed gas company. That is into the entire existence of a plant. They must put the money into the plant as soon as they get it or there is usually enough extensions coming along so they have no trouble in keeping up the value of the plant. They do not run into that difficulty that I said I thought would surely come up with a plant that had no reasons for extensions, such a plant I told you could not possibly be kept up in value, I suppose that the result would be if the rate of dividends or interest was to be determined by the value, that the resulting dividends or interest would be a constantly decreasing amount if they were to be measured by the value of the plant.

Of course I am not saying whether they will or not, but I
1323 do say as a physical thing is a plant made up of given specific units shrinks in value necessarily and inevitably, from year to year; unless you are going to add to its units some new ones you are not keeping up the value of the composite structure.

One of the standard writers on depreciation mentions the practise of many of the English shipping companies who have a considerable fleet of boats or steamers on the oceans in different parts of the world, they are constantly charging enough depreciation off on their boats from year to year, so that the average amount at which each boat stands in the assets of the concern is very much less than the cost of a new boat, so that the value of the assets are only kept up to the par amount, we will say, by the addition of a new boat every year or two. This writer on depreciation,—Mr. Mathewson commends that practise and speaks of it as the sound method of treating the subject and it certainly seems to me to be the only method to get the approximation of the case, which are, that a physical thing does shrink in value, and if you have a composite structure like a gas plant, or a fleet of boats, you can only keep up the value of the bunch by putting new things in as the older things decline in value as I see it.

Mr. A. D. ADAMS, having been previously sworn herein was recalled and the direct examination on behalf of the defendant resumed.

Examination in chief by Mr. Foster:

Exhibit "348" is entitled "Net income in Lincoln, with net gas rate one dollar per M," that is one dollar per thousand. This exhibit "348" shows the estimated income in Lincoln with gas selling at one dollar per thousand feet, the estimated expense incurred on
1324 account of gas sold in Lincoln, and the net income resulting by deducting the said expense from the said total income derived by the sale of one dollar gas in the City of Lincoln down the years 1905 to 1912 inclusive. I have added here the year 1905 in order to get a broad basis for the figures, although I understand the ordinance in question here did not begin to operate until the later part of 1906. It may be necessary or sufficient inasmuch as all the figures are contained in exhibit "348" to read simply my conclusion as to the net income in each year that would have been derived by the sale of gas at one dollar per thousand feet.

For the year 1905 the net income resulting from the sale of gas at one dollar net per thousand feet is $48,891.53; for the year 1906 the said net income per dollar gas is $37,785.89; in 1907 the net income is $52,027.82; in 1908 the net income is $65,148.96; 1909 the net income is $82,545.36; 1910 the net income is $89,511.39; in 1911 the net income is $105,006.90; in 1912 the net income is $91,571.52.

In connection with this estimate I have assumed for present purposes in making it,—not having had time to annalize or change the reported expense for materials and labor making gas by the Lincoln Company, and not having made any change in the taxes, I have taken the reported amount in the gas reports of the company as I understand them, for the materials and labor involved in making gas and for the taxes; and as to the other items of expense, the figures I have just read are made up with the aid of my own estimates as to the proper amount of expense. If at a later date I should be required to make an annalysis of the cost of materials and labor involved in making gas, my expectation is that the net incomes which I have read for the respective years, would some or all of them be increased, becuase I do not think that I would agree to the
1325 correctness of all the items stated in the company's report of the labor and materials involved in making gas; however, according to the reports if I understand them at all as to the labor and materials involved in making gas, I simply assume those figures I do not assume tha- the sales would remain the same as reported or that they would be increased resulting from the reduction; I have also neglected that factor and have made up this estimate of the net income purely on the basis of the gas actually sold in Lincoln as shown in the gas reports, and on certain small amounts shown to have been sold outside of the city of Lincoln by the testimony of Mr. Lea for the company. To my mind a reduction of 20 cents or 1/6 the total selling price of gas, would undoubtedly produce a substantial increase in sales over the sales that have actually taken place since

1906. That is another factor which a further annalysis and computation would operate to increase the net incomes I have stated, I have made no computation as yet of that kind and the net incomes stated are the sales that are actually reported.

An increase sale of gas would increase the gross sum on account of the reduction of price as to its effect on the operating expenses,—would increase the gross sum of operating expenses which would tend to decrease slightly the operating expenses per unit of gas sold, per thousand feet of gas sold, other factors remaining equal, so that your income would be somewhat increased.

Explaining in detail how I arrive at the figures in exhibit "348," the net incomes stated as sold in Lincoln, per exhibit "348," for gas have been obtained by deducting for each year from 1905 to 1912 inclusive, the estimated expense of procurring and delivering the gas sold in the City of Lincoln or from the extimated income to be derived from that gas sold in the City of Lincoln as sold at the
1326 rate of one dollar. In exhibit "348" the income with gas at one dollar is set out for each year from 1905 to 1912 inclusive, that is, the income to be derived from such sale of the gas actually sold in the City of Lincoln and the estimated expense of producing and delivering that gas and carrying on all the operations of the company with reference to Lincoln is also set out in exhibit "348" for each year from 1905 to 1912.

In exhibit "347" the method of obtaining the gross or total income is derived from gas sold in the City of Lincoln,—is set out, and I have made no estimate as to any change in the price of gas outside the corporate limits of the City of Lincoln.

In exhibit "347" is headed "income in Lincoln with net rate one dollar per M," meaning, one dollar per thousand feet of gas sold. Exhibit "347" covers the operation of the years 1905 to 1912 inclusive, and sets out in one column the incomes actually derived by the company from the sale of gas in the City of Lincoln at the price it has been sold; another column shows the volume of gas sold each year from 1905 to 1912 in the City of Lincoln only; that volume of gas having been obtained in a way that will be later described in detail. Another column in exhibit "347" the reduction of income that would have been suffered in the City of Lincoln in each year from 1905 to 1912 if the net gas rate had been reduced 20 cents per thousand feet, that is, had been reduced from $1.20 to $1.00. These reductions at 20 cents per thousand feet sold in Lincoln are obtained by multiplying the number of thousand feet of gas sold in Lincoln by 20 cents for each year. To illustrate, in 1907 the computation shows that 178,626 thousand feet of gas were sold in Lincoln. And a reduction of 20 cents per thousand feet the reduction of income suffered in that year by the company by reason of that reduction would have been $35,725.20. In 1912 the reduction suffered by the company by a reduction of 20 cents per thousand feet in the net price of gas on a sale of 227,297 thousand feet would have been
1327 $45,459.40.

Having obtained in each year in the way stated, the reduction in income that would have been effected by a reduction of 20

cents in the net gas rate, these reductions are taken from the income actually received for gas that was sold in Lincoln in the years in question to get the net income from gas sold in Lincoln at the one dollar rate. To illustrate again, in 1907 the income actually derived by the company from the gas sold in Lincoln was $214,888.20, the reduction of 20 cents per thousand feet amounts to $35,725.20. If this reduction is taken from the actual income it leaves $179,163.00 as the income in Lincoln with gas at $1.00 in the year 1907. Again to illustrate for 1912 the method used, the income actually received by the company for gas sold in Lincoln for the year 1912 according to its reports is $273,175.93. The reduction in 1912 which would have been effected had the net rate of gas been reduced 20 cents on the same volume of sales that actually took place would have been $45,459.40, which deducted from the actual income in Lincoln in 1912 $227,716.53. The incomes with gas at one dollar obtained in exhibit "347" in the way I have just described are the incomes carried into exhibit "348" where the computation results in the net incomes on gas in Lincoln which I have already stated.

Exhibit "339" is entitled "Income in Lincoln per gas reports and expense and net income for Lincoln per Adams." This exhibit covers the operation of the gas company from 1905 to 1912 inclusive, it shows the income obtained from the sale of gas in Lincoln, only, according to the reports of the company. The expense on account of the gas sold in Lincoln, as partially derived from the reports of the company and partially estimated by myself and the resulting net income from gas sold in Lincoln at the rate it actually had been sold, not at the assumed one dollar rate.

For illustration again the year 1907 the actual income for gas sold in Lincoln was $214,888.20 the expense derived partly
1328 from the reports of the company and in part estimated by myself, in 1907 was $127,135.18 leaving as a net income in 1907 from the gas sold in Lincoln at the price it was actually sold $87,753.02; which does not take into account the reduction which would have occurred if the gas had been sold at one dollar, but take it as sold at the net price of $1.20.

Skipping the other years and coming to 1912 in exhibit "339" it shows there that the net income from gas sold in Lincoln in 1912 was $273,175.93 the estimated or actual expense combined,—to be shown more in detail later,—on account of the gas sold in Lincoln was $136,145.01, leaving a net income of the company for 1912 from the gas actually sold in Lincoln at the price it was sold of $137,030.92.

In exhibit "340" the expense incurred on account of the gas sold in Lincoln, the exhibit being entitled "Total estimated expense and expense for Lincoln, per Adams." The object of exhibit "340" is to separate the expense incurred on account of the gas sold in the City of Lincoln from the total expense of the company in its gas business some of the gas having been sold outside of Lincoln. The expense incurred on account of gas sold in the City of Lincoln is taken to be the same per cent of the total expense incurred as the gas sold in the City of Lincoln is and was of the total gas sold the percentage of gas

sold in the City of Lincoln is for each year multiplied into the total expense of the company in its gas business to get the expense incurred on account of the gas sold in Lincoln. To illustrate, in 1907 the total expense on account of the gas business, as shown by the reports of the company in part, and as estimated by myself in part, was $127,671.40. In 1907 99.58% of the total gas sold by the company was sold in the City of Lincoln, so that the $127,671.40 of total expense is multiplied by 99.58% to get $127,135.18, the expense incurred by the company in 1907 on account of gas sold in the City of Lincoln. So again in 1912, the total expense of the company in its gas business, estimated and actual, was $140,399.11; in
1329 1912 the percentage of gas sold that was sold in the City of Lincoln was 96.97%; multiplying the 96.97% into the $140,399.11, the total expense, gives $136,125.01 as the expense of the company for gas sold in the City of Lincoln.

The expense for Lincoln shown in exhibit "340" is the expense for Lincoln shown in the third column in exhibit "348." It is the expense that is used in exhibit "348" to deduct from the income of $1.00 gas to get the net income of $1.00 gas in Lincoln during the years 1905 to 1912.

Exhibit "341" is entitled "Estimate- salaries, office, distribution and general expense, and repairs, renewals and depreciation per Adams, and material and labor making gas plus taxes per gas reports."

Exhibit "341" covers the years 1905 to 1912 inclusive, it contains in one column headed "salaries," "dollars, salaries," etc., estimated salaries, office, distribution and general expense necessarily reasonable to have been incurred by the Lincoln Company in carrying on its gas business during each of the years in question. The column headed "dollars, repairs, etc., per Adams" contains the total amount necessary in each year to cover all the repairs, renewals and depreciation incident to and connected with the Lincoln Gas Plant in order to fully take care of the plant and keep it in good operating condition and to meet all shrinkage in value incident to the depreciation therein. To keep up the value of the property, that may be an equivalent expression to keeping it as good as new. I individually answer in that way, because I have in mind the fact as I have tried to say before, that the individual items of the plant can not be kept up as good as new in a machine any more than a man,—speaking of it as a total,—as an investment. A machine no more than a man can be kept as good as new or as good at all times as it was at one time, but the plant being an aggregation of items can
1330 be kept up to a given figure of value, a figure that applied to some particular period in its history,—either at the beginning or some subsequent period,—and these charges entitled "repairs," etc., that I have set as against each year from 1905 to 1912 represent the money which if expended in the Lincoln Gas Plant for repairs, renewals and extensions, or in other words expended to repair existing property and to add new property,—will amply and fully keep up its value as of any particular date. I have made the amount ample, and more than I really considered necessary, I have

made the amount more than the company has charged in its repair and renewal accounts from year to year. The company has not charged enough in its repairs and renewals accounts to keep up the value of the property in my opinion, and I have allowed somewhat more than that. I call attention to the fact that I have made my allowances as covering the items that are commonly described by those words "repairs, renewals and depreciation," because the problem is one problem,—the thing to be done is one thing,—namely to keep adding to that physical property and keep repairing it so as to keep it up to a given value, and any separation of those items is at best not quite exact, and unless it is carefully made, may lead to very serious misunderstandings, so that I prefer to treat in the first instance covering these three items, the so called repairs, renewals and depreciation, as really one item, which I consider they are in effect.

Take for illustration in this column "repairs, renewals and depreciation" the amount set opposite in 1907 is $16,142.94, which I say is more than ample if expended on that property during the year to repair, and to make such additions of new things to it as will in toto more than fully offset any loss in value due to depreciation.

Taking again 1912, the repairs, renewals and depreciation item as estimated by me here is $21,094.74, that I say is more than ample to take care of all necessary repairs, that is, the fixing up of
1331 the existing plant and all additions necessary to be made in the way of new articles and to fully offset the shrinkage in value on all the articles included in the plant during that year.

Taking the distribution system, which is a considerable part of the total plant, the pipes in the ground are deteriorating from year to year, and will undoubtedly become valueless. This item embraces things of that character, it embraces the depreciation on each part of the plant.

Whether there has been any substitution of old pipe with new ones,—I think there has been some in this plant, but I am trying to make it plain that this figure I just gave, for instance for 1907 of $16,142.94, is my estimate of the amount. Necessarily that must include additions and extensions of the plant in the way of making a larger plant,—not meaning substitutions of worn out parts with new ones,—taking that plant as it stood in 1907 the figure $16,142.94, includes what was necessarily done during the year in the way of bare repairs on the property; also in the way of renewing a main, a service pipe, or some machine connected with the property; it further includes a substantial sum for making extensions to the plant, making it bigger. In no other way as I see the matter, could the value of the property be kept up. There is just one more thing to be said in that connection and that is this, these amounts set out here for repairs, renewals and depreciation for each year are to be considered together, one year with another, that is what I have in mind for this situation; suppose it had fallen out that in 1907 a large gas holder in this plant had become so corroded and had many holes and the tank had gotten to leaking and various other things happened to it that it absolutely had to be replaced in this year,—I

am not suggesting that was the case but it might have been that in such a particular you had some large replacement to make. If that was done the amount to be expended for renewals in that
1332 year would be extraordinary for that item alone might be enough to offset the shrinkage in value of the plant because you would be taking care of a very large amount of depreciation by putting in a new gas holder in place of the old one. But taking the series of years together these figures I have given will in my opinion — more than enough*t* to take care of all repairs, renewals and depreciation.

The figures shown for the various years in exhibit "341" in the column entitled "total expense" are the same figures I have used for the total expense in the same years in exhibit "340."

Exhibit "342" is entitled, "Estimated salaries, office, distribution and general expense," and shows how the figures for these items used in exhibit "341" were obtained. Exhibit "342" covers the operation of the company for the years 1905 to 1912, and set out the feet of gas sold by the gas company in toto during those years, or during each year and the column is headed, "above expense per M feet." There is exhibited the amount of expense measured in cents per thousand feet of gas sold, that I say is all that would be reasonably necessary and more than is absolutely necessary to cover all salaries, office, distribution and general expense of this company if honestly and independently managed. The word "above" in all of these tables refers to the heading of the exhibit, or tabulation, the description of the column is so long, that putting it over that column would make an inconvenient tabulation so I put it in the heading and then used the word "above."

I want to make the basis I have gone on in estimating the total amount necessary for salaries, office, distribution and general expenses of the Lincoln Company in its gas business in each year from 1905 to 1912 a little clearer if I can. I said those figures given here were all that were necessary, and more than was absolutely necessary, to cover the said expenses with honest and independent management, and by that I mean the employment of persons
1333 here to run this gas business who are competent to run it by themselves and do not have to have somebody over them in some distant city or to have any office in any far away place but have sufficient office and sufficient equipment here to run this gas plant as a local institution, putting men here at the head of this business who are amply competent to run this business as other gas companies are run in other place- and to administer the business as competently and reasonably economical as a person who will endeavor to run the business and make a profit out of it.

The cents per thousand feet of gas sold, which I have estimated as ample and sufficient to cover the salaries, office, distribution and general expense of the Lincoln Gas Plant, are in the respective years as follows: 1905, 15 cents; 1906, 14½ cents; 1907, 13½ cents; 1908, 13 cents; 1909, 12½ cents; 1910, 12½ cents; 1911, 12 cents; 1912, 12 cents. These respective cents per thousand feet in the several years are multiplied into the thousand feet of gas sold in those

years, resulting in the following total expenses for those items, namely: the salaries, office, distribution and general expense of the Lincoln gas business. 1905, total expense , $21,553.50; 1906, $22,-281.14; 1907, $24,214.41; 1908, $25,400.83; 1909, $25,535.50; 1910, $26,271.15; 1911, $27,272.16; 1912, $28,126.32.

It may be well at this point to call attention to the radic-le difference existing between the figures I have just estimated for all necessary salaries, office and distribution and general expense, in connection with the Lincoln gas business; and the expenses shown in the reports of the gas company for the same years in connection with that business.

Taking as an illustration the year 1907, I have estimated that 13½ cents per thousand feet of gas sold, all that could be reasonably charged and all that it would reasonably cost to cover the sal-
1334 aries, office, distribution and general expenses during that year. In exhibit "303" it appears that the charged of the company for those same items in that year instead of 13½ cents was 20.58 cents. These items in that year I estimated to amount in dollars to $24,214.41 whereas exhibit "304" shows that the company charged in that year for these items of expense $36,912.89. Taking again the year 1912, I have estimated that 12 cents per thousand feet is ample to cover all salaries, office, distribution and general expense, in connection with the company. In exhibit "303" it appears that the company has charged 31.12 cents for those same items of expense. My estimate of 12 cents on the gas sold in 1912 amounts to $28,126.32, which I say is ample, measured by the experience of other companies, or from any standard of measurement that I can think of, to pay all of the said expense in connection with the Lincoln gas business if honestly and independently managed, whereas it appears from exhibit "304" that the company in connection with its gas business in 1912 charged up to these same items $72,944.99.

Exhibit "343" is entitled "Estimated repairs, renewals, and depreciation expense". This exhibit covers the years 1905 to 1912 inclusive, shows the total thousand feet of gas sold by the company in each year; my estimate of the cents per thousand feet, which is more than ample to take care of all repairs, renewals and depreciation, and the result of multiplying that estimate in cents per thousand feet into the quantity of gas sold, giving the dollars which I say is more than sufficient to get all the repairs and renewals and depreciation on the plant. I have used a uniform number of cents to the period of years stated, because in treating this matter of repairs, renewals, and depreciation, we must recognize that so far as,—particularly if renewals appear as an actual expense,—coming irregularly, the amount of actual renewals in different years will vary very considerably
1335 so I have taken here and used as the amount that is more than sufficient for all these expenses 9 cents per thousand feet of gas sold. In some years it would be impracticable to apply in any necessary or desirable way the amount represented by that 9 cents to the physical property of the company to improve and extend it or repair it, in other years more than that would be wanted, by taking

the group of years together and that is the way we must treat the betterment to a large physical property and the care and upkeep of it, the 9 cents which I have taken in each year, taking the years together, will fully and more than fully take care of all the items of repairs, renewals and depreciation.

In each year from 1905 to 1912 inclusive as shown by exhibit "343", I have allowed 9 cents per thousand feet of gas sold to cover the repairs, renewals and depreciation and that 9 cents is multiplied by the thousands of feet of gas sold to get the total amount in dollars, which is more than ample to take care of all repairs, renewals and depreciation of the Lincoln plant year by year in considering these years together. So that I may not be misunderstood I repeat that some years these items would absorb more money that the 9 cents amounts to in that year, the test of the correctness of the allowance would be taking a considerable number of years along, and I would say most positively that the necessary repairs and the actual renewals and sufficient additions of new things to offset the shrinkage in value of the old things all added together would not amount to more than 9 cents per thousand feet sold during that series of years.

In that connection I call attention to exhibit "307" which is entitled "Expense repairs and renewals per gas reports". This exhibit "307" gives year by year, beginning with 1903 and running down through to 1912 inclusive the amount of money in dollars that the company has actually charged in its gas reports into its operat-
1336 ing expense to repairs and renewals of plant during the period of years in question as shown in exhibit "307" the company has charged $104,246.08; during that same period of 10 years the company has sold 1,763,989 thousand feet of gas according to its reports, and dividing that number of thousand feet of gas into the $104,246.08 gives us the average amount of money expended and reported by the company during that series of 10 years as expenses on its plant, either in repairing existing articles or buying new articles, amount to the sum of 5.91 cents per thousand feet of gas sold. That sum is not sufficient to cover the repairs and to make enough renewals and extensions of the property to maintain its value as of any particular date. I have allowed 9 cents per thousand feet of gas sold as the figure to be used to amply cover repairs and renewals and depreciation against the 5.91 cents which the company has charged in its reports for the cost of repairs and renewals. Undoubtedly a very substantial part of that 5.91 cents per thousand feet of gas sold during this 10 year period was absolutely expended for new property,—not for putting on patches or repairing existing pieces of equipment,—but for absolutely new property either by way of renewals or extensions, I don't think it went to increase the value of that plant because the bare repairs of a plant of this character running along from year to year,—and by bare repairs I mean just keeping the existing articles in operating condition without reference to their absolute renewal which takes care of depreciation on that particular article when it occurs,—the bare repairs are substantially less than 5.91 cents which we find to have been expended during this 10 year period, I have allowed 9 cents as an ample sum for all repairs, re-

newals and depreciation. The total of this 10 year period on repairs is $104,246.08; I haven't completed my computation to show
1337 what my 9 cents would amount to, but it will be a substantially larger sum. I call attention to the amount of depreciation which is computed and allowed on this gas property connected with my valuation of the plant.

Up to the first of 1907 I computed a total depreciation of the property of $82,975.00 as shown by the schedule filed in my exhibit in connection with my valuation, whereas up to 1913 the first of the year I showed a total depreciation of $135,827.00, the difference between those two an increase in depreciation of the property of $52,852.00 during that years from 1907 to 1912 inclusive. During that same period of years the sales of gas was 1,250,864 thousand feet, amounting if divided into the $52,852.00 increase in depreciation to 4.22 cents per thousand feet of gas sold for depreciation only, and the difference between that 4.22 cents and the 9 cents which I have allowed as covering the repairs, renewals and depreciation, is substantially more than is necessary to take care of current repairs under the 9 cents for the depreciation should I have underestimated the depreciation in valuing the property, because the depreciation I have estimated as occurring to the property beginning with 1907 to the end of 1912 was only $52,852.00 amounting to 4.22 cents per thousand feet sold during that same period.

In this explanation of exhibit "343" I might mention the amount of money in dollars shown by estimate to be necessary on the basis of 9 cents per thousand feet of gas sold to take care of all repairs, renewals and depreciation in the Lincoln gas plant. I will state these dollars for several of the years, calling attention to the fact already stated that the sum actually necessary to be expended in that particular year for renewals is not intended to be measured by this statement but rather the sum necessary to be expended on the average over a period of years for repairs renewals and depreciation.
1338 In 1907 the allowance of 9 cents per thousand feet of gas sold amounted to $16,142.94; in that same year the company charged to repairs and renewals on the plant $12,920.67.

Taking another illustration from 1912 my allowance on the average for repairs, renewals and depreciation at 9 cents per thousand feet of gas sold amounted to $21,094.74, the company charged for repairs and renewals in 1912 $11,712.60; that charge works out in 1912 at just 5 cents per thousand feet of gas sold,—my allowance is 9 cents for repairs renewals and depreciation on all existing plant.

The figures for the various years from 1905 to 1912 in the total "above expenses" in exhibit "343" are the figures used by me in exhibit "341" under the heading repairs, etc. per Adams".

Exhibit "344" is entitled "Estimated salaries, office, distribution and general expense, and repairs, renewals and depreciation per Adams, and materials and labor making gas plus taxes, per gas reports in cents per thousand feet sold." Exhibit "344" covers the years 1905 to 1912 inclusive, shows the total thousands of feet of gas sold by the company in each year at the estimated dollars, office, distribution and general expense per thousand feet of gas sold in each

of the said years, for repairs, renewals and depreciation per thousand feet of gas sold in each of the said years, and then states the reported expenditure for materials and labor making gas per the reports of the company, and the taxes paid by the company. The total of these three items of expense per thousand feet sold, is carried into the final column in exhibit "344" "total expense" and this total expense amounts in cents per thousand feet sold to the following for the respective years: in 1905, 66.80 cents; 1906, 76.25 cents; 1907, 71.19 cents; 1908, 66.38 cents; 1909, 59.38 cents; 1910, 56.65 cents;
1911, 53.36 cents; 1912, 59.90 cents. This estimate of total
1339 expense is made up of my estimate of all necessary salaries, office, distribution and general expenses, and my estimate of the sum that is more than necessary to cover the repairs, renewals and depreication plus the amounts reported by the company as expended for materials and labor in the operation of making gas and plus the reported taxes.

Exhibit "345" is entitled "Reported income and expense for gas sold in Lincoln only". The word "income" should be dropped from the total of exhibit "345" its inclusion there is a mistake, leaving the heading of the exhibit to read: "Reported expense for gas sold in Lincoln only". Exhibit "345" covers the years 1905 to 1912 inclusive and shows for each year the total gas sold in thousands of feet; the thousands of feet sold outside of Lincoln; the resulting thousands of feet of gas sold in Lincoln, that is, in the city limits of Lincoln; the per cent of total gas sold, that is sold in the City of Lincoln, the total gas expense and the expense for Lincoln, on the basis of the percentage of gas sold in Lincoln for each year. The percentages of gas sold in Lincoln as shown in exhibit "345" are the same percentages used by me in exhibit "340" in the column "per cent expense for Lincoln".

Exhibit "346" is entitled "Total income per gas reports and income outside of Lincoln per Lea". It covers the years 1905 to 1912; shows in one column the dollars total income from the gas business taken from the gas reports of the company; in another column the income outside of Lincoln, which was obtained from the testimony of Mr. Lea; and in the final right hand column the income of sales of gas in Lincoln obtained by deducting the income of gas sold outside of Lincoln from the total reported income.

Exhibit "349" on page "A" of the folder entitled "Other gas rates and expenses compared with Lincoln gas reports" and is entitled "All
expenses except materials and labor making gas, repairs, re-
1340 newals and taxes for plants selling 100 million to 300 million feet of gas annually per sworn returns to the Massachusetts Gas Commissioners, cents per M feet gas sold".

Objection made to the exhibit for the reason that there is no sufficient verification, no proper foundation laid, no basis for comparing, and no similarity of conditions shown between the markets and operating and labor conditions and materials and supplies in the district in which the Lincoln Gas Company operates and the district mentioned in the exhibit, and the original data upon which the tabulation is made is not before the court or subject to cross examination or verification.

Referee: The objection I think is a serious one, I will receive the evidence however. It seems to me that the objection is a very dangerous one if I conclude the testimony is not competent I will not consider it and will so state in the report. The Plaintiff excepts.

(Witness continuing:) The data shown in exhibit "349" has been taken from certain public records of the Commonwealth of Massachusetts known as the returns to the Masachusetts Gas and Electric Light Commissioners. These records are kept in the office of that Commission, a public commission of the Commonwealth of Massachusetts and are treated as public records, namely, open to any one who comes at suitable times and in a suitable way to inspect and make copies or otherwise properly use them. They are not permitted to be removed from the custody of the Commissioners in which they rest. These so called gas returns are returns required by the Gas Commissioners of Massachusetts to be made to the Commissioners annually on printed forms supplied by the Commissioners to the gas companies for this purpose. The printed forms being composed of various printed questions or entries which are intended to be filled out by the gas companies that are required to make the returns.

1341 The system of obtaining these returns from the gas companies has been going on in Massachusetts since the year 1885 when the first return was required and obtained from the gas companies over the Commonwealth, and there are in the possession of the Gas Commissioners of Massachusetts a continuous record represented by those returns of the Gas companies from 1885 to June 30th, 1913. The returns are made for years ending with any statement of years that I may make in reference to data derived from these returns to the Massachusetts Commissioners namely: that the data is for years ending June 30th. I have here in Lincoln a copy on the original form of one of these returns of one of these companies which can be produced here, which is on the printed form required by the Commissioners, of course it is not the original return for the company in question but a copy of that original return. They have extra copies of these forms and I simply obtained one for this purpose.

I have resorted extensively to these returns in the office of the Massachusetts Gas Commissioners to aid me in forming an opinion among other things as to the amount of costs to the Lincoln company for the various salaries, office, and distribution and general expenses of the Lincoln Company, apart from its cost of materials and labor involved in making gas and apart from its taxes. I have also resorted to these Massachusetts returns very considerably, for any year, as the basis of forming an opinion on the subject of necessary amounts for repairs, renewals and depreciation, so that my opinion on both of these branches runs back largely to the facts disclosed by the returns in the hands of the Massachusetts Gas Commissioners.

Returning now to exhibit "349" headed "All expenses except materials and labor making gas, repairs, renewals and taxes for plants selling 100 million to 300 million feet of gas annually," I have made up this table to aid in forming an opinion as to the fair and necessary amount as measured in the first instance by cents per

thousand feet sold, to be charged by the Lincoln company
1342 for the items of expense in conducting its gas business not enumerated in the heading of this exhibit "349"; the items of expense enumerated in this heading not being here considered. The tabulation has been made up from various companies in various years, when between one hundred million and three hundred million feet of gas were sold particularly because those limits includes the annual sales of the Lincoln company, about 1906 or 1907 and up to 1912, so that the exhibit shows as to the cost of the items of expense under consideration with other companies when sales of such volumes of gas annually as have been sold approximately in the years 1906 to 1912 here in Lincoln.

For instance, to illustrate, in 1906 the Lincoln company sold $153,663 thousand feet of gas, exhibit "349" shows that the Haverhill Gas Company back in 1903 sold 153,068 thousand feet of gas and that various other companies sold amounts just above and just below that. The charge of the Haverhill company for all expenses except those enumerated in the heading of exhibit "349" was 10.36 cents an amount substantially less per thousand feet than I have here for the expenses under consideration in Lincoln in the year 1906.

Taking the year 1907 when the Lincoln company sold 179,366 thousand feet of gas, and turning to exhibit "349" in the column headed "thousand feet of gas sold," we find the Haverhill company in 1906 sold 170,759 thousand feet of gas at an expense for the items under consideration of 10.44 cents per thousand feet.

The Charlestown Company in 1904 sold 179,798 thousand feet of gas at an expense for the items under consideration of 12.16 cents per thousand feet sold. Charlestown again in 1910 according to exhibit "349" sold 238,229 thousand feet of gas at an expense of 11.40 cents per thousand feet sold for the items under consideration. That corresponds very near in volume of sales to the Lincoln company in 1912 when 234,386 thousand feet of gas were sold at an expense of 31 and a fraction cent- per thousand feet of gas
1343 sold for these same items of expense. Taking the largest sale included in the tabulation in exhibit "349" at the foot of the column headed, "M feet of gas sold," we have the Lynn plant which sold 283,578 thousand feet of gas at an expense of 8.37 cents for the items of expense under consideration, it cost 31 and a fraction of a cent here in Lincoln in 1912. Exhibit "349" is, with the exception of the Haverhill Company which will be added, a compilation and selection of which run through the year 1900 to 1912 and show a great variation in the sale of gas and exhibit "349" was picked out from these exhibits as a convenient compilation that would show the expenses under consideration for the range of sales of gas annually that occurred here in Lincoln since 1905. My deduction on page "A" not taken from the items embraced on the subsequent sheets of the folder it is simply a compilation with the object of showing an increase of out-put of gas and the accompanying sets of expense, and those pages from 1 to 10 inclusive were taken by

me and my assistants under my direction from the records of the Massachusetts Commission.

Exhibit "350" is headed "Cambridge Gas Light Company, all expenses except materials and labor making gas, repairs, renewals and taxes for sworn returns to Massachusetts Gas Commission."

Before going further with the explanation of exhibit "350" I might explain as to the heading, that there is this variation from the expense as exhibited in the sworn returns to the Massachusetts Gas Commissioners, the returns wrongfully include the item of bad debts as an expense. Bad debts is not an expense, I have several times in hearings before the Commissioners of Massachusetts called attention to that; the amount is small but it is not properly an expense, it is not included as an expense in these tabulations. To illustrate, suppose a concern makes and sells a certain amount of gas in a year and pays out money on materials and labor and all the expense of making and selling that gas and delivering it is $100,000.00,
1344 it pays that out in money, suppose then that they bill that gas out at $150,000.00 the whole yearly volume; now suppose further that through some misadventure they do not get paid for any of that gas and the consumers all fail and go into total bankruptcy, say, if they are going to charge their bad debts into their operating account the operating account in that year will show $250,000.00 as the cost of gas, when as a matter of fact they spent $100,000.00. The Massachusetts Court says, "cost is money paid," and that is the principle I have gone on in making this compilation. I have left out the bad debts and that is the only variation from the Massachusetts accounts.

Exhibit "350" shows all the reported expenses except materials and labor making gas, repairs, renewals, and taxes of the Cambridge Gas Light Company in each of the years 1900 to 1912 inclusive. These expenses I have divided here into two groups, calling one "salaries and office expense" and the other "distribution and general expense." I do not set anything in particular by those two groups, they are simply approximate divisions of the accounts,—I might have adopted some other, but I though these were more convenient to bring out the nature and extent of expenses such as are described by the heading of exhibit "350."

In the right hand column of exhibit "350" I give the really crucial figures for each year, namely, the total of the expense described,—it is perfectly possible for the total to be made up of sums charged in a different ways by different companies under the different subheadings, and that is why the division into salaries and office expense so called and into distribution and general expense is only an approximate division which is more or less convenient and gives some fair idea of the way the expenses are divided.

1345 Exhibit "350" is intended to go with Exhibit "351" which relates to the Cambridge Gas Light Company and is headed "All expenses except materials and labor making gas, repairs, renewals and taxes per sworn returns to the Massachusetts Commissioners cents per M feet gas sold." Exhibit "351" like Exhibit "350" covers the years 1900 to 1912 inclusive, shows the thousands

of feet of gas sold in each one of those years; then sets up the cents of expense obtained under each one of the heads mentioned by dividing the dollars total in Exhibit "350" in each column by the thousand of feet of gas sold in the year in question, so as to give the cents per thousand feet sold in each year in Exhibit "350" the total expense is shown in the right hand column of Exhibit "351" and for the Cambridge Gas Light Company in 1900 was 11.83 cents; in 1912 it was 12.82 cents and in the intervening years it fluctuates in the neighborhood of those figures. Taking the year 1900, which in the case of the Cambridge company is the nearest year in the matter of out-put of gas that I have here recorded, the total expenses except materials and labor making gas, repairs, renewals and taxes of that company was 11.83 cents per thousand feet of gas sold; the sales of that company in that year being 276,284 thousand feet.

Referring to Exhibit "352," as previously stated by me, the figures in each of these exhibits showing expenses were obtained from the sworn returns to the Massachusetts Gas and Electric Light Commissioners and from no other source whatever.

Exhibit "352" is to be accompanied by and understood with "353" both of those exhibits show the operation of the Charlestown Gas & Electric Company.

Exhibit "352" is entitled "All expenses except materials and labor making gas, repairs, renewals and taxes per sworn returns to Massachusetts Commissioners." In this exhibit which covers the years 1900 to 1912 inclusive the total of the above described
1346 expenses mentioned in the heading, is set out for the company in each year and the same division approximately into salaries, and office expense so called, and into distribution and general expense so called, is made. This division, is only a provisional and approximate one, and may not represent,—I want to lay stress on that point may not, and probably does not represent as to the different companies,—the same items. It is not to be expected that a large number of gas companies are going to charge the same items under the same headings. Take for instance the column "salaries and office expense," I have included from the returns of the company just the same items for each company in that column, it is quite possible and to my mind probable, that the companies in keeping their books as they are required to do in a form prescribed by the Massachusetts Commissioners may have charged not quite the same items under the headings that I have denominated "Salaries and office expense" and the same holds true as to the items I have collected under the heading "distribution and general expense"; I have collected the same items for each company for each year under that heading; but the different companies may not have charged the same items into the same place, but that does not matter for our conclusion because this table affects my judgment and I rely on it by reason of the amounts exhibited in the right hand or total column so that any difference of classification of those accounts becomes of trifling importance because they are all in the right hand column whatever heading the company has kept the accounts under.

In other words the classification in the first two columns "salaries and office expense" and "distribution and general expense" is to some extent arbitrary in the judgment of different bookkeepers, but the column headed "total of above expenses," including the items set out in the heading of the exhibit does include all of the expenses of those companies other than those excluded in the title of
1347 the exhibit precisely. It includes everything that the companies have charged and reported in their sworn returns except what they said was the cost of materials to make gas and the cost of labor to make gas or to use the exact language of the Massachusetts returns "labor at the works and repairs, and renewals and taxes;" they are separately set out under different heads in the Massachusetts returns as will appear when I bring in the copy of one of those returns.

As to the Charlestown company in Exhibit "352" in 1904 that company sold 179,798 thousand feet of gas, or very nearly that sold by the Lincoln company in 1907. The Charlestown company for all the expenses I have described in this connection, in 1904 charged in its sworn return the sum of $21,873.00 and that divided by the 179,798 thousand feet of gas sold amounts to 12.16 cents per thousand feet,—a less sum that I have allowed in 1907 for the Lincoln company in fact I have intended to make a liberal allowance for the Lincoln company and more than would be allowed strictly on the basis of this showing here on these foreign returns. In 1912 the Charlestown company again charged for all expenses under consideration $27,358.00 on a sale of 256,869 thousand feet of gas, amount by division to 10.25 cents per thousand feet sold.

Exhibits "354" and "#355" give in toto the cents per thousand feet sold, all expenses except materials and labor making gas, repairs, renewals, and taxes of the Lawrence Gas Company as returned to the Massachusetts Commissioners for the years 1900 to 1912 inclusive.

In the year 1902 the Lawrence Gas Company returned to the Commissioners an expense of $32,065 for the items here considered on a sale in that year of 184,256 thousand feet of gas, or about that sold by the Lincoln Company in 1907 that total amount of reported expense amounts in that year to 17.4 cents, an amount larger than I have allowed the Lincoln Company.
1348 In 1903 the expense of the same company was down to 12.2 cents per thousand feet of gas sold. Following down from 1902 the Lawrence Company in 1903 shows a sale of 236,808 thousand feet of gas sold at a total expense for the items under consideration of 12.2 cents. I think that is the nearest year to the sales in Lincoln in 1912. In some of the years the Lawrence company is down below 11 cents for these total expenses under consideration as shown by the tabulation.

Exhibits "356" and "357" show the returned expenses of the Lynn Gas and Electric Light Company to the Massachusetts Commissioners for the years 1900 to 1912 inclusive. The Lynn Company selling a large volume of gas. By reference to exhibit "357"

the smallest sale I have here is the one of 1900 which was 183,843 thousand feet of gas sold which is, therefore, the nearest figure I have for the Lynn company for the sales of the Lincoln company in 1907. On that sale in 1900 of 183,843 thousand feet of gas sold the Lynn company reported a total expense for the items under consideration of $13,572, amounting to 7.38 cents per thousand feet sold. An amount very much less than what I have allowed the Lincoln Company in my estimate. To get a figure approximating the sales of 1912 of the Lincoln company we have to take the year 1902 for the Lynn company when the sales were 224,514 thousand feet and on those sales the total reported expense for the items under consideration was $19,680.00 amounting to 8.76 cents per thousand feet of gas sold. The Lynn company reports a low expense for the items under consideration for the entire series of years from 1900 to 1912. The highest is 11.16 cents per thousand feet sold and anything like as that occurs in only one year. The expenses reported by this company are exceptionally low just as those reported by the Lawrence company was exceptionally high, at least I used the word "exceptionally" there to mean in the case of the Law-
1349 rence Company is some of the years I have shown, higher than I should consider reasonable. In the same way in the case of the Lynn company the expenses are lower than I should think proper to require the Lynn company to come down to. I do not mean to set up any of these companies as an exact standard by which I weight it but I do say that a consideration of these figures has aided me very materially in coming to the conclusion I have in reference to the fair expense to the Lincoln company. Some of these figures are lowere than I should suggest, and some of them higher.

Exhibits "358" and "359" show the reported expenses of the Taunton Gas Light Company, Taunton, Massachusetts, covering all expenses except materials and labor making gas, reparis, renewals and taxes, for the years 1900 to the year 1913.

The Taunton Company is a rather small one, its largest sale of gas which was in 1913 is distinctly less than that sold in Lincoln in 1907. In 1913 its sale of 136,492 thousand feet, on it the reported expenses for all items under consideration was $17,984.00 amounting to 13.17 cents per thousand feet sold. All the other years of the Taunton Company show a still smaller output of gas somewhere the output was down below 100,000 thousand feet of gas show a large expense per thousand feet.

Exhibit- "360" and "361" show all expenses except materials and labor making gas, repairs, renewals and taxes of the Haverhill Gas Light Company per sworn returns to the Massachusetts Commissioners for the years 1896 to 1907 inclusive. During this period of years the Haverhill Company was constantly much below the annual sales of the Lincoln company but in 1906 and 1907 the Haverhill company approximated in sales to the sales of the Lincoln Company at that time. In 1906 the Haverhill company sale was 170,759 thousand feet of gas, this a reported expense for the items under consideration of $17,836.00 amounting to 10.49 cents per thousand

feet of gas sold. In 1907 they sold 182,359 thousand feet of
1350 gas at a reported expense for the items under consideration of $22,376.00 amounting to 12.27 cents per thousand feet of gas sold. For the sale of 1906 and 1907 I have allowed more than either one of those figures for the Lincoln company.

Exhibit "362" is a compilation made by mer from Brown's Directory of Gas Companies. Brown's Directory is considered a standard book of reference concerning gas companies; it is a book published annually by Mr. Brown of the Gas Age and has been published annually since about 1885. It is the only book that I know of dealing generally with gas companies throughout the United States. The information contained in that book is understood by engineers to be derived by Mr. Brown from correspondence with the various gas companies. (Interrupted.)

The plaintiff moves to strike out the answer as hearsay no proper foundation laid and volunteered by the witness as to what the source would be. Overruled. The plaintiff excepts.

(Witness continuing:) This book is generally resorted to by engineers in connection with gas matters; it is the only available source of information, and is generall- accepted as authority for the matters contained in it. It is not categorically accurate the companies apparantly do not report or at least Mr. Brown does not publish in his reports detail operating expenses and that kind of things but he does give a variety of figures, and most of the gas companies have a copy of the book and keep it for their information as to what other gas companies are doing. This is for the year 1908, and will show the figures for 1907, most gas engineers keep a copy of this book.

Exhibit "362" is entitled "Thousand feet of gas sold in the year 1907 and net rate per thousand from Brown's Directory of 1908." Brown's Directory comes out in the fore half of each year, and is understood generally be engineers to contain the records of operation to the extent that it goes for the preceeding year; that
1351 is Brown's Directory dated in 1908 would contain some figures, from the operation of gas companies for 1907 and that is the directory from which the information in exhibit "362," with one exception, is obtained.

Exhibit "362" gives a list drawn from Brown's Directory of cities where gas plants are located and of the thousands of feet of gas sold according to Brown's in each place in the year 1907; of the highest net rate charged for said gas per thousand feet; according to the same authority, of the miles of mains reported in Brown's Directory as in use by the plant in the specified location; and in the last column is a set of figures that I have obtained simply by dividing the thousand of feet of gas sold by the miles of mains to give the thousands of feet sold per mile of mains. All of the companies exhibited in the table had a net rate of as low as one dollar in the year 1907. Emporia, Illinois and Cedar Rapids, Iowa, the net rate was 90 cents. In the case of Colorado Springs and Pueblo the rate of one dollar applied to gas that was used for fuel purposes by the purchaser and there was a net rate of $1.50 which was applied to gas in case the

consumer was so unfortunate as to use it for lighting. Unfortunate because he had to pay the extra 50 cents if the gas company caught him doing it but I suppose they had two meters for each consumer. In the Cedar Rapids, Iowa company the records which I have shown here, a sale of 91,330 thousand feet of gas at 90 cents is not taken from Brown's Directory but is taken from the printed records before the United States Supreme Court in the case of the Cedar Rapids Gas Light Company vs. Cedar Rapids, a case as I understand it the validity of the 90 cent rate which had been fixed by the municipality was sustained; in the record of the sale of gas in that year it is given as 91,330 thousand feet for the year 1907, just as all these figures are, and the rate required by that ordinance being con-
1352 sidered in that case was 90 cents,—I know that personally because I was employed in that case by the City of Cedar Rapids and it is shown in the record. There should be a reference mark which the stenographer has omitted from the Cedar Rapids to the words "per record United States Supreme Court."

Referring to the sales per mile of mains for the companies shown in exhibit "362," it appears that the Lincoln company sold 2,798 thousand feet per mile of mains, which is a medium figure compared with the sales of the other companies, neither the highest or the lowest but are up towards the highest figures. These companies shown in exhibit "362" are companies in this section of the United States; the exhibit was compiled with that in view to get the companies in this central part of the United States that were selling at this rate, at the range of rates shown.

Exhibit "363" is entitled, "Some gas plants where the highest net rate per thousand feet for any purpose are not over one dollar in 1907, per Brown's Directory of 1908"; this being the same copy of Brown's Directory referred to in exhibit "362."

Exhibit "363" is compiled on the basis indicated in the heading, namely, that the rate charged by the company was not more than one dollar per thousand feet highest net rate, and the table is unlimited as to location as far as the United States is concerned. That is, it picks out companies all over the United States whose output runs all the way from 11 millions at Canton, Ohio to 50 millions at Erie, Pa., 75 millions at La Crosse, Wis., up to 9,500,000 thousand feet of gas sold in Brooklyn, New York. Many of the rates in the table are below one dollar; that at Cleveland was 75 cents,—that is a much larger plant than the Lincoln plant, the output is much larger; on the other hand the City of Wheeling, West Virginia had a rate of 75 cents, I think that was from a municipal plant. Cedar Rapids, Iowa has a rate of 90 cents on an output of 81,330,000 feet, and as in the former table the figures for Cedar Rapids
1353 are taken from the records of the United States Supreme Court. As I make it by a quick count here there are about 18 plants shown in this table that were selling not more than the Lincoln plant in 1907 and that sold for not more than one dollar, two of them selling below one dollar. At Cedar Rapids the rate fixed by the company was $1.00, but this 90 cent rate had been fixed by the city authorities and was in litigation, and as I understand, the

decision of the court was subsequently held to be valid, so that it would apply there in 1907 although the company was insisting on its right at that time in the courts to charge a rate of $1.00.

Exhibits 339, 340, 341, 342, 343, 344, 345, 346, 347, 348, 349, 350, 351, 352, 353, 354, 356, 357, 358, 359, 360, 361, 362, and 363 offered and received in evidence.

I have made a study of Massachusetts plants for the purpose of a comparison with the Lincoln plant. I have taken a number of Massachusetts plants that sell gas at $1.00 per thousand feet and compared them as to rates, capitalization, book assets, and extending of plant equipment with the Lincoln plant; these in the main included the same companies as in my former testimony but the list is here extended for the purpose of the present comparison. I prepared exhibit "367" which is entitled "Massachusetts plant with rates of $1.00 or less for gas and the Lincoln plant in 1912."

This exhibit "367" is a summary of exhibits which follow it and which is intended to represent in a concise way the final figures of the other exhibits. Exhibit "367" involves a comparison in the first place between 18 Massachusetts plants and the Lincoln plant; and a further comparison in the second instance of 11 of the previous 18 Massachusetts gas plants with the Lincoln plant.

Taking first the comparison between the 18 Massachusetts plants and the Lincoln plant in the matter of rates; the highest net rate per
M feet charged by each of the Massachusetts plants which
1354 ranges from 75 cents in some of the plants up to $1.00 in
others. While some of the plants don't charge an entirely uniform rate, some of them do. I have paid no attention to that variation one way or the other but have tabulated the plants as to the highest net rate which each one charges for gas per M feet and if in any of the plants they charge a less rate than the maximum net rate for some purposes, for consumption, etc., I have paid no attention to that factor.

The net rate in Lincoln is $1.20 and so stated in exhibit "367." Now the million feet of gas sold by each company during the year in Massachusetts ranges from 57 million in the smallest plant to 783 million in the largest plant, whereas the sale in Lincoln was 234 million.

A word of explanation is needed there about those figures in this respect; the Massachusetts figures are for the year ending June 30, 1912. The Lincoln figures are for the calendar year of 1912; each set of figures, therefore, represent a 12 months' operation. They don't exactly represent the same 12 months, one ending in the middle and the other at the end of the calendar year.

From memory I make an explanation as to the plant that sold only 57 million feet and yet charged $1.00, that is the Attleboro, Massachusetts Gas Plant, and the rate there last year, 1913 was $1.00 per M feet net; I find that rate of $1.00 was not in force during the fiscal year ending June 30, 1912 but has since been put into affect,—I had forgotten that at the time I made this compilation,—during the fiscal year ending June 30, 1912 it was not but one dollar is the rate there now.

For the 18 plants in Massachusetts the sale of gas during the year was 7,488,972 thousand feet as against 234,386 thousand feet in the Lincoln plant. The combined holder capacity of the 18 Massachusetts plants was 36,329 thousand feet, in Lincoln it was 850
1355 thousand feet. Now dividing the thousand feet sold into the holder capacity gives for the Massachusetts plants a holder capacity of 4.85 feet per M feet of gas sold during the year; and for the Lincoln plant 3.62 feet per M feet of gas sold by it during the year.

Taking again for comparison the feet of mains of greater dimension than 2 inches it appears that the 18 Massachusetts plants had 10,523,556 feet of such mains while the Lincoln plant had 141,285 feet of such mains. Reducing these feet respectively to feet per thousand feet of gas annually sold we obtain for the Massachusetts plants 1.4 feet of mains of greater diameter than 2 inches per thousand feet of gas sold; and for the Lincoln plant .6 of one foot. These figures as to holder and mains indicate to my mind distinctly a smaller and less costly equipped plant as to those features of the Lincoln plant than in the corresponding figures in the Massachusetts plants here considered.

The total feet of mains in the 18 Massachusetts plants is 11,414,-602; according to the testimony of the company as I understand it, in the Lincoln gas plant there are 459,251; that gives for a total feet of mains per M feet of gas sold 1.52 for the Massachusetts plants and 1.95 for the Lincoln plant, showing there are a somewhat greater length of mains when you take into account the large amount of mains of 2 inch diameter here in Lincoln whereas if you leave the 2 inch mains out the length of mains per thousand feet sold is less than one half in Lincoln than in the Massachusetts plants.

Comparing the mains in the matter of percent it appears that in the Massachusetts plants the length of mains greater than 2 inches is 92.1% of the total length; in Lincoln it is 30.7% of the total length, showing again the relatively small amount of large pipe in the Lincoln system.

The 18 plants in Massachusetts just considered are in part operated by companies that also operate electric plants so that the
1356 capital stock in its relation to dividends and dividends in their relation to the gas out-put, can not be accurately and conveniently compared because the companies that operate both derive their dividends from combined sources of gas and electric service and their capital stocks and bonds are devoted in part to each class of service; so that of the 18 Massachusetts plants already mentioned and the names of details of which appear in later exhibits, 7 are dropped out for the purpose of the next comparison. They are not the 7 that have combined service, not all of them, one, Haverhill is in litigation with the Commonwealth of Massachusetts and had paid no dividends during the year, for that reason in considering the matter of dividends that plant is excluded; I don't remember for the moment that there was any other exclusion except on the basis of gas and electric service and the peculiar situation

of the Haverhill plant, which is engaged in litigation as to rates and paid no dividends.

Passing to the lower half of exhibit "367" the number of plants concerned with the Lincoln plant is 11: the 11 plants sold 5,108,479 M feet of gas as against 234,386 M feet of gas sold by the Lincoln plant.

Taking the average dividend for the 11 plants in Massachusetts now under consideration, it was 10.05% of the stock. That average was obtained by taking the entire dividend paid in dollars and dividing it be the entire capital stock of those companies,—for I should mention here that these companies have no bonds outstanding,—so that apart from any interest that have been paid, and as will appear was paid on notes, the dividends represent the entire returns of the stockholders and consequently the investors got out of it; that is subject to qualifications about notes which will be gone into more in detail.

As to capital stocks and bonds of these 11 plants in Massachusetts which do only a gas business they had outstanding at the
1357 close of the year $8,964,100 par value of capital stock, there were probably additions to that stock during the year. I haven't brought that out in this exhibit and haven't the figures to show what additions if any there were, but these large gas companies are frequently increasing their stock and I have no doubt there is stock outstanding against the property during the year as a whole were somewhat less than the figures at the end of the year; any addition would tend to increase the total stock.

For the Lincoln Company I understand the stock and bonds to be $2,250,000.00 outstanding. I took that from the Supreme Court printed record in the former hearing of this case; if something has been added since I didn't take account of it here, I don't know that anything has been actually issued since. While my notation reads capital stocks and bonds the word "bonds" was put in to cover the entry as to the Lincoln plant; there are no bonds outstanding of the 11 Massachusetts plants; it is all capital stock, as gas plants in Massachusetts usually prefer to issue stock instead of bonds. The next entry shows the plant's assets per company's books. Those statements of assets are purely the statements of the company concerned, made to the Gas & Electric Light Commission of Massachusetts, they are statements of opinion, as all statements of the value of assets as apart from the cost must be; I suppose the Commissioners exercise,—as far as I am able to see how and have studied the matter for a series of years as to the bookkeeping of these Massachusetts companies and their returns,—exercise no supervision or any authority, they are the amount of assets reported by the companies. In other words the companies report their assets respectively at what the companies' officers think they are worth, or what they choose to report them and that amount is unchanged and not supervised by the commissioners in any way to determine whether it is correct or not. In a rate investigation the Commission isn't bound at all by the statement of
1358 the company's assets, in fact in a number of those rate investigations I have been in I was not able myself to find any such

value of assets as was reported by the companies. At any rate it is a fact to be considered in all the rate investigations in Massachusetts along with any other relavent fact, but it is not controlling on anybody unless it would be the company and I never knew it to control them very much. These plant assets for the 11 Massachusetts plants are reported for the year 1912 at $13,818,834.00 while for the Lincoln plant the book assets given in this case are $785,081.00.

As to the items I have included here under the term plant assets, I would say that all of the items are corresponding to the returns of the Massachusetts companies, real estate,—that is land and buildings,—all machinery and holder equipment, and main service, and meters, in other words it is the complete manufacturing and distributing plant of the company; but it does not include outside investments like the stock and bonds the companies may hold or cash they have in the bank; it is the physical plant of the company, that they use presumably in the gas business. Although that is subject to slight variations in this respect that our companies in Massachusetts even hold some real estate that is not used or useful in the gas business, either by way of vacant land or property that they rent; I didn't investigate that statement as to this group of companies merely mention it as an incidental line of assets. It would take an exhaustive investigation to find which particular real estate wasn't used in the gas business. I haven't gone into that I have simply taken the total.

The next figure to my mind is an extremely important one it is the cents dividend per M feet of gas sold as compared to the per cent dividend to the stocks and bonds.

1359 The per cent of dividends to the stocks of this group of companies was 10.05 and the cents per M feet of gas sold actually paid in dividends was 17.64: meaning thereby that if you take the entire dividends paid by those companies and divide by the entire number of thousand gas feet sold you get 17.64 cents per thousand feet. This amount of 17.64 cents per M feet enabled those companies to pay a dividend of 10% on their capital stock,—for each thousand feet of gas they put out on the average they paid a dividend of 17.64 cents,—and that amounted to 10% on their stock.

Lacking figures as to dividends for the Lincoln company I have dealt with the net income of the Lincoln company as I have computed it but not as shown on the face of the books of the Lincoln company. That net income of the Lincoln company in the year 1912 computed on the sale of gas at $1.20 per M feet I make to be 58.46 cents per M feet sold.

The next item in exhibit "367" is per cent dividend to plant assets, which is 6.52 cents,—which by mistake is placed in the wrong column being placed in the column for the Lincoln company and should be in the column for the Massachusetts plants as I have not been advised as to what dividend, if any, the Lincoln company made, and made no entry of that kind for the Lincoln company,—the 6.52 cents means that taking the statement of the plant assets of the Massachusetts companies as they give it the dividends they pay amount to 10.05 on their stock represented by 6.52% on their plant

assets as shown by their books and a greater bulk of that gas was sold at voluntary rates to make these dividends and earnings; that is, the rates which the companies themselves fixed and I think that this figure of 6.52% for dividend payment to plant assets throws some light on the probability that it is an accurate statement of assets.

1360 The next line, per cent net income to plant assets, which is properly entered in the Lincoln column, the amount in per cent is 17.45; that is the net income as figured by me for the Lincoln company in 1912 amounted to 17.45% of the company's claimed plant assets as shown by their books.

The next entry is per cent plant assets to stocks and bonds. For the Massachusetts plants this per cent 154.15; obtained by taking the stock of the Massachusetts plants and dividing it into the book assets or plant you find that the ratio is 1.54 per cent of books assets to capital stock.

In the same way for the Lincoln plant the percentage of capital stock and also of bonds in this case,—because the Lincoln plant has out some bonds,—is 34.89%. To put it shortly, in Massachusetts the plant assets as stated exceed by more than one half the capital stock with no bonds outstanding; and in Lincoln the book assets as stated by the company, are a little more than ⅓ of the outstanding stocks and bonds.

The difference between the 11 Massachusetts plants and the Lincoln plant in this respect is further brought out by the next entry which is stocks and bonds per M feet sold. In Massachusetts the stocks only,—there being no bonds,—for these 11 plants was $1.75 per M feet gas sold. It means th-t they had outstanding in the way of stocks $1.75 par value for every thousand feet of gas they have sold during 1912.

If I had correctly copied the stocks and bonds of the Lincoln company their figure amounts to $9.60 per M feet gas sold during the year as compared with $1.75 in Massachusetts.

The next line in exhibit "367" are compared the plant assets per M feet gas sold as stated by the books,—that being all I am dealing with here book assets,—the plant assets per M feet for each group of plants. For the Massachusetts group the combined assets of

1361 plant per the books per M feet sold it $2.70, and for the Lincoln plant the books show $3.34 per M feet sold. That is all of exhibit "367" which is merely a summary.

In considering these figures it should be mentioned that the Lincoln company operates both gas and electric plants. A very large figure here for stocks and bonds per M feet gas sold, being $9.60, as compared with $1.75 in Massachusetts. It must be born- in mind that the Lincoln company carries on an electrical business as well as the gas business and the plant for that electrical business is represented in part by the stocks and bonds outstanding against it; I can't make any precise division of course, as we are dealing with the Lincoln plant I had to take it as it is and put down there what they had I haven't included any electrical plant assets, all the Lincoln plant assets are of gas.

Exhibit "368" consists of figures and writing including "All expenses except materials and labor making gas, repairs, renewals and taxes." Both in dollars total and in cents per thousand feet of gas sold. The first set being dollars total and the next in cents per thousand feet sold.

This is an exhibit similar to that already presented to a number of other Massachusetts plants. It shows the total expenses of the Worcester gas plant, with the exceptions noted as to expense for each year beginning with 1895 and ending with 1913. The items of expense considered are divided into two main groups, the division is not particular important or very precise but is as near as can conveniently by made. The important thing about showing the expense is the total of those expenses which for the Worcester plant in 1895 amounted to $25,760.00 and in 1913 to $70,994.00; in 1895 the Worcester company sold 158,541 thousand feet, or less than the
1362 Lincoln company sold in the year 1907, and the total expenses here considered at that time amounted to 16.24 cents per M feet of gas sold. In the next year it was 13.58 cents and as in the following years by dropping gradually reaching 8.24 cents in the year 1913,—in fact in the year 1911 it was less than in 1910 being 7.62 cents.

The meaning of tabulations like this one as to the Worcester Gas Light Company was gone into perhaps sufficiently in my former testimony, I will say again it includes all of the reported expenses of those companies, except those specifically excluded in the heading of the exhibit, namely: materials and labor making gas, repairs, renewals, and taxes. Exhibit 369 was prepared by myself with the help of my assistants and shows the gas sold; the maximum net rates charged therefore; and the dividends paid in 18 Massachusetts gas plants during the fiscal year ending June 30, 1912 as to Attleboro I wish to repeat the correction already made. At Attleboro it was $1.10 and was reduced after the close of the fiscal year June 30, 1912 to $1.00 so that the $1.00 stated here is incorrect as applying to that year, although it was reduced the next year to $1.00 in other words this experience wouldn't apply to the dollar rate it was $1.10.

In this exhibit "369" there is set out the name of each plant, being indicated by the name of the city where located, in the left hand column and is treated entirely by itself, no combined computations are based on the figures as to dividends and price of gas, so that the misstatement of 10 cents in the Attleboro rate does not viciate any computation that has been made as far as this table is concerned. The range of sale in these plants was from 57,326 M feet in Attleboro to 783,734 M feet in Worcester.

These 18 plants here are not intended to include all the plants that sold gas at $1.00 or less in Massachusetts in the year 1912,
1363 except the Boston Consolidated Gas Company, which is so large I thought it inadvisable to include it in the tabulation. The sale in Boston is very great as compared to that in Lincoln, the price in Boston was under $1.00 and which would have to go in had it not been for its large size.

Two plants, Lynn and Worcester, sold gas at 75 cents per M feet

in the year under consideration as the maximum net price; several other- sold at 85 cents; and other- 90 cents and on up to $1.00. These plant- paid dividends which range as high as 16% on the capital stock at Lynn and as low as 7% at Malden.

The Haverhill plant paid no dividend whatever, because that is engaged in litigation as to its gas rate, in former years the dividend- of the Haverhill plant have been substantially as large or larger than any of those here. The litigation was not to secure a lower rate, but arose in this way: The Gas & Electric Light Commissioners of Massachusetts fixed a rate of 80 cents per M feet for gas in the City of Haverhill, the company was then and is now selling at the 85 cent- per M feet, and to prevent the lowering of the rate from 85 cents to 80 the company is litigating in the United State*d* Court the constitutional validity of the rate fixed by the Gas & Electric Light Commissioners of Massachusetts, and that litigation is -till going on.

It will be noticed in exhibit "369" that several of the entries as to cents in dividends per M feet sold are marked estimated. The reason and meaning for such marking is this: The company so marked operates both gas and electric plants and the amount they paid out in dividends can't be precisely divided between the gas and electric business. To arrive at an approximate idea of the dividend paid by these companies as to the gas business, I took the proportion of the entire dividend payment to the net earnings of the plant, that is the excess of income over operating expenses and then took the
1364 same percent of net earnings derived from each class of business, namely, gas and electric business; that gave me the dollars of dividends that I assigned as paid out of the net earnings to each class of business and the gas business showed a net earning and the electric business shows a net earning, those combined earnings were greater than the dividend paid, I assumed that the dividends were paid pro rata out of the net earnings.

I call attention again to the amount of dividends in cents per M feet of gas sold that these percentages of dividends on stock amounted to. In other words, taking Attleboro there was a 12% dividend, and this isn't affected at all by my misstatement of the price at Attleboro; there is a 12% dividend at Attleboro amounting to 12.14 cents per M feet sold in that year.

In North Adams the figure is quite small 6.74% per M of gas sold. That is the smallest one in the list, outside of Haverhill where no dividend was paid. Looking down the right hand column of exhibit "369" with three exceptions the dividends here paid which range from 8% to 16% and amount to less than 20% per M feet of gas sold. In one case the figure was 20.2%; in another it was 20.34%; and in another it was 26.71%; with those exceptions the dividends were all less than 20% per M feet of gas sold and yet they amounted to the percentages ranging from 8% to 16% set out in the column of percent of dividend.

Exhibit "370" is entitled "Feet of mains and holder capacities Massachusetts gas plants, June 30, 1912." Exhibit "370" deals with the same 18 Massachusetts gas plants that were referred to in exhibit "369" and gives the total length in feet of mains, larger than

2 inches for each plant, the percent of mains larger than 2 inches in diameter and the total length for each plant fo- the thousands of feet of holder capacity for each plant.

1365 I will deal only with the totals which were used to arrive at the average quantities as the figures are so obvious.

Taking the total feet of mains in all of the plants which was 11,414,602 and of that total 10,523,556 feet had a diameter greater than 2 inches; the percent of those mains with a diameter greater than 2 inches was 92.1; the total feet of holder capacity was 36,329 M feet.

Exhibit "371" is entitled "Feet of mains and holder capacity per M feet — gas sold Massachusetts plants, June 30, 1912"; and reducing to figures per M feet of gas sold the length of mains and the holder capacities shows in toto in exhibit "370." Considerable variation will be noted in the total feet of mains per M feet of mains of diameter greater than 2 inches, per M feet; also in the feet of holder capacity, per M feet of gas sold; I will deal simply with the averages which are obtained in every instance by dividing the total quantity average by the total thousands of feet of gas sold. In other words dealing with the total sale by these 18 plants of 7,488,972 M feet of gas sold during the year it appears that for each M feet of gas sold as stated, there existed in these plants selling the gas 1.52 feet of mains, of all sizes, and 1.4 feet of mains having a greater diameter than 2 inches; there also existed in those plants a total holder capacity per M feet of gas sold of 4.85 cubic feet.

These are the same figures carried into exhibit "367" marked "A" in this folder. The intention of the figures is to indicate as far as they go the extent of the plant equipment under consideration.

Exhibit "372" is entitled "Capital stock and dividends of Massachusetts plants, with no bonds and rate $1.00 or less, year ending June 30, 1912."

This exhibit "372" deals with the 11 plants summarized in exhibit "367," the names of the plants are set out in exhibit
1366 "372" and their total capital stock amounted to $8,964,-100.00; the total feet of gas sold by these plants is also set out amounting to 5,108,479 M feet during the year. The percentage of dividends to capital stock of the 11 plants is also given in exhibit "372" running from 7% from Malden up to 12% for each of the several other plants — Fall River, Lowell, Springfield, and Attleboro, and the average rate is 10.05% which was shown in exhibit "367." Whether that is the average of the capital stock or the average based on the sums of the percent divided by the number of plants,—I should explain that this figure 10.05 is obtained by dividing the total dollars paid in dividends by the total capital stock on which it was paid; I should consider that only a fair average.

The final column in exhibit "372" being that of cents dividends per M feet of gas sold, obtained by dividing the total dollars paid in dividends by the plants by the M feet of gas each plant sold during the year. These dividends run up all the way from 12.14 cents per M feet of gas sold in Attleboro up to 26.71 cents in Salem. There

is only one instance where the amount of dividends per M feet of gas sold was over 20 cents that was for Lowell where it was 20.2 cents. That average in each case is a true average. To obtain the 17.64 cents of dividends per M feet of gas sold, I took the total sale of gas which is 5,108,479 M feet and divided it into the total dollars paid in dividends by these properties giving 17.64 cents per M feet sold which enabled the payment on the average, dividends of 10.05% on their stock. In my opinion the showing as to the actual cents per M feet of gas sold is a very crucial one in gas matters. That gets right to the bottom of the whole matter, that is providing you-dividends are representing the entire returns to the investors in the property.

Motion to strike out the answer as a mere argument because the exhibit shows on its face that it is 15 to 26.

1367 Overruled. Exception.

(Witness continuing:) I am simply saying that I think it is an important figure, I am not saying whether it should be more or less.

Mr. Rose: Attleboro is 12.14 and Salem is 26.71, both figures are involved in that average and there is a wide variation.

(Witness continuing:) A thousand feet of gas is a very definite and precise unit, and stocks and bonds that may be outstanding against a property is subject to very great variations, a number of conditions I ought not to discuss. It is important to determine stocks and bonds and percent of any dividends paid as to stocks, but when we get to thousand feet of gas we have a perfectly fixed and precise unit, for that reason it is a very informing factor whatever the amount of the dividend may be.

Exhibit "373" is entitled "Stocks and notes Massachusetts plants with one dollar or less rate and no bonds in 1912."

The same 11 plants considered in exhibit "372" are also shown in exhibit "373" with the sales of gas in thousands of feet.

In exhibit "373" however, the amount of notes payable outstanding by the respective plants, have been added in each instance to the capital stock of the plant. I don't mean to imply by that addition that the notes necessarily represent the plant, I think they do in some instances and do not in some others, but in order that a complete showing may be made I include them here for whatever they may be worth. The plants have no bonds; they have so much stock, shown in exhibit "372," and they have outstanding some notes which may or may not in particular instances represent the plants.

1368 The two right hand columns in exhibit "373" of first, the stocks, and second, the stocks plus notes of those plants per M feet of gas sold. The range of capital stock, at par, runs from $1.01 per M feet of gas sold up to $2.97 in the 11 plants, taking the total volumn of stocks outstanding at par against these plants and dividing by the total feet of gas they sold during the year, giving a true average of $1.75 of capital stock at par outstanding for each thousand feet of gas that the plant sold.

In the same way dealing with the final or right hand column of exhibit "373" it appears,—if you add in all the notes that the plant had outstanding, without regard to what those notes represented,—and then divide the sum total of the sum of stocks and notes by the M feet of gas sold you will obtain $2.09 per M feet of gas sold, that is, representing the amount of stocks and notes that was on June 30, 1912, outstanding against those companies. I don't think that all of those notes represent plant investment; I do think on the other hand, that some of them do.

Exhibit "374" is entitled "Capital stock and stock premiums Massachusetts gas plants June 30, 1912."

Explaining the meaning of stock premiums under the Massachusetts system, before stock can issue of a gas company that company must come in before the Gas & Electric Light Commissioners and show what the plant is to be paid for by the stock that is desired to issue; and must show the market price of the stock; must nominate a price at which stock of a given par value,—say $100.00 will be sold or taken if the issue is allowed by the Commissioners, thereupon the Commissioners either authorize or refuse the issue.

As to many gas companies in Massachusetts, and in fact that seems to be the case for very nearly all of these 11 plants here considered,—

1369 the investment represented by the stock of those companies are so attractive that the stock sells for more than par,—that is the market price of the stock for some of them is very much more than par,—$200.00 to $250.00,—something like that sometimes. So that for these prosperous companies the stock can only issue if taken at a premium therefore, for each one of the 11 plants here considered there have been paid certain amounts of stock premium when the stock was issued by the company, and these amounts of stock premium are know- and I have set them out here so as to show each and all of these 11 companies. The par value of the stock is shown in the column headed "stock" and the amount of the stock premium at which a portion of the stock has been required to issue; the premiums draw no direct dividends. The dividends are on the par value of the stock, but nevertheless the money for the premium went into the treasury of the corporation because they couldn't get the stock out without letting it go at a premium.

For the 11 companies that sold 5,108,479 M feet of gas in 1912 and had outstanding $8,964,100.00 of capital stock at par value, there had been paid into the treasuries of the corporations $3,092,433.00 of premiums. I am not dealing at all with the amounts or with the price at which the stock once out of the treasuries may sell for in the market. I have nothing to do with that. I am merely dealing with the amount the stockholders had to pay for this stock in order to get it from the treasuries of the corporations in the first instance.

Taking that stock valued at par and adding the premiums to it, it all amounts to the figures per M feet of gas sold shown in the right hand column of exhibit "374," and finding as before a considerable variation from $1.26 per M feet sold up to $3.52.

1370 My justification for adding the notes in exhibit "373" or omitting them in exhibit "374" being a little less than $2,-

000,000.00,—I have added the notes in exhibit "373" so that it might appear that I had made a full representation of the facts as they are as to the obligations or liabilities of those companies; I specifically stated that I didn't think all those notes represented plant. I have a very good reason for thinking so if that is to be gone into. I think to add the stock premium and notes both to the stock would rather tend to an unfair than a fair impression. If anybody thinks they should be added, I have given them there and it is but a mere matter of arithmetic to do it.

Exhibit "375" is entitled "Assets and dividends of Massachusetts gas plants ending June 30, 1912."

The assets here dealt with are the plant assets as reported by the companies in their books and previously mentioned. The gas dividends are the dividends actually paid in dollars, with which a previous exhibit have dealt. The assets for the group of 11 plants, for the 11 plants already considered, was $13,818,834, and the plants reporting those assets paid as dividends $901,204. The thousands of feet of gas sold for those 11 plants has already been stated. The book assets for the plants as shown in exhibit "375" amounts to $2.70 per M feet of gas sold.

The percentage of dividends to assets will be seen in the last column and varies from 4.53% in Attleboro up to, I think, 8.5% on Newton.

Taking the entire amount of $901,204.00 and dividing by $13,818,834.00 of assets gives an average payment of dividends to assets of 6.52% by these companies.

Exhibit "376" deals again with the same 11 Massachusetts plants having no bonds out and with a dollar gas rate, with the exception that while Attleboro now has a dollar rate in 1912 the rate was $1.10 that fact, however, does not viciate any of the computations in exhibit "376."

1371

Exhibit "376" shows the total gas sold in each plant and for the group; the total dividends paid again; also the total interest paid; the total dividends paid amounted to $901,204.00 as mentioned. The total interest paid by these plants, which would include interest on all outstanding notes, and also some small amounts of interest on consumers' deposits, rather trifling but which amount to something; all of that interest amounted to $92,387.00.

Now if that amount of dividends $901,204.00 and the $92,387.00 interest paid are added together and divided by the thousand feet of gas sold it gives a total of .194 cents per M feet of gas sold, which represents it seems to me more than what the owners of those properties got for the use of their property per M feet of gas sold; I say more, because I know all of that interest don't represent interest on the cost of the plant, but all of it together with this dividend amounted to .194 cents per M feet of gas sold. The dividends alone were .1764 cents per M feet of gas sold as shown in another exhibit.

Exhibit "377" is entitled "Sales of gas at $1.00 and less per M feet by Massachusetts plants, year ending June 30, 1912."

That exhibit covers three sheets in this exhibit "377" the gas plants of Taunton, Haverhill, Lynn, Lawrence and New Bedford are consid-

ered. These plants are taken because at the time their gas rates were reduced to one dollar the out-put in each instance was some less I believe, than the out-put in Lincoln in 1907; and exhibit "377" is intended to illustrate the sales of gas that arose from reductions of the rate to $1.00 in the first instance and subsequently to less rates than $1.00 through the series of years represented for each plant,—as the plants reduced their rates to one dollar and less in these
1372 years,—of course the statement for the respective plants covered this series of years but in each series I have given for each plant the series of years beginning one year before the rate was reduced to one dollar and coming down to 1912.

For each plant there is given the year; the dollars gas rate per M feet, meaning the maximum net rate, and the thousands of feet of gas sold during the year; also the percentage of increase over the first year,—by the first year I mean the year next before that in which the dollar rate appears. The first plant in exhibit "377" is Taunton and a dollar rate per M feet in Taunton was first applied sometime during the year 1910; the sales of gas in the year 1910 amounted to 107,365 M feet. I haven't the particular month of the year when the change of rate first went into effect and take the percentage of increase in the second year that the dollar rate appears when you have had it in force for something over a year, while in the first year it might have been in force for only a month and in getting that percentage of increase in sales of gas in the next year preceeding the dollar rate as compared with the sale during the second year that the dollar rate was in force. Now on that basis in Taunton the sale of gas in 1909 at the rate higher than $1.00 was 91,753 thousand feet; in 1910 some time during the year the dollar rate went into effect, and in 1911 the sale of gas was 119,920 thousand feet showing an increase of 30.6% over the sales of two years previous in 1909. I have also figured the percentage of increase in 1912 as compared with the sales in the earlier year given for each company. For Taunton, that being a recent reduction the increase in 1912 was only 37.8% over the year 1909 when the higher rate was in force.

The Haverhill gas plant is next shown in exhibit "377" which put the dollar gas rate in force in 1900 and its sales in that year were 115,022 M feet; during the year previous when the
1373 high rate was in force the sale was 91,737 M feet and during the year 1901 under the dollar rate the sale was 115,457 M feet an increase of 25.8% over the sales in the earliest year. For 1912 the increase at Haverhill had amounted to 156.3% over the sales in 1899. The next plant in exhibit "377" is Lynn whose various figures are shown. They put the dollar gas rate into effect in 1898 and in that year the plant sold 144,444 M feet of gas, and during 1897 at the higher rate the sale of gas had been in Lynn 130,376 M feet; and during 1899 the second year thereafter the sale in Lynn at the dollar rate was 159,002 M feet showing an increase of 21.9%; in 1912 when the gas rate had dropped to 75 cents the sales of 743,042 M feet represent an increase over the year 1897 of 469.9%.

Referring again to the Haverhill plant I want to have mentioned in connection with the increase of 156.3% in 1912 that the gas rate

in 1912 was down to 85 cents per M feet. That is the increase over the out-put of the earliest year in every instance, and the increases are figured on the out-put of the year before the rate was reduced to one dollar taking it from that time, which in that case the year was 1899 and two subsequent decreases in rate there given down to 85 cents, and it shows the sale and rate for gas in each year, the whole record is set out there. These percentages might be figured for various years to show what the sales climbed up to but I haven't figured them out here.

The next company is Lawrence, the rate for gas at Lawrence was reduced to one dollar in 1901; in that year there was sold 146,549 M feet of gas by that plant; in the previous year at a higher rate the sale had been 138,314 M feet; in 1902 at the dollar rate the sale was 184,256 M feet of gas an increase over the sale of 1900
1374 of 33.2%; in the year 1912 in which year the gas rate was 90 cents and the sale was 441,324 M feet amounting to an increase over 1900 of 219.07%.

New Bedford is the next plant considered and in that plant the dollar rate was reached in the year 1906 when the plant was selling 195,149 M feet; that is the only one of these instances I think where the sale of the gas in the year when it dropped to one dollar was higher than in the Lincoln plant in 1907, and for New Bedford in 1906 when the rate first went to $1.00 it sold 195,149 M feet during the previous year, that is, 1905, the sales in New Bedford at the higher rate had been 165,077 M feet, and during 1907 when there was a further reduction to 90 cents per M feet the sale was 229,652 M feet representing an increase of 39.1% over the second year previous. In 1912 when the price of gas in New Bedford was 80 cents,—I don't know in what month,—the sale of gas in New Bedford was 472,545 M feet representing an increase of 186.3%.

Asked for an interpretation of my exhibit "377" beginning with the comparison of the years 1909 and 1910 when there was no change in the rate for gas, and whether I argue that because the rate of increase in 1910 over 1909 were larger in my tabulation than was the increase in 1911 over 1910 when there was a reduction of 10% in the rate, whether that proves that the tendency of the reduction of 10% there was to arrest the normal increase or not,—I would say the tendency of a reduction in price the quality and other factors remaining the same, is invariably to increase the out-put. Asked on that theory how I account for the figures given for 1909, 1910 and 1911 show the greater rate of increase was in the year in which there was no reduction calling attention specifically to 1910,—I would explain the situation in this way,—in the first place we don't know at what time in a particular year these rates of $1.00 and 90 cents went into effect; I don't know, and I assume counsel don't
1375 know if the 90 cent rate went into effect the very last of the year against which it is set opposite it would have very little affect on the out-put; it would take a very careful study of the situation as between any two years to give the entire full season for just what happened. Let me add this fact which happened within my own knowledge as to Haverhill in 1911: At that time there was

hearings going on during the entire year of 1911,—a series of hearings amounting to 20 or 30 before the Gas Commissioners held in the City Hall in Haverhill looking to a reduction in the price of gas; there was a great agitation about the gas business in the newspapers and on the streets concerning those hearings and arguments and evidence before the Commissioners and it would be no wonder to my mind if in that situation a given reduction in the gas reate didn't produce its normal affect. That is all I know about that just now.

Whether exhibit "377" for Haverhill shows that this 156.3% increase for the period of 12 years was the normal increase due to the increase in population, improvements in appliances, and new demands of the publis, the rate from 1900 to 1910 inclusive having been the same level rate of $1.00,—I don't think it does quite. I think a large part of the increase at Haverhill shown in exhibit "377" is one due to the increasing knowledge and appreciation by the public of the use and value of gas, which is undoubtedly a factor in the use of gas everywhere, but I don't think that is all of it. To answer the question precisely we would have to have the population of Haverhill in 1900 and 1910 and see what the sale per capita was in order to get at an accurate answer to the question. It will be noticed however, the increase in sales in Haverhill -as been simply compared with some of these other companies, I think a part of that increase
1376 was fairly due to those reductions in price that occurred in 1900 and again in 1911 and in 1912, and I think as counsel suggests, a considerable part of that increase was due to the increase in population and the appreciation of the advantages of gas.

Whether, taking Lynn representing the increase of 1903 over 1902 both years having the same rate of $1.00, the increase appearing to be 58,064 M feet or 26% pluss, and the next following year a recuction of 10 cents per thousand in rate when the increase in sales appears to be only 38,064 M feet or a- increase of 13% plus; whether there is any significance in the fact that the rate of increase in the first year's reduction was only half of the rate in per cent of the previous year,—I would say each fact has its significance, and undoubtedly the fact that counsel calls attention to does mean something, just what it means or what caused it I wouldn't be able to say without studying the Lynn situation. At that time they may have extended their territory to Sargus that year. I think however, on the showing of the Lynn out-put along with those prices that the price has had a very substantial influence in boosting its sales. It is true if you are going to pick out some particular years just two years say, and figure how you are going to explain that you will have to study the local business very minutely to explain it, but you take a series of years you can see those local factors are minimized in effect.

If you look at a particular year you must in the first place know in what month your reduced rate went into effect and then study all the local circumstances. I may state as to that Lynn rate, according to my recollection that for all of it they voluntarily reduced the rate and I suppose it is a fair assumption that the company making that reduction to 75 cents for gas thought it had a bearing on that very

large increase of out-put they have had there. Asked whether
1377 it might not necessarily reflect in the net revenues the increase in any one year because it might have been due to the extraordinary exertions to promote the sale,—I didn't say anything about that.

Exhibit "378" is entitled "Feet length of mains added by certain gas plants in various years, per reports in Massachusetts". Meaning the reports to the Gas & Electric Light Commissioners. The exhibit shows the length of mains that have been laid by the various plants mentioned in exhibit "378" in various years and has had a bearing on my judgment in fixing on the 7% which I did fix on to be added for engineering, interest, etc. which I added to the other structural costs of the Lincoln gas plant. The matter of interest for the loss of that time during which a given length of mains can be reasonably laid are, of course determined to some extent, the interest that must be lost on that construction whil- in the process of construction and before it is ready to use.

As I understand the testimony of the company it had on January 1, 1913, 459,251 feet of mains, and I should expect those mains during the course of one season not any less than one year or season of one year for laying mains in the event of the construction of a plant like the plant in the City of Lincoln; I notice in the instance of the Brookline Company in the instance of 1894 they laid 565,002 feet of mains in a single year; that laying occurred under a pretty difficult situation to lay mains, namely, in the City of Boston which like other large city is greatly interlaced with pipe and other structure below the street surface. (Interrupted.) Asked whether those were mains actually constructed or acquired from other companies,—I would say those mains were actually laid, that is a celebrated instance where they were laid for competitive purposes, back in 1894.

The next instance is that of Brockton in 1912, they jump all around in the matter of years,—I *amy* say that under the form of the Massachusetts returns each gas company must in each
1378 year in its sworn return to the Commissioners state the length of mains which it has laid during the year, of each size and the total length.

Taking Brockton in 1912 they laid 227,687 feet of mains, in addition to a large lot of mains that they then had in that year,—that was simply the yearly addition, they made a large extension that year.

At Brookline again in 1895 after the large laying of mains in 1894 in the next year laid 221,965 additional feet.

And so running on down the list the number of instances of laying more than 100,000 feet of mains in a year are shown. I think they show to an interesting extent what can readily be done in the laying of mains. I have taken these increases of mains for different plants for the reasons that it very seldom happens nowadays that a gas plant is constructed De Novo in a large city, the gas business is fairly old and particularly in larger cities, it is very hard to find a large city without a gas plant. A large city in which a new plant extending all over the city has not been built in any recent years,

and those mains I mentioned here are not the total, but simply additions to the existing plants laid in that year.

In the Brookline case, that company in 1894 had relatively a small amount of mains in the City of Brookline and had laid 565,002 additional feet in that year.

Exhibit "379" is entitled "Time provided in contracts for the construction of gas plants." The exhibit gives the dates on which certain contracts for plants as stated were made; and the dates per the same contracts when the construction was to be completed. This exhibit "379" like the previous one has a bearing on my judgment in the matter of the necessary time to construct a gas plant, and the necessary interest charges to be included in the construction cost.

1379 I give here the records I have from a number of contracts for gas equipment. Here is a one million foot gas holder in Springfield, Illinois and the date on the contract was November 6, 1912 and the date of the completion was July 1, 1913. A one million foot gas holder is double the capacity of any gas holder in this plant, considerably larger in size, and a large holder like that is about the biggest single piece of equipment that a gas plant of any such as Lincoln would be apt to have and would require fully as much time for construction of any piece of gas plant would expeect ordinarily to have.

A little further down in exhibit "379" is a one million foot holder in Haverhill, Massachusetts the contract was dated September 30, 1910 and the date set for its completion was March 1, 1911. And then they had the disadvantage of working largely in the winter months. It will be noticed that those dates show the time periods of construction materially less than a year in every instance.

Here is a million foot water gas set in Springfield, Ill. the date of the contract was April 19, 1905 and the time specified for its completion was 90 days from the date of the contract. As to whether I would call that the usual and reasonable period to figure on,—I would say it does not strike me as particularly unreasonable. I think we would be able to construct water gas sets in that way.

I have here a million foot water gas set No. 4½-B in Haverhill, Massachusetts, the contract was dated September 10, 1910, and the date of the completion was December 15, 1910; that is three months and 5 days, I think that is rather a reasonable period.

Here is a little purifier contract at Springfield, Illinois,—one of these outdoor purifying boxes 25 feet in diameter and 10 feet deep,—

1380 the contract was dated June 24th 1912 and the date for completion was not until September 29, 1912. I should think that if anything, was a little unreasonable in the matter of length of time because that purifying box is a comparatively small structure.

Here are four purifiers, outdoor boxes, Holyoke, Mass., 17½ feet in diameter,—I haven't the length and depth of those boxes here, they are good big boxes something like 10 feet deep,—the four are erected on the steel structure out doors. The contract was dated

May 19, 1909 and four months was set for that construction, which I think was very ample.

Here is a 7′ 6″ water gas set, one of the larger sets here in Lincoln, the contract for that set was dated May 24, 1912 and the date for its completion was August 1, 1912.

Here is a 200,000 gallon oil storage tank at Haverhill, Massachusetts, the date of the contract was December 23, 1910 and the date for its completion was January 22, 1911.

Here is a 10 foot station meter at Haverhill, which was contracted for September 15, 1910 to be completed January 1, 1911.

Without taking all the items I will mention the large purifier at the Haverhill plant; these boxes were 20 by 15 by 7½ feet, four of them, the contract was dated September 15, 1910, to be completed November 24, 1910.

Those contracts illustrate what I am very sure that the fact that periods very much less than one year are sufficient for the erection of such pieces of equipment as exist in the Lincoln gas plant.

Exhibits 367, 368, 369, 370, 371, 372, 373, 374, 375, 376, 377, 378, 379 offered in evidence by the defendant and received in evidence over the objection of the plaintiff to which the plaintiff duly accepted.

(Witness continuing:) I have at least one of the Springfield contracts here.

Exhibit "380" is entitled "Lincoln Gas & Electric Light
1381 Company cost of mains laid in 1903 to 1912 per work orders."

The exhibit sets out a compilation of cost of mains laid from 1903 to 1912 as per work orders, and contains the cost of mains laid within the years mentioned as shown by the so called work orders,—one of the forms of record on file in the office of the company,—the size of mains found to have been laid per work order records are 2, 4, and 6 inch, and their cost has been footed up under the divisions "cost of materials; cost of labor"; and also the total feet of each size has been footed up.

The total feet of mains laid in the 2 inch size as found from these work orders,—by this I mean to say that we have found work orders which show on their face the laying of 184,263 feet of 2 inch mains, and we have found work orders for the laying of 27,453 feet of 4 inch mains; and 2,556 feet of 6 inch mains,—the cost of materials of all sorts shown on the work orders for 2 inch mains is $19,167.47; the cost of labor on those mains is $18,551.05; making the total cost for the 2 inch mains laid of $37,718.52; reduced to the cost per foot for the 2 inch size the figure for the cost of material per foot for that quantity of pipe and all other material which is 10.40 cents; the cost of labor per foot is 10.06 cents; the total cost per foot per these work orders for the 184,263 feet of pipe is 20.46 cents. That figure as compared with what I allowed in my report for the same size I think is a trifle greater, it seems to me my figure is about 18 cents for the wholesale construction of a plant the size of this one,—this if for piece meal construction stretching it over the years,—I should not expect it to be quite as low as the cost of the size of one job.

For the 4 inch mains as found on the work orders the total length was 27,453 feet laid at a cost for pipe and all other materials
1382 of $8,108.81; the cost of the labor was $4,429.59; and the total cost $12,538.40. Reducing the 4 inch cost to cost per foot the figure for materials is 29.53 cents; the cost of labor per foot is 16.13 cents; and the total cost per foot is 45.66 cents.

I am bearing in mind in connection with these work order costs that they involve the cost of laying mains under tracks and so called electric crossings and that sort of thing, as well as laying under other conditions encountered here in Lincoln. My figures for labor, for instance per foot of mains laid, includes all those extra costs, except the paving which is estimated separately; I understand these work order figures do the same thing, that is, they show the costs actually encountered, if they had to go under tracks that made the work outside of tracks a little more expensive.

Of the 6 inch size we found 2,552 feet of mains laid at a cost as stated for materials of $1,167.00; cost for labor $495.26; making total cost of $1,662.26.

Reduced to cents per foot the materials for the 6 inch size amount to 45.73 cents; labor 19.39 cents; and the total material and labor 65.12 cents per these work orders.

Explaining these work orders, they are sheets on which the foreman apparently reports the labor cost and a list of the items that go into the main laying job, the pipe and other materials used and the list of the labor on that job. They are usually signed by the foreman or by his initials as I remember. These mains costs have already been dealt with by me in an analysis of the costs in the so called annual gas reports of the company, which is another form of record found in the office of the company. I am not able to say, without setting up a comparitive table, just how near these costs shown on the work orders are to costs shown as per the gas reports, but the work orders would appear to be even a more primary
1383 source of information than the gas reports, although I am not questioning the accuracy of the sources of information.

Exhibit "381" is entitled "Lincoln Gas & Electirc Light Company, cost service pipes per cards,—A to R".

The Lincoln Gas Company has in its office a series of cards which I have called service cards, I think they are commonly known here by that name. The cards are filed as I remember according to the names of the streets where the services lie alphabetically; so that it is not possible to get chronological annalysis of record of the service laying without a great deal of labor, and we didn't attempt it, and didn't go through all of the service cards either, we did take the cards just as filed from the letter A to a part of "R". I think we didn't finish the cards under letter R, the cards under letter A would represent the services laid in or under streets whose names began with "A" and so on down through, that is the way we took these service cards and that method of selection was purely a blind method, there was no object behind it any more than to get the record of as many cards as possible,—we got the record of 1639. Those services included 103,394 feet of pipe; the cost of that pipe

was given at $6,446.02; and the cost of other materials at $1,423.50; and the cost of labor of those services was given at $9,816.57; making a total cost for the services as shown on the cards of $17,686.09.

I have reduced some of these costs to cost per service, and cost per foot of pipe laid; the cost of pipe per service of the pipe of 1639 service- I make $3.93; the cost of other materials per service is 86 cents and the cost of labor per service is $5.98; making a total cost per service of $10.79.

This includes the complete length of service pipe as laid clear in to the meter, $10.79 is what the record shows, if it is wrong I will have to correct it at another time.

1384 Taking the cost per foot the cost given for pipe amounts to 6 cents per foot; the cost for materials 7 cents per foot; and for labor 9 cents per foot and the total costs per foot is 17 cents.

Attention being called that the total cost per foot is not right as 6 cents, 7 cents and 9 cents make 18 cents instead of 17 cents,—I would say through some error those costs have not been carried out to the 1/100 cent as is my custom. I am testifying that these figures are correct to the best of my belief, as far as having it in the fraction of the cents the decimal has been omitted, these figures being obtained by division and not by addition, and if you leave off all of your tenths and hundredths of a cent you wouldn't get at this figure as suggested.

Exhibits 380 and 381 offered in evidence by the defendant and receive- in evidence over the objection of the plaintiff to which the plaintiff *accepted*.

1385 Mr. ALTON D. ADAMS, a witness for the defendant, previously sworn herein, was recalled for further examination in chief:

Examination in chief by Mr. Foster:

Exhibit "391" is entitled gas sales and rates per reports of the Massachusetts Commissioners. Exhibit "391" was made by myself, and my assistants under my direction. Its source is the printed reports of the Massachusetts Gas & Electric Light Commissioners, which refer back again to the original sworn returns of the companies, of which the printed reports are a compilation.

In several instances, for the population I have gone to the United States Census Reports. I think all this information is contained in the printed reports, but the same information is in the original returns; this is merely compiled from the printed reports. Exhibit "391" is to show a number of the larger gas companies, mainly those, perhaps entirely those, for which the price and other data have been previously given,—the price and volume of sales in 1900, a United States Census year, also the price and volume of sales in 1910, a United States Census year,—as a result of that the feet of gas sold per inhabitant of the several districts served of the population on the basis of the United States Census,—there is no effort to determine just how much of the population may be reached by the company's

mains,—we have simply taken the acknowledged population as reflected by the United States Census in each case for the place served. That isn't the amount consumed per consumer. It is the amount per inhabitant in that municipality, or municipalities as the case may be,—many and perhaps all of the companies mentioned render service in some out-lying municipalities,—and in taking the pop-
1386 ulation the intention is to take the census population of all the municipalities in which the company renders service,—for lack of space the names of all suburban places is not written in, but that is revealed in the printed report of the Massachusetts Commission. All the figures here are from the sources already indicated, except the feet sold per inhabitant, which is a mathematical deduction,—obtained by dividing the total population into the total gas sold there in the respective years,—so we get the sale of gas per inhabitant by that simple division in each case.

Attention is called in the exhibit to the highest net prices at which the gas was sold in the municipalities as existed in 1900, and for the price of gas in the year 1910, and in connection with those two prices attention is called also to the thousand feet of gas sold in these respective municipalities in 1900 and 1910; and finally to the sales in feet of gas per inhabitant, which is shown in the right hand column, and shows to my mind, the marked increase in the sale of gas per inhabitant that has occurred all along with and at the same time as has this reduction in price of it.

The North Adams figures for 1900 rate are not given because I didn't have with me the record that gives that, but the sales of gas in 1910 show a large and substantial increase. I haven't carried out in the column of feet sold per inhabitant any figures for 1910 as to North Adams. The reason being that North Adams sells some gas to several other companies and I didn't have with me the record of those sales for 1910, I left it as it appears.

The same is true for East Boston where with a price of gas of $1.40 in 1900 and 90 cents in 1910 there was a rise in sales from 50,000,000 in 1900, to 241,000,000 in 1910, some of that, to my best recollection, for the sale of gas to other companies in 1910, not being
1387 able to segregate that I have been obliged to omit the figures per foot sold to inhabitants as to East Boston. Those are the main instances where that difficulty has been met.

Coming to Taunton, in 1900 the price of gas was $1.20, in 1910 it was $1; its sale of gas in 1900 was 53,000,000 feet; in 1910 it was 107,000,000 feet, showing an increase over 1900 when the sales per inhabitant was 1718 feet and 1910 it was 2863 feet. It will hardly — necessary to go through all the figures that way, but I should like to show one or two for illustration. All the figures are worked out in exactly the same way.

Exhibit "392" was compiled by myself, and under my direction, from the records of the Gas Company; as to several of the figures from Mr. Lea's valuation of the Lincoln property; and as to several of the figures from Brown's Directory. The population in 1900 and 1910 is taken from the United States Census; and the feet of gas sold per inhabitant is derived by the division of the feet of gas sold in Lincoln

by the population. Exhibit "392" shows a fall in Lincoln in the price of gas from $1.73 per thousand feet, as given in Brown's Directory in 1898, to $1.20 per thousand feet in 1904, at which figure it has since remained.

The sale of gas in Lincoln in 1898 was 40,738 thousand feet, and in 1912 it was 227,297 thousand feet. Coming to the Census years, according to Brown's Directory in 1900, it had a sale of 60,000,000 feet, which on the then population of Lincoln gives a sale per inhabitant of 1493 feet; at that time gas was apparently sold in Lincoln at $1.50,—I say apparently, because Browns' Directory doesn't give the price for that year, but I do find that Brown's Directory gives the price of $1.50 for 1899, and $1.50 for 1902, and probably was $1.50 in 1900, although no computation is based on that probability.

In 1910, when the price had fallen to $1.20, and the sales had risen to 208,024 thousand feet in Lincoln, with an increase of 43,973 in population, the sales per inhabitant amounted to 4730 feet, or more than three times that at the $1.50 rate in 1900. Showing to
1388 my mind that the gas consuming public in Lincoln have responded nobly to the reduction in price that has taken place, and I should expect that from the situation in Lincoln as to fuel. Domestic fuel in Lincoln, as compared to Massachusetts, for instance, is substantially 50% more per ton. Comparing the sales per inhabitant,—and the increase in sales occurring in Lincoln, with the reduction to $1.20,—with the increase that has occurred in Massachusetts,—with a much greater reduction, down below a $1.,—I think it is a pertinent fact to bear in mind that the gas consuming public in Lincoln will absorb more gas than the gas consuming public in Massachusetts; the prices the Lincoln public must pay are more expensive than the Massachusetts public can secure. Not speaking of the price of coal in carload lots, but such as the common consumer must pay per ton the way it is ordinarily sold. In other words, from exhibit "392" while in 1910 the consumption in Lincoln is pretty high as compared with the Massachusetts cities mentioned,—I should expect a still further large consumption in Lincoln, largely because the price of other fuels with which gas competes, approximately, to the ordinary user, is 50% higher in Lincoln than in Massachusetts. That is not also true of coal gas. The next exhibit will show the comparative cost of coal gas and coal and coke for generating fuel for making water gas. Then explaining that gas coal is the name applied to the stock of coal we put into the gas benches to make what is known technically as coal gas, as distinguished from water gas. The coal we put into the water gas generator we don't call gas coal, and isn't that kind of coal known to the trade as gas coal. On the other hand if we use it in a water gas generator it is hard coal; we often do use in lieu of that, coke, but never use a gas coal in the water gas generator.

Exhibit "393" was prepared by myself and my assistants under my direction, it is entitled: "Gas rates, price of coal per ton; and gas made in Lincoln, as per returns from Massachusetts Com-
1389 missioners 1912," and also in a number of Massachusetts cities, and price of gas coal,—I never use the term technically,

—but coal suitable for use in making coal gas for gas-ification in retorts. In that column of gas coal there will be noticed reference marks to two entries: Haverhill and Fall River. And below with reference marks attached the statement: "W. G. generator fuel", meaning water gas generator fuel. The entries of prices corresponding to Haverhill and Fall River are the prices paid for the fuel used in the water gas generators,—those two plants have no coal gas equipment,—except that Fall River now has under construction an extensive coal gas equipment. Haverhill has none. The other plants here listed all have coal gas equipment; and two of them, as will appear in a moment, made no water gas whatever. Lincoln made only water gas, but it has a coal gas equipment, and might make coal gas.

As to the sources of this exhibit "393", it runs back to both the printed reports of the Massachusetts Commissioners, and to the sworn returns of the individual companies to those Commissioners. The price for coal, for instance, is not given in the printed reports of the Massachusetts Commissioners and was taken as here copied from the original returns of the companies to that Commission. The towns are New Bedford, Fall River, Lowell, Springfield, Worcester, ——— (interrupted.)

Mr. Strode: The point we make, we have investigated those original returns and if you are going to switch to other towns, it would not be fair to us, we would have to go back again. Fall River isn't in the other report.

(Witness continuing:) We are using the same towns I have used before.

Mr. Strode: Objects to the use of exhibit "393" including the price of gas coal because it is based, according to the statement of the witness, upon the original reports on file with the Commissioners in Massachusetts, and is not available to counsel for the company, particularly objecting to the towns of New Bedford, Fall River, Lowell, Springfield, and Worcester.

1390 Referee: Sustained, to permit that to go in now would be followed by an application for further time to investigate it, and that time I don't think ought to be given; I don't believe the matter is of sufficient importance to justify it. The exhibit will go into the record for the benefit of the court, notwithstanding the ruling. The objection is sustained—exception.

Mr. Strode: That is limited to the one exhibit or item that we have no way of verifying?

Referee: Yes sir.

Mr. Strode: As to the other items found in the printed record showing the population we have no objection to.

(Witness continuing:) The item of the price of gas coal has been taken from the original records. It is not in the published report.

The percent of the cost of coal obtained from the sale of residuals is exhibited as to a number of plants in exhibit "393" in one column, these figures are worked out by the Commissioners and printed in their report, and are taken from that source. This showing is to the extent to which the cost of coal is, or may be, recovered from

residuals tends to reduce any differences existing between different places in the cost of coal.

The feet of gas made, as distinguished from the feet sold, is shown for each of these plants, except Lincoln, it might have been put in for Lincoln, I haven't got it I see, however, Lincoln only made water gas so the percentage shown in the right hand column of water gas made would be for Lincoln 100 as it was for Haverhill and Fall River. All the other places made coal gas to a greater or less extent. Two places, Taunton and Charlestown making only coal gas,—except those mentioned, all the others making a substantial percentage of coal gas during 1912.

Since on the stand before I have made corrections as to exhibit "381". Exhibit "381" gives the cost of service pipes from the cards of the Lincoln Gas & Electric Light Company's service cards "A" to "R" and I have figured in exhibit "381" that the cost of
1391 the pipe the labor and materials add to so many cents per foot, the tabulation was completed in my absence and brought to me while I was testifying and I found that the figures had not been carried out to the hundredths of a cent, as they should be per foot of each element of cost of the service pipes; furthermore the feet of pipe per service, on the average, was not stated in exhibit "381" as it should have been, and I have made the suggested additions to exhibit "381" on another sheet so that the cents per foot are carried out to the hundredths of a cent for the pipe and other materials, showed in connection with the service and the labor and these all total the cost of the service per foot. (Corrected sheet identified as defenda-s-s exhibit "381-*a*", and offered and received in evidence as a substitute for exhibit "381".

Exhibits "391", "392" and "393" (Except the portion of "393" previously excluded by the Referee) offered and received in evidence.

Exhibit "394" is entitled "Lincoln Gas & Electric Light Company, operating expenses and income of years 1907 and 1912." Setting out the expense and income of the gas department month by month, for 1907 and 1912 respectively. They are copied from the records of the company, known as gas reports on file in the office of the company, being the records of their gas business. The intention being to show the reported expense of the company in each month of the respective years of 1907 and 1912, and also its reported income.

In mentioning these expenses of the company for each month of the years 1907 and 1912 respectively, I think a portion of these reported expenses are unnecessary and need not be incurred reasonably in carrying on a gas business. I have in other portions of my testimony indicated what these items are and my reason for thinking they are not necessary. In exhibit "394" I simply give
the total expense as reported by the company without making
1392 any deductions therefrom.

Exhibit "394" is given for the purpose of information and as a basis for information as to the proper and reasonable amount of working capital to be allowed the company for its gas business. By working capital I mean capital to work with. In other words the money or money's worth that the company must reasonably

have to put into the business, or kept ready to put into the business, as distinguished apart from any monthly receipts from month to month from the business itself, which is merely the overturn of the working capital, and not to be confused with the working capital at all, which the company and its promoters must put into the business to make possibly the buying of things and working them up into gas and getting the money and keeping that process going. The income exceeds the expenses of the company every month by a substantial amount, which is what we expect, knowing that the gas and sometimes residuals sold one month in a great part are paid for during the following month.

These reported expenses do not necessarily represent money actually paid out during the month. I have no doubt but their business is carried on in the usual way by getting the usual credits in connection with buying such materials,—wages of course, are paid weekly, monthly or some intervening period.

It being true that general credits are obtained for the purchase of materials, and the income follows pretty closely every month after the expense as a return for the expense of the preceding month, greatly reduces the amount of necessary working capital if the returns,—meaning payments for gas principally,—was on some longer basis.

Having invested $100, in materials for making gas, worked that up into gas and sold it at $200, it would be highly improper to consider your $200, as a part of your working capital,—that is simply a part of your overturn of your working capital,—which if you have good luck during the year, you will finally pay out
1393 in dividends at the end of the year. You don't expect to pay dividends daily or monthly.

The cash in the bank for the payment of interest on bonded debt, surplus or some other case, has nothing whatever to do with working capital. Working capital is the money we must have to carry on the business with, aided by reasonable times of credit, moneys that come in month by month with the overturn. It must be put in in addition to your fixed assets to reasonably and economically carry on the business. It is not the money you get out of the business to pay dividends with at all.

Exhibit "395" is entitled "Lincoln Gas & Electric Light Company operating expenses in each month, and coke, coal and oil on hand at close of month, per gas reports of 1912."

This exhibit taken from the gas reports of the company and shows the total expenses as reported by the company for each of the months of 1912, also the coke, coal and oil on hand at the close of the month. In the final or right hand column is the statement "Dollars working capital equals expense of one month plus coke, coal and oil on hand end of month." That statement is not intended as a hard and fast rule, but merely an indication of the opinion of the witness, that the amount arrived at in this way, in this way, represents an ample working capital.

It is necessary to carry some supplies in the gas business on hand all the time, and these supplies on hand run from $2935.25 in April

1912, to $5265.54 in July, 1912. It is not necessary to pay spot cash for all of those supplies, and is not the common or convenient conduct of the business to do so; sometimes a special discount is obtained for spot cash; the more ordinary time of payment is allowed and taken. That applies to supplies on hand as well as supplies used through the month to make up the total month's expenses.

1393½ Taking all these factors into consideration the statement to the effect that the working capital, in this instance, may be taken as equal to the expense of one month as reported, plus coke, coal and oil on hand, which appears to me to be a fair allowance for the working capital of the Lincoln Company in its gas business. That is, take the month of January the company will provide substantially $20,000. to carry on its business of purchasing supplies and paying labor in the usual way, I think that $20,000. will be ample to meet every expense it is called upon to meet, taken in connection with the money it will obtain for its gas beginning in the early part of February, and so I have fixed on $20,000. as an ample working capital to be allowed this company in its gas business. These figures are taken from 1912. I should allow the same amount of working capital for 1907, although the business was substantially smaller in 1907, the company was then making a substantial amount of coal gas, and if it took very short credits on its coal,—30 days for instance,—it would require more working capital when making coal gas than when making water gas. I find that the company appeared to be carrying more supplies in 1907, in the way of coal, than they did in 1912, so I should think the allowance of $20,000. for working capital for 1912 and for 1907 was very ample.

Exhibit "396" is,—in what I have just stated I had forgotten what appears in exhibit "396"; I have here the coal on hand at the end of each month in 1907 as well as 1912, also the oil for 1912, and the sum of the coal and oil in 1912. This sum of coal and oil in exhibit "396" was used in exhibit "395". Exhibit "396" was compiled from the records of the company, the gas reports, and sets out month by month for 1907 and for 1912 the dollars of reported cost for the coal on hand, the oil on hand in 1912, and then the sum of the coal and oil on hand for 1912. I didn't put in the oil on hand for 1907, either because I overlooked it, or because it is not stated in the gas reports, otherwise I should have put it in.

1394 Oil is used mainly in the manufacture of water gas, almost entirely in the manufacture of water gas in a combined water and coal gas plant where any enrichment is obtained, in enriching with coal gas so you enrich the combined product to the required point. In 1907 they were making coal gas and didn't need as large an amount for sales in 1907 as they did in 1912. In fact you can make good coal gas without any enrichment whatever.

Exhibits "397"-"398"-"399"-"400" and "401" offered and received in evidence.

Mr. ALTON D. ADAMS, was recalled in chief and testified as follows:

Examination in chief by Mr. Morning:

Asked to give my definition of "going value", and so much of my theory regarding it, and such observations as I care to make in regard to it and its place in a rate hearing,—Would say, "Going value," to my mind, is the value of a business. We hear the term now-a-days constantly as to the business of public service agencies, and in dealing with it I have public service agencies more particularly in mind, but I don't think that going value is by any means confined to public service agencies, or that a business which does not happen to be done with the use of the public streets necessarily lacks the element of "going value" at all.

"Going value," as I say, is a value of a business; in other words, no business, no value. Looking at it from the other end, the greater the business, all other things being equal, the greater the "going value." A business means income, necessarily involves income. So that the idea of income, although not to the full extent, the amount of income is involved in "going value" and in computations to determine the amount of "going value."

I have in mind the expression of Mr. Justice Brewer in the
1395 original "going value" case,—the Kansas City Water case,—
where he refers to the reasons for the rule, in discussing it, he uses the expression: "And earning the money that it does earn."

So that my best consideration of the subject "going value" is an intangible value that does not inhere in any plant or any business to the physical property,—although possessed commonly by the owners of a specific physical property,—is a value that depends, to some extent, on earnings, and it is to be arrived at, in my opinion, by a computation showing what it would cost to acquire the business under consideration. What it would cost to acquire it, not the present discounted values of estimated future incomes of such a business would be. I disagree entirely with any such method of computing going value as that. For one reason, that it includes all franchise values, as for instance, taking a method of computing "going value" which involves a discount to bring to their present worth all sums which it was supposed would be received; or all the profits which would be received through the business for a term of future years, I should not consider that a proper or correct way to compute "going value" at all. Because you are computing the value of something else besides the business, you are computing the value of the franchise to do the business.

My best study of the subject of "going value", which is an undoubted element of value,—and element that really exists,—is that that element of value is not, and cannot, in the nature of things, be reasonably a part of the basis considered in fixing rates.

To make it a part of the basis in fixing rates appears to me to be reading into a public grant something, that is in the first place entirely lacking on the face of it; and something not necessarily implied by anything on the face of a public franchise grant, and

worse than that, to my mind, reading into a public grant, a grant of a public franchise, a provision which would necessarily defeat, to a large extent, if not entirely, the police power to regulate
1396 rates, because the greater the business and the greater the income of the business the greater, to a certain extent, the "going value", and, the greater the "going value" the greater the rates that must be allowed to allow a fair return on the "going value", so we have that reasoning in a circle in that way just as we used to have with the franchise proposition.

Then too, a further reason of mine for thinking that conclusion is absolutely correct and that "going value" is an element of value,—while a theory only,—is not one that can form the basis of rate making, where the rates are subject to regulation,—if found in a study of the pleadings and facts in the Consolidated Gas Case decided by the Supreme Court. In that case,—as I understand it,—the company in its bill of complaint, and through the mouths of its leading expert witnesses, defined a thing which is called "good will", and included all the elements that must necessarily go into a "going value" determination.

They included the business, the organization of the business, the extent of the business, the nature, the name and the good will in their bill of complaint and through the mouths of their witnesses; and their witnesses valued that, as I remember it, at a good many millions of dollars and it seems to me,—I am just stating this as a reason for my opinion,—that when the court excluded, as it did, specifically "good will" as an element for rates that it wasn't dealing merely with empty words, but dealing with the things that the company described and called "good will."

So, I think in the Consolidated Gas Case, taking the record of that case, the court fairly excluded as elements to be considered in a rate case, the very elements that must be considered in making any computation as to the amount of "going value".

I have the Master's report here in town and shall be glad to introduce in the morning from it those extracts from the plaintiff's
1397 bill and the testimony of its witnesses on which it relied to establish this thing which it called "good will", but which by description and enumeration included elements that must necessarily go to make up "going value".

What I have said implies, I think necessarily, that "going value" is distinctly an intangible thing of the business,—not of the plant; the plant may exist without the business, and the business may exist without the plant,—.

You ask how can that be? I am supposing a temporary destruction of the plant. Take a factory, suppose we blow it up over night,—here is an automobile business with a factory,—the supply is gone, because the business will undoubtedly wither away, if you don't make a provision to take care of it, because the particular physical thing easily suppose an illustrated case where the things have disappeared That is my idea, while some particular group of physical things, of course, is always found where there is a going business value as an aid for carrying on the business that that value represents, I don't

think the value is in the things at all, it is in the business. You can easily suppose an illustrated case where the things have diseappeared and the business replaced by others, and the business wouldn't be affected at all, or if at all, only a little.

I see the book containing the Master's report has arrived, and it might be well to read into the record some of the extracts I had reference to, or I can pass that and put them in as written exhibits in the morning.

Well, part of the matter to which I referred in the record of the Consolidated Gas Case, as disclosed in the Master's Report, is found at page 82 and page 83. It is there stated in an extract from the bill of the Consolidated Gas Company, as follows:

"In addition to its said franchise rights, your orator is possessed of a large amount of intangible property, which constitutes an integral and important part of said business. Such property
1398 consists of the value of the connections between the pipes and mains, of your orator and the various buildings throughout the city of New York, the value of various contracts owned by your orator in connection with its business, the value of the organization of your orators business and good will, and various other elements of value which have been created and developed by your orator and its predecessors through intelligent and efficient business management during the past three-quarters of a century and fidelity to their engagements, all of which possess the full attributes of property and materially add to the gross earnings of your orator, upon which it pays an annual tax of one per cent. to the state of New York. By reason of such good will it would be difficult, if not impossible, for any company in the city of New York, even if vested with similar franchises to those possessed by your orator, to compete in selling gas to consumers in the said city; and if your orator elected to sell its tangible property and franchises, it could, apart from these, obtain a large sum for the said good will, and your orator avers that upon this good will, as an element of substantial value, it is entitled to a reasonable return, and that, in fixing the price, at which your orator should sell its gas, as hereinbefore stated, the said Commission of Gas & Electricity allowed no return whatever upon the value of the said good will but wholly eliminated it as an item of substantial value."

There are described in that extract from the bill, to my mind, elements absolutely essential in a computation and in the existence of "going value"; in fact, the elements of so-called "going value". But, as I have said, it does not matter at all, to my mind, that the company chose to designate that group of elements, and that group of valuable things by the term of "good-will".

1399 Referring here to the expression: "Such property consists of the value of the connections between the pipes and mains, of your orator and the various buildings throughout the city of New York."

I don't understand the bill to speak of the physical value of the service pipes that run into the buildings, that is to be taken care of in the schedule of the physical property of the Consolidated Gas Com-

pany, but I do understand the phrase of the bill to refer to the fact that that Consolidated Gas system had an established business, as represented by those physical connections with a great many thousands of gas takers in New York; in other words: they had a gas business worked up, and was carrying on a gas business and supplying gas to a great many gas patrons.

In this connection I think it is perhaps proper for me to say that another reason for my conclusion that "going value" is not an element of value to be considered at all in a rate case, is due to the fact that as I understand the cases, and have studied them, I don't recall one where "going value" has been included as an element of property, except in cases where it was a case of property in transfer; of course, the Kansas City case was a case of that kind. It was a taking over of the water works by the City. And the recent Omaha case, which went through the Supreme Court, was another case of the same kind. And then too, I remember the Justice in the Knoxville case specifically points out that he is not passing on the admissibility of the " going value" in a rate case. I don't know of any case in the Supreme Court of the United States, and I haven't any idea there is any such case where "going value" has been included in a rate case; I don't know of any case in any court of last resort where it has been included of the many, and there are quite a number which I have read, showing the "going value" included and the amount allowed therefor—I am not testifying, of
1400 course, that there isn't such a case—I am saying that I have examined quite a number of cases where it has been included, but in every case they have turned out to be cases of buying and selling the property,—— Condemnation cases, exactly, or cases of that nature, perhaps it isn't taken exactly under Eminent Domain, but the property was to be taken and transferred as a whole. Possibly they did allow it in the Oklahoma Telephone Case, I didn't read that case; I have heard it mentioned, but I am not trying to testify what the law is, but stating the impression I got from reading a number of cases where "going value" has been allowed, and in every such case that I have read of it in a court of last resort, it was the case of the taking or transferring of the title of the property.

I notice it also quoted here by Mr. Justice Brewer in the Kansas City Water Case, where he lays stress on the same matter of having connections between the water plant, in that case, and the houses and buildings of the water consumers, just as the Gas Company did in the New York Consolidated Gas Case, of having connections between their gas system and the various takers of gas.

But certainly I should be at a loss to estimate the "going value" of an alleged gas business that had no gas connections and no means of conveying or getting its gas to the various takers—of course, I could conceive with our modern developement of liquified gas, of a business which was carried on by carrying packages of liquified gas around in carts and in that way I think such a business would have a "going value", and there you wouldn't have to have the gas connections. Or water connections similar to the gas con-

nections such as Justice Brewer talked about. The- wouldn't have to have actual gas connections and that was dealt with and excluded in the Consolidated Gas Case, you would have a series of
1401 carts or what not, but you would have a gas business. But as it is in Lincoln with the gas running through pipes here the connection of the pipes with the property of the gas takers is an essential element; if you find the connections you know they have got the business. No connections, no business. That is all it amounts to.

There is another extract from this Master's Report that I would like to have copied out and present in the morning.

Now the computation as to the amount of "going value" attaching to any business, to my mind, shapes itself up in about this way: Take it here in Lincoln, the gas business, we find there is a certain amount of it. A certain amount of money or income is being derived from that business.

Now I think that roughly, the steps to be followed run along the line of finding out by the best estimates and computations we can make, based on experience here or elsewhere, the cost of creating for a new property that has no business or no connections with a new property that has no business, a business equal to that existing here. That doesn't necessarily mean an income equal to that which is being obtained here, and it doesn't imply at all the charging of the same rates that are charged here, which might have a great deal to do, one way or the other, with the rapidity with which the business could be acquired; I take it the rates on which any such computation is reasonably based must be in themselves reasonable rates; and reasonable without regard to the amount of the "going value".

As I say, the moment we admit the "going value" as an element on which to base rates, knowing it depends in part on income, at that moment we have begun to reason in a circle—a bigger income, a bigger "going value". A bigger "going value", a bigger income; a bigger property on which the income must make a fair return, I see no escape from that.

So, I think the rates to start any computation must be
1402 fair as to the other values on which those rates are based by having a fair return. And, having found out what the fair rates are and applying them and making an estimate as to the cost of carrying on or building up a business at those fair rates until you get a business of the present dimensions, will give, to my mind, a sum fairly representing "going value".

That is, representing a sum that a man who wanted to do that business, and who was in a position to do the business, and who had a right to do the business, that computation would give for that business that has been created at somebody else's expense, rather than to go and create a like amount of business at his own costs and expense.

Referee: That excludes "going value" as a basis for reasonable rates?

(Witness:) Absolutely. I tried to make it clear, that is my

opinion. I can't see any place for "going value" as a basis for rate cases. My position is it has a "going value" but not to be taken in a computation for reasonable rates, exactly. There is no doubt but a man would give something more for a plant here,—suppose he bought this or built another and we bring him to the time when he is ready to supply 10,000 gas takers, there is no doubt but he would give something to have these gas takers already at his door and ready to receive that gas and have that business all worked up. I didn't say that this theory excludes the estimates or the opinions altogether of "going value". I didn't say that we have any "going value" on anything that I have said, we simply have got ready to go ahead and estimate.

Whether we are not going to take an estimate,—that comes of reasoning in the line suggested, we are going to take into account the kind of value we hear so much about in connection with local matters, namely, the value to the fellow who wants the thing and is in a position to use it or get it in some other way if he
1403 doesn't buy, or will give for the thing that is in existence.

Here is a man that has a plant, and has an exclusive right to do business in this city, but he hasn't got any business, by going to work and running his plant and hiring a manager and hiring all the help necessary to get ready to supply gas and supplies it he can gradually build up a gas business equal to that in Lincoln, but that man realizing in doing that his income will fall short of his expenses, taking into account his fixed charges for a period of time he can't earn his outgoing expenses. If a new plant starts today here in Lincoln the income during the first month of operation will be less than the expenses, that is, the net income, taking the cost of materials for making gas, managing the business and the fixed charges on the property necessary to do the business, they will far over-top the business in the first month's income he will get.

I apprehend there is no use at all in ascertaining "going value" any more than there would be in ascertaining the franchise value or "good-will" value if nothing in them may be taken into account in ascertaining a reasonable rate, but I supposed the attorneys for the City wanted some figures for "going value" in here, I might be mistaken as to the propriety in excluding it as a basis for fixing rates. I suppose it is to be in there for contingent use. Mr. Foster can tell you why he wanted it in. I don't think it has any place in any corner of the estimate itself, but I do think it has a value, just as I think the franchise value has a value, and maybe a large one; it has a value because men will give something for it, that are in a position to use it; that is my idea of value, it comes back to what a man who wants it and is in a position to use it, will give for it.

And right there on that point I want to say that is a large part of the reason why I think "going value" is limited in the way it is, namely, to the amount it would cost to acquire it; simply
1404 because I don't think a willing and well informed purchaser who had put up to him the option of purchasing a business or of working up a business would give substantially more for the existing business he might purchase than he thought it would cost

him to acquire an equal business. I think that is just as true in the gas world as in the factory world. I don't think that the man who wants to go into the business of selling shoes is going to give substantially more for a shoe business worked up than he thinks would cost him to work up one. I don't think a man who prepares to build a gas plant will give any more for a worked up business than he thinks he could acquire that amount of business for.

So, to come back as to the basis for the computation as to "going value" or cost of getting it by a man who goes about it in a reasonable way, and under modern conditions as they exist today, because we are talking of this property under present conditions, we are not going back to what it cost to do things 25 years ago, except to throw some light on present costs.

I think in assuming the amount it will cost to build up a business, a gas business in Lincoln, equal to that of the Lincoln Gas Company, without of course, the competition of anybody, has got to be based on the present knowledge of the community as to advantages of gas, and the present pre-disposition of the community to use gas if it can get it. These are the facts that lie in the minds of men. Why not expect to get a knowledge of the advantage and disposition to pay a fair price to get it and have the benefit of it? Those are the facts with which the practical, hard-headed man would deal if he was estimating the amount it would cost him to build up a business in trying to decide whether he would buy the business of someone else, or build it at an expenditure of time and money—whether he would incur the expenditure himself.

1405 To get down to the details of such a computation we have got to consider the amount of plant necessary to do the business; the fixed charges on that plant in the way of interest and depreciation; the ordinary running expenses, in the way of wages and salaries; cost of the materials to manufacture the product, and then consider the very important element of time, estimating as best we may, and basing that estimate properly, and necessarily I think, on the best experience from what has happened elsewhere, as to the time in which a given amount of business may be built up. If we have a lot of charges running against us here, particularly interest and depreciation, which amount to so many thousand dollars a year,—adding them, and taking the amount of expenses incurred according to the volume of business done,—we can't tell what that will total up to unless we can make up our minds how long it is going to take at this rate to get a certain volume of business, which is the other fact, and whose value we are trying to arrive at.

I think the general formula for determining the "going value", involves a computation showing the expenses of all sorts, including an interest charge on the amount of money invested in the fixed plant that must be incurred while a given business is being acquired; crediting the transaction with such income as is derived during the period of acquiring the given amount of business.

That is in brief the way I see "going value"; a real value, real because well advised persons would give something for it to have it if they want it and were in a position to use it.

And the estimate of the amount that would be so given, by running up in dollars the annual expenses that must be incurred in the effort to get the business and the gradually increasing income that would be obtained during the period of acquisition to partially off-set the expenses.

I have outlined the theory on which I think such a computation must be made; the computation, as stated at the start, I
1406 haven't made as to the present property. If there is time before the hearing closes, and they desire it, it will be made substantially on the lines I have indicated, not because I think it has any place as a basis of rates, but because the City wants it.

Exhibit "410" is entitled "Cost of mains, Lincoln Water Works", and shows for the years 1907 to 1913 the mains laid in feet; the number of sections dug by the job by the laborers employed on the work; and the dollars paid to those laborers for digging those sections.

By a section of water pipe trench, as dealt with in exhibit "410", we mean an excavation of the earth 12½ feet long, 2 feet wide, and 5½ feet deep; that is known here in Lincoln as a standard water pipe section of trench, and for that standard section here in Lincoln I find the ordinary going price is $1. paid to the man who excavates the dirt, lifts it out of the trench and then leaves it. That is what the man does for the $1. The source of my information is derived from the records in the office of the Water Works at Lincoln; probably six months ago I obtained from the Water Works Office what purports to be a complete copy of their records of the cost of laying mains beginning with 1907 and running down through the years. I haven't the complete record for 1913, but have some work in 1913.

Answering whether this is a record of the summaries for the years, or a record of each individual job or portion of mains laid,—which was objected to as assuming; it is his deductions and compilations from the record produced here yesterday, objection overruled,—The record I got purported to be a complete copy of the record of the Water Works Department as to the cost of laying the mains, the quantity of mains laid in the years mentioned.
1407 that is a copy of the book produced here yesterday as the record of the Water Department, containing a record of the different jobs of main laying,—job by job,—giving usually the extent of the job in lengths of pipe laid, number of sections dug, and a great amount of detail as to the sections dug, specials, etc., I went through that record for the 4 and 6 inch sizes of mains and compiled,—not from any yearly summaries,—but from individual jobs of main laying,—the number of sections of trenches dug in the job basis of digging. The workman is not paid by the day or the hour but is paid for digging that kind of a hole in the ground. I compiled the jobs where the digging was done by the section. On a few jobs the cost is not given in any way. Making this compilation I got the following figures: Beginning with the year 1907 and running into, but not completing 1913, as shown in exhibit "410". The number of sections by the job at $1. each section was 1932.92 for the 4 inch pipe and for that the Water Department paid $1932.91,

that amounted in feet to 24161.5 feet of trenching, and the cents per foot which the dollar amounts to, based on the length of 12½ feet is 8 cents per lineal foor of trench dug in the earth.

This $1. applies to digging ordinarily in earth streets. I don't know what the rule would be where there was a pavement. I have not run through the figures for totals of the 4 inch mains from 1907 to 1913. Taking the 6 inch mains there was 2175.21 sections of threnches dug during this series of years and for that we have $2175.21 corresponding to the $1. per section paid the men who did that trenching work; the length of the trench amounts to 27190.12 feet, that again being at $1. per section of 12½ feet is 8 cents per foot.

Summing up the figures of 4 and 6 inch pipe in the matter of the number of sections it amounts to 4108.13 sections for which was paid $4108.12 for trenching; that amounts to 51351.62 feet of trenching, almost 10 miles dug in this way beginning with
1408 the record of 1907 for the mains of this City.

I do not remember from memory what I allowed in my valuation for digging per linear foot of trenching; it would vary with the different sizes of trenches.

Exhibit "411" contains the results of my investigation and information, in the first instance as to the standard size of a water pipe section of trenching in Lincoln and hereabouts, which I understand to be as already stated, namely, 12½ feet long, 2 feet wide and 5½ feet deep. I am advised that in digging for pipes smaller than 8 inches it is the practice of the Water Department to let off a little on the requirement that the trench shall be 2 feet wide, because a trench of that width isn't necessary for smaller piping, and in attempting to compute the cost of this trenching that is done by the section at $1. I have set out a tabulation in exhibit "411" showing the cubic feet per lineal foot of section, not only with the standard width of 2 feet, for the trenching,—which I understand is left out by you, but required where it is necessary,—but also I have made it on smaller widths of trench which might be allowed to be dug where only a 4 inch pipe was to be laid, so as to see what this $1. per section for trenching amounts to in cubic feet.

For the full width of trench of 2 feet, 5½ feet of depth, and 12½ feet in length the cubic feet are 137½ per linear foot of trench and that divided into $1. gives a cost per cubic foot of earth removed of .727 cents.

Assuming, however, the trench would be allowed to be dug in some instances as narrow as 1.6 feet, in that case the cubic feet of earth contained per linear foot of trench would be 110, and the cents cost per cubic foot of earth removed would be .90 of 1%.

Again going through a like computation assuming the ditch might be dug only 1.5 feet wide it raises the cost per cubic foot for digging that trench to .969 of a cent.

1409 Calling attention to exhibit "239" which shows that I have allowed for trenching, back filling and disposal of the material at 1½ cents per cubic foot, for all of this trenching on the Lincoln Gas mains, and these costs for the getting of the earth out

1033

of the original position and freeing the trench runs from .72 to .96 of a cent as compared with my entire cost of the job of getting the earth out and disposing of it. Digging the earth out of the trench is approximately ¾ of the whole job,—it might be as low as 2/3 in some instances. I can't give figures that would apply in every case.

I have figured out the entire labor cost in laying these mains that were laid, by digging the sections, by the job.

I have figured up the entire cost, labor cost, to the Water Department as shown in their record for laying 4 inch and 6 inch mains in the years 1909 to 1912 and for the 4 inch in 1913, where that portion of the labor of trenching was done by the section. Simply copying the entire labor costs out of the record of the Water Department. That includes the drayage and every expense set down in the record of the Water Department.

The length of this pipe stated separately for the 4 and 6 inch sizes, has been obtained simply by multiplying the number of lengths given for the respective jobs, where it was given in lengths, as it commonly is, is pipe of 12 feet; that doesn't give the total length of pipe laid in the earth for the reason that in laying that pipe system you are all the time getting in specials, which increase slightly, the total length of main system. If you never had any L's, crosses, sleeves or any other specials in your system you would get your length of pipe in the ground by multiplying the standard lengths used by 12, a water system contains more specials than even a gas system, which add to the length of the system laid in
1410 the ground. The water record does not disclose what the length is. I understood the witness for the company yesterday to t-stify that they didn't measure their pipe, that they simply took a length of 12 feet as corresponding to a section of pipe laid, not having the longer figure to go on, it would result in a slightly lower cost per foot. I have taken a figure which is slightly lower than the total length of the mains represented simply by the number of lengths of standard pipe laid and multiplied by 12.

As to the cost of laying these water mains, which is given for comparison with the cost of laying gas mains, it is only fair to call attention to these factors. In the first place the water mains are laid much deeper and the cost is substantially increased on that account. In the second place the number of specials properly so-called in a water system is enormously greater than in a gas system. The more specials, the more labor to a slight extent.

Again, in the water system we have an entirely new structure,—the hydrant,—which does not exist at all in the gas system, as to which the element of labor is very substantial in its erection. Hydrants, are not ordinarily and properly known as specials. I say that the word "Specials" does not include hydrants. The labor of setting those hydrants adds appreciably to the cost of setting a water system and that labor of hydrants is put into this figure per foot, for the cost of laying those water mains.

Another factor that adds to the cost of water mains over that of gas mains is the fact that all the joints are laid in oakum, whereas, the great portion of pipe joints in the gas system in Lincoln are

simply joints of screw pipe which are made at a very trifling cost as compared with lead and oakum joints. They are simply steel pipe screwed together. When we come to the cast iron portion of the Lincoln main system, I understand a large portion of it is made with cement joints, which again are decidedly cheaper to
1411 make than lead joints, which we have all through the water main system.

So there are a number of factors running up the cost enormously of this water system here over the cost of the gas system in the matter of the labor on the mains.

A further element of no mean importance when comparing the costs of the Lincoln Water mains as actually laid from time to time during the last 6 or 7 years, is the number of jobs,—I think the witness testified to some 26 jobs, averaging something like 1000 feet to the job,—little small jobs of but a few blocks. There is a substantial difference between laying that and re-laying as a whole, a pipe system of the extent of the Gas system,—the difference would be,—other things being equal,—the gas system per unit of length would be laid cheaper because it was laid as a unit and as a system and wasn't split up into jobs of 1000 feet of pipe each.

Taking all these factors into consideration I mention the resulting price per foot which I have derived by a simple division of the cost set down in the water works record. For the years from 1909 to 1913 the jobs of 4 inch pipe on which the entire labor cost was given as measured in feet,—multiplying the number of lengths laid by 12,—amounting to 27883 feet, or something over 5 miles during that series of years,—and that labor cost together with all the hydrants and specials that went with it, all the valves, and any paving that had to be removed in laying that pipe, if any, amounting to $6203.06 according to the Water Works records.

That amounts again to a total labor cost per foot on that pipe system, including all it does include, to 22.24 cents.

Another element of labor cost I neglected to mention before is the large number of gates or valves, you find in the water system as compared with the gas system. Those gates and valves were
1412 classed by the witness yesterday as specials,—they are not ordinarily so classed. In my opinion these valves and valve boxes add again substantially to the water works system over the gas, or a corresponding length of gas mains. The labor costs,—I am not dealing with the material costs, and for which I offer no computations,—but taking all these additional costs into consideration the figure for 4 inch pipe laid on the jobs, where sections were dug out for $1. each for the series of years, was 22.24 cents, per foot.

Taking now the 6 inch pipe laid during the years from 1909 to 1912 inclusive on jobs where the sections were dug at $1. per section, the feet of 6 inch pipe so laid is obtained by multiplying 12 into the number of lengths was 26263 feet, again just about 5 miles; and the cost for all the labor shown by the Water Works records on these 6 inch pipes during the years stated was $6157.52 amounting to 23.44 cents per foot of mains, taking the feet a little short of the

actual as before stated, as I have computed them at 12 feet per length of pipe.

Taking that labor cost of 22.24 cents for the 4 inch pipe and 23.44 cents for the 6 inch pipe, under the various conditions I have stated as affecting the relative cost of the Water Works work and the Gas Works in this City. While the figures are somewhat higher than the figures I have given for laying these gas pipes in the matter of labor,—that taking into consideration the different factors and the additional costs of the Water Works work that they, in a very substantial way support the estimates I have given on the gas system.

As to what way the depth of trenches required for water mains adds to the cost of digging the trenches as against the depth used for laying gas mains,—you have a great number of cubic feet of earth to lift out of the trench and you have a little greater lift to make. The point I am getting at is when you make a trench more shallow than 5½ feet you not only decrease the pro
1413 rata cubic feet of earth to be removed but also decrease the average labor. It isn't as much work to lift a shovel full of earth 3 feet as to lift it 5 feet.

I might call attention here to my total costs for labor on a 6 inch cast iron main as laid in the system of the gas company; that labor cost is allowed by me for the reproduction of the mains as a whole and is 14.88 cents as compared with 23.44 cents for the Water Works mains of the same size as disclosed by their record in the way I figured it up here. My allowance for the 4 inch is 11.27 cents and the Water Works record is 22.27 cents. That is the total labor cost per foot of main laid.

Whether in the water system it involves a trench substantially twice the depth,—according to the regular practice in this part of the country it involves a trench 5½ feet deep, but I have figured 3½ feet deep for the 4 inch gas main, and 3.7 feet for the 6 inch gas main, so you have substantially a couple of feet greater depth with your water mains. You also have that factor, while it is not great it should not be left out of the account with gas mains. We are dealing with the total corrected and certified length of the gas mains, whereas, with the water mains we are taking the lengths of pipe laid multiplied by 12, necessarily getting somewhat less than the total length of water mains laid in the ground.

Exhibits "410" and "411" offered and received in evidence.

Cross-examination by Mr. Strode:

Unquestionably there is such a thing as "going value". I didn't say that value should be taken into account if the company's property is to be taken as a whole under Eminent Domain,
1414 but I think the best information I can get from reading the cases when allowed, and required to be paid for, where franchises or City Ordinances, or other documents relating to the matter is broad enough to include it and require it to be paid for. We know it isn't impossible.

Not being much of a lawyer I wouldn't dare to answer the question in the affirmative as to whether I am acquainted with the question

in Massachusetts where public service property is taken under the power of Eminent Domain. I have heard of the Gloucester case, but that wasn't taken under Eminent Domain. The property was not taken, except as to the taking of the property it was under a provision of the Statute that expressly eliminated the franchise value. It was purchased at the request of the Water Company,—a voluntary proceeding on the part of the Water Company,—but no taking against the will of the Company. My recollection is the Statute eliminated the franchise value unquestionably, the property was purchased by the City and sold by the Company. To that franchise value by statute they added the value of a "going concern" value to the property. That was in the state of Massachusetts.

Whether in that instance I would say the question of going value did inhere in that property and was added to the physical portions of that property when taken over by the City in a proceeding where there was a purchase,—I deny that; I deny that it inhered in the property. It was considered a part of the property acquired, if the term property was so used. The City acquired that property from the Company under a provision of the Statute. The Statute didn't allow anything for franchises as I remember. Referring to the specific language of the statute and whether the prohibition of the statute did not provide that the City should pay a fair value

estimated without enhancement on account of its earning
1415 capacity, or future good-will, or on account of the franchise of the company,—I can't state from memory. It may be so, I don't dispute it. The court of Massachusetts in the face of that statute did sustain an award for "going value".

In the Omaha Water case in the United States Supreme Court there was added a value to the value of the physical properties designated as "going concern value" and about 10% was thus added. In round numbers a little over half a million dollars. Unless you find in the Statutes or Ordinances the requirement that the City pay for that element of value I don't recognize the element of "going value".

Whether there is anything in the Massachusetts statute authorizing specifically the giving of a value to the property on account of "going concern value",—I would be glad to read the statute, as I told you, I don't remember the statute now. I expect there was something in the statutes of Nebraska that specifically authorized the adding of a value to the property because of "going value", I know there was in the Kansas City case, where Justice Brewer wrote the opinion. It was either in the Statute, the Ordinances or the Contract, I have forgotten which. I can point it out. Judge Brewer, in his opinion uses the words: "business value", the value of a going business. I will not make an off-hand analysis, if it is wanted I will make it and bring it in. I said it was in my opinion, as far as I had seen it was only in those cases where there was an investigation there was such a decision. I do think where "going value" has been allowed that there has been a decision; I think so in the Kansas City Water Case. I can point it out later.

Whether I would think that even in cases where the property

is taken over there would have to be an express provision to authorize the payment for going value,—my mind isn't entirely made up on that. I think it is argued that the Court of Appeals of Great
1416 Britain held one way and our Courts have held the other.

I am not expressing positive information, I merely say that in any case I have studied, the underlying documents on which a transfer of the property was made, I find provisions in those documents which are broad enough to cover the element of this value in addition to the physical value. I am not saying if that provision is not there it can or cannot be supplied, although I have in mind that the court in Great Britain refused to supply it; I am stating the results of my investigation.

Whether the United States Supreme Court in the Smith-Ames case said the City could not take the franchise any more than they could take the property without paying for it,—the citation is a little vague. I should be inclined to admit that there might be such a rule of law. I think that early bridge case in New Hampshire near Brattleboro is the first case the United States Supreme Court passed on of that kind. Whether you can't take private property for public use without just compensation, will say that is, of course, a pretty general proposition of law to propound and has a great many ramifications; I think a great many times property is taken with no return for the value, in many ways under our system of laws, or any system.

Referee: Well, really that question of franchises in rate cases isn't involved.

Mr. Strode: It is involved in the way Mr. Adams presents the matter.

Referee: That is a question of law. We won't accept that and the court won't take it into consideration. I haven't been excluding anything in this case, but I think I will exclude that, you may need the time for some other purposes. Exception.

(Witness continues:) Whether "going value" inheres in the property itself,—— It does not in the physical property itself. Unquestionable the difference in cost of a meter at $7.50 in Chicago and the cost in Lincoln at $8.50, that difference inheres in the
1417 meter. It is its value that inheres in the meter, and being located in Lincoln at $8.50 and in Chicago at $7.50 put that value in it, simply that in the mind of men there is a desire to give $8. for a meter in Lincoln and $7. in Chicago. Nothing puts the "going value" in the physical property, you haven't got any "going value" in the physical property. If the difference in value between Chicago and Lincoln inheres in that meter, then the difference in value, if any, between that meter in the shop and in the consumer's house also inheres in the meter. The difference in value is represented by the additional labor on the meter in the different situations, it is wholly tangible. Whether you would value simply the meter simply in the house,—you can't value anything aprart from its location. The value of this gas plant in the Desert of Sahara isn't wourth the snap of a finger. You would value it where you found it. Its value in the house would be greater by the cost of

moving it to the house from the shop, and connecting it if it were connected. Whether if it cost so much labor to put it in the house and cost additional labor to put it in use would I add to the value of that meter the cost of putting it in use,— If by putting it in use is meant some labor performed in connecting the meter then apart from the value I might allow for the value of the physical connections themselves. I would add whatever it cost to connect that meter up so it could be used; but I wouldn't add a farthing to the meter on account of its use, but would add for getting into the situation where it could be used. Beyond that I wouldn't add a cent in getting the business, if it was necessary to do something to the meter to fix it so it could be used I would add that. I stop where the labor on the physical thing stops. A man's factor is worth what it costs to produce it without regard to what it cost to produce his business;

1418 he may blow up his factory and go on with his business and buy his goods somewhere else. The value of his business does not inhere in his factory. The value of a gas business does not inhere in its physical plant, nor in its gas mains. Whether the volume of that business determines the value of that property,—Oh no, the volume of business,—other factors about the business determine the value of the business; not the value of the physical plant at all. There are two kinds of property, tangible and intangible. The difference between this meter in Chicago and Lincoln is a tangible value. The value is what somebody will give for something. Whether for anything that goes to make that meter and put in service will increase the amount a man will give for it. I say no. By saying the value of a thing is what a man will give for it I mean, the man will give no more for the meter because the company has some business—he will give the company something for their business—but will give no more for the meter than he can produce it for and put it in that situation already for them to use. That is the value of the meter—what he can get one there in that situation for. The company has other property than its mains and meters, namely, intangible property, which goes under the general name of a business. The intangible property doesn't attach to the meter or any physical things; you can throw out all the meters you have and put in others. It is something that lies entirely above the physical property. There are two kinds of property, tangible and intangible and business value is intangible.

Referee: If there is a valuable distinction whether it is intangible or a physical thing you can go ahead.

Mr. Strode: It is the property itself, and he can't eliminate any item of that property.

Referee: I think about that, as I do the other things, it isn't — question, the facts are not in dispute and an expert can't settle it.

Exception.

1419 Assuming that meter to be purchased in Chicago and finally located in some man's house in Lincoln in service,—I wouldn't add anything whatever to the meter in any way, shape or form for "going value". It isn't the meter value. It is a going intangible business value. It doesn't inhere to the meter or attach to

it in any way; you may throw away every meter you have and have the value you have got, if you do it right. You might change every meter you have in Lincoln and put in others.

As to what process I would determine the amount of "going value" of the Company's property at this time,—I should determine the value of the going business, which constitutes a part of the intangible property of the Lincoln Company by considering the length of time it would take a person who wanted it to acquire its equivalent. I assume that the Lincoln plant or one like it, would be built here in one year without any trouble. The time it would take to acquire as much business as the Lincoln Company now has is one of the matters I haven't testified on, except to say that I haven't yet completed my computation on it.

My basis of my computation as to how long it would take to acquire the business,—would say partially by computation and partially by fact. As to the time required to acquire the business in their business to be based on such facts as you have in not only other places but in this place, in so far as the facts as to the rate at which business has been acquired in Lincoln would throw light on the question of time required of a plant starting with no business at all and get as much as you have; and so far as the Lincoln facts are pertinent I would take those into consideration; also from other places where gas plants have built up a business,—taking all the facts for what I thought they were worth, I would consider both computations and arrive at what I thought was a reasonable estimate of the time for a plant starting here without any business would be able to
1420 acquire such a business as you now have.

In making these computations and assumptions I would have the benefit of just such a situation existed as I assume; I know of places where the plant has come into existence,—it came into existence at one time here in Lincoln,—and at other places at much later dates and built up a business. Whether I would have the benefit of a city of 45,000 or 50,000 people where the plant was to be constructed and where it hadn't been served before,—I would say not in this country, so far as I know; there are some instances abroad of that sort. But there are instances of that substantially, in other lines of public service, which would give us the basis of fact to go on. I think you have a substantial amount of reliable information to go on, but I wouldn't want to put it just that way and say that you have just as much information right here at home in the development of this company as you could get anywhere else. I didn't say it was just as good as you could get anywhere else. Sure, you would have the experience of this company in building up this company; but to assume that the new company was to acquire its business as this company did, as to how long it would take and what it would cost, would be very inaccurate, because a company starting in 1913 to acquire a gas business in Lincoln, speaking generally, wouldn't be working at all under the same conditions that this company, for the last 40 years, has worked under to acquire its business; when this company began to acquire its business the knowledge of

the use of gas was very small, the price was very high. The situation has very much changed between 1875 and today.

I can't find a place where I can have the exact conditions I want to determine how long it would take,—not the exact conditions I want, but I can find lots of places where there have been large
1421 increases in the gas business in recent years that approximate more nearly to those that maintain in Lincoln now, than the whole conditions over the range of the history of the Lincoln Company, you have got a very different gas consuming public from what you had 40 years ago, I take that into account in determining how long it would take to build up the business. One of the factors is to know the community to be served and their disposition to accept the service. In giving an estimate on outside conditions you would have to know something about those conditions, and you would have to make up your mind as best you could how nearly they compared with Lincoln; they wouldn't compare absolutely on every point; you might find some so far off that they wouldn't be comparable.

I haven't completed my figures for the period of acquiring this business so am unable to assume or give now what portion of the company's business would be acquired during the first year period of construction. I have assembled a good deal of data and information upon which I could make such an estimate when I have had time to work it up; I haven't done it yet. The nature of this data is, of course, the figures for the increase in sales of your own company; the price at which that increase has been made, and the operating expenses, which I understand, you claim should be capitalized into "going value". I can't say that the growth and development of this company would be the controlling point or factor, but it would be a large factor. I have the sales for the last 20 odd years for 40 or 50 gas companies; also the sales of some water companies in very recent years that started with almost nothing that come up to their present large business—one or two—I have a large amount of that information and I think it is all to be considered. The weight to be assigned to any particular things I can't say now. I should not assume it would take a new company as long to build up its business as it has taken this company. I think it took
1422 this company about 40 years to bring its business up to the present standard. I am not so simple to answer your question in one form after I have refused to answer it in another. I told you I didn't know, and you are only wasting time by changing the form of your question, because I understand your question. As to other elements I would take into account, I would expect you to be acquiring business during this year of construction. I have no estimate and can't tell now how long that would be. I took into account the further element of the operating expenses of the company during the time it was acquiring the business. I would determine the operating expenses by looking at the experience of your company and other companies as to operating expenses, and seeing what the fair operating expenses of the company in the gas business is, and also by estimating the fixed charges in the way of interest and depreciation on your investment. In that I would be guided sub-

stantially by the experience of this company, I can't give the exact weight or extent to which it should go. I would look at it very carefully. I would take the operating expenses to find out the net results of operation during the building of that business. I should have to determine the rate for the service during that time; if I was making the estimate I couldn't make it and leave to someone else the key of the whole situation. The question of the rate would have to be considered in getting down to the net profits or losses from the operation of the business during that time, if I assumed a $2. rate I should never expect to get your business at all. I would not assume the rate the company is getting now. Whether if I were valuing the company's property I should want to change the rate before I started to value it,—would say that I am not valuing the company's physical property by this process, and I don't think the rate to be charged goes back to the value of the intangible business, I think it goes back to the physical property.

1423 In the determination of this intangible value I would want to determine it as a part of the company's property as of this time under the conditions as they exist now, but not necessarily at the rate now charged. The reason I change the rate any more than the character of the property is because I might think the character of the property was reasonable and the rate unreasonable. If I thought the rate unreasonable I would affect the going value by changing the rate most probably; there might be some compensating factors; ordinarily you would change the going value by changing the rate. If I thought the physical properties were reasonable I would take them, but it is absolutely not true that you have got to assume an unreasonable rate is charged, but I am not using the physical property in estimating the going value, except as I estimate the return and depreciation on it; I wouldn't estimate the returns. I wouldn't allow your fixed charges if you had a plant twice too big. I would take into account in valuing a property all of that property that was used and useful. In considering the question of reproducing the physical property I would consider all of the property that was used and useful when I came to value it. If I were going to estimate how long it would take to build another plant and acquire that company's business, if I thought that was reasonable for the situation, I would assume that I would build the same kind of a plant, the same equipment, and the same capacity to render the service. I wouldn't have to assume the same conditions as exist in this property, so far as the physical property is concerned, but I expect I would assume it if I thought the physical property was proper and reasonable, but there is the possibility of knowing that the property is only half big enough, but if you conclude the property is reasonable to do the business why take it then.

1424 I would not vary the intangible property at all from what I thought was a just estimate of their value, in arriving at their value but I would have to consider what is a reasonable rate. If I knew the value of the physical property I could determine the reasonable rate. In my opinion it should be based purely on the physical property. I don't admit that the proposition

that you can't take private property for public use, either tangible or intangible, without just compensation,—that is the commonly stated rule of law and is undoubtedly generally true, but there are exceptions in my mind. I don't think it would make a particle of difference nibbling it off or taking the whole chunk at one time.

I should take into consideration the amount of expenditure this company had made to acquire the business in determining the amount of this going value. Whether the expenditures of this company in acquiring the business would be a pretty fair guide there again would come the question whether I thought the expenses the company had been under while acquiring the business were reasonable expenses and were really necessary to acquire that business. If I thought they were not, the same as the rate, I would change it; I am supposed to be making this estimate. Not knowing the reasonableness of the expenses to acquire the business I would have to have some information about the conditions existing under which the expenditures were incurred. That I could find in your books of record, more here than in Massachusetts as to this particular company. I would find there the amount and for what expended, that pretty nearly tells the story. Whether that was justified or not you would have to know the general conduct of the business, the local conditions under which the expenditure seemed necessary, particularly if they were particularly exceptional. I wouldn't accept the expenditures the company had made in acquiring the property, as a whole. I haven't made any separation as to what portion I would give as money expended to acquire the business; I will give what I think you want. My idea of the way going value
1425 is built up and the items that go into it is this: You build your plant, hire your officers, manager, superintendent and even your president, if he does anything to earn the salary you pay him,—sometimes you pay him anyhow, but I might not agree to that,—the office is opened and the plant running; your officers are advertising the business, their salary is going on all the time no matter how much or how little business they get; you may hire a solicotor for special purposes to help the business, at any rate you have a corps of employes from general manager down and their time is going on and has to be paid, and undoubtedly for a time after you start your plant the net proceeds of the business are not going to meet all the fixed charges,—(interrupted as not responsive), —the class of items in the company's expenditures I regard as items that should be charged to acquire the business are a portion of the general office expenses, and salaries,—all of them which is commonly charged in the operating expenses,—a portion of them is what goes to create new business. I haven't made a separation and can't answer what proportion. When I make the computation I will cover that point. It comes back to the proposition that I haven't made this computation for your company and can't give hard and fast figures. It would have to rest in the judgment of the man making the estimate as to how much of those office salaries would be charged to acquiring new business. In addition to the officers' salaries I would include in this item,—all the fixed charges of the plant have to be considered in so far as not met, all operating

income, depreciation and interest on investment. To assume that the fixed charges such as taxes are met by the income, it is as broad as it is long if you pay the taxes and don't pay the coal bill. When you start in to build up a gas business your entire bunch of operating expenses from coal bill to manager's salary are going to overtop the income for a while and that excess represents, roughly, the
cost of acquiring the business to a man that would go ahead
1426 and try to acquire it. The excess between earnings of the
company and what it costs to get those earnings. I said the cost I took for acquiring the business was during that period when the company's earnings didn't equal its expenditures for coal, labor and fixed charges. Whether, after passing that point in the company's history, I would add anything on account of the additional business acquired as a part of the business of the company in fixing its value,—If I understand the question I would say no, because I would estimate the value of your business as of a certain date and estimate the cost of getting that much business. The thing I talked about is the business value on a certain date. I am taking into account all of the expenses of the company necessary to acquire business as of a certain date up to the time that business was acquired. Those are the fixed charges,—depreciation and interest charges, the dividends on fair return on the physical assets of the property. I consider the fair returns upon the physical property of the company as a portion of the cost of getting business, that portion up to a certain amount, or what you had January 1, 1913, just like your physical plant. I am not saying, as a matter of fact, what you have spent in 40 years to get this business is at all the measure of its value. Its value is what the well advised man would think what he would have to spend to get it, looking at the situation here now, not 40 years ago, nor 400 miles away from here, but 400 miles away might help you more than 40 years ago. It would be what he would say it would cost him to acquire that business from all the information he could get from any place. It would be the business value as of January 1, 1913 he would want to get, not measured by what someone lost, what a man gives for a property is what he thinks it is worth. The amount of money the company had spent to get its
present business would be no criterion at all,—no crucial test.
1427 What any one company expended would not be the crucial
test at all, he would have to make up his mind from all the information he could get. The cost of your physical plant isn't the crucial test of its value on the 1st of January; the cost of the intangible assets isn't the crucial test. Because a computation is hard and difficult it don't follow that it ought not to be made or can't be made. I have made computations about going value. I haven't completed any computations about this company and haven't anything definitely and positively in mind now that I would fix as the amount that should be set apart for going value. I have gone into the items but am not going to tell you what they amount to, I don't know, I will have to do that figuring when you aren't bothering me. I know I will have to come back where I will be bothered, when I have made up my mind I like to be bothered, but haven't it made up on that point so I can't give it now.

Mr. ALTON D. ADAMS, a witness for the defendant, was recalled for further examination in chief on behalf of the defendant, testified as follows:

Examination in chief by Mr. Foster:

Exhibit "412," consisting of three pages is an extract from the testimony of the witnesses in the New York Consolidated Gas Case cited as the Consolidated Gas Company of New York against Wilcox and others, and an extract from the bill of complaint of the company. These extracts are copied from the re*o*prt of the Master in the said case to the Circuit Court of the United States. I have copied the statements about "going value" in exhibit "412" from the Bill of the company as I read yesterday, and further defined by the witnesses for the company because I have long known about these statements and considered them in forming my ideas about the nature of "going value". I didn't read yesterday the state-
1428 ment of the witnesses as to their opinion about the nature of the elements that went to make up "going value". Beginning on page 2 of exhibit "412" the matter on which I relied is as follows:

"In the present case Complainant claims as the value of its "good-will" the sum of $7,500,000. and in support thereon relies on the opinions of two witnesses, Dr. Humphreys and Mr. Addicks. The defendants offered no evidence on the subject. Dr. Humphrey's testimony is as follows:

Q. Assuming, doctor, that in 1884, six gaslight corporations operating in the City of New York were consolidated, forming the Complainant Company, the Consolidated Gas Company; that one of the constituent companies was incorporated in 1823 and was in operation from 1825 to 1884; and that the other five were incorporated at intervals prior to the consolidation in 1884; that the output of the six companies in gas in 1885 was about 3,942,000,000 feet, and that the output has increased until in 1905 it was 13,283,000,000 feet or thereabouts; that the population of Manhattan Island, on which the Consolidated Gas Company is operating, is over 2,100,000 people; that it shows an increase of something like 50% in population in the last 30 years or so; that the Consolidated Gas Company has about 390,000 consumers, and is in active operation today; what would you consider to be the value of the good-will of that business, including the value of the established business, and its connections with consumers, and other elements which go to make up good-will as distinguished from its tangible plant?

A. I should estimate it at not less than $7,500,000."

The basis of Mr. Addick's testimony appears more clearly. He said:

"That in his experience, where consumers have connections and established relations with a gas company, it requires some special incentive to compel them to change." Such incentive, he said:

"Would be a reduction in rate by a competing company to
1429 the minimum extent of 10 per cent of the selling price of gas. Taking the Complainant's sales for 1905, 13,283,000,000

feet, such percentage would aggregate $1,328,300. This capitalized, at say 7 per cent, would amount to $18,875,000. or at 8 per cent to $16,603,750., as the value of the good-will."

Those are the statements and definitions of good-will that I refer to.

Exhibit "413" is a compilation of values made by me from the reported cases in the regular books—regular gas books—and in some of the instances from the reports of the commissions made to the courts. That was true in the instance of Holyoke. There the figures appearing in exhibit "413" were taken from the report of the Commission which was confirmed by the Court.

The exhibit sets out by naming the location of certain public service plants that have been purchased by municipalities; and in the next column indicates the nature of the public service rendered by the plant purchased,—that is, whether it is water, gas and electric, plant.—the next column moving to the right hand, gives the structural value put on the physical portion of the plant in each instance. By the body making the finding, that is the Commission or Court. In each case I think the finding of the Commission was confirmed by the Court.

The next column, moving to the right hand again, contains the amount in dollars of so-called "going value" that was added to the structural assets of the company whose property was being dealt with, and in those figures so far as they have all been copied by me out of the reports of the Commissions who sat in the respective cases, or of the reported cases, law cases.

The final column is adduced by me from the preceding figures by simply dividing the "going value" awarded in each case by the structural value of the physical property so as to obtain the percentage that was added by way of "going value" to the structural value.

1430 For instance, in the Kansas City Case the structural value as I read the opinion, was $2,714,000. and to that Mr. Justice Brewer added $286,000. which is 10½% of the physical property.

In the Newburyport case in Massachusetts the value of the physical structures was $235,000. and to that the Commission added $40,000. for "going value" amounting to 17%.

In the Gloucester case, another water case in Massachusetts the structural physical value was $525,000. to that the Commission added $75,000. for "going value," which amounted to 14.2%.

In the Holyoke case, which was the case of a purchase by a Municipality of both gas and electric owned by the Holyoke Water Power Company, the Commission found the value for the gas and electric plant $544,324. and added for "going value" $108,864. amounting to 20%. As I remember it the commission made their addition in the form of a percentage; they said the "going value" was 20% in addition.

In the other cases the percentages having been figured out by me in the Holyoke case I took the 20% right out of the book after checking it up to see that it was 20%.

In the San Francisco case, a water case; I believe, was in the Circuit Court of the United States, there was a structural value stated

of $24,129,389. and a "going value" of $1,400,000. amounting to 5.8% of the structural value.

It has been a long time since I looked at this case but am of the impression that it is a rate case, and apparently the lower court thought "going value" was a proper element to be considered.

In the Knoxville water case decided by the Supreme Court the structural value was $538,000. the amount suggested by the Water Company to be added for "going value" was $60,000. but the Court as I recollect, declined to deal with "going value," that amounting to 11.1%.

1431 In the Omaha case, the structural or physical value was $5,700,583. to that was added and allowed by the court $562,712. amounting to 9.8%.

It is significant, to my mind, in these decided cases, whose figures I have tabulated here, that the "going value" in each instance is stated as a separate sum aside from that stated to be the physical value of the plant, it helps to confirm me in my firm convictions that a "going value," while a real value in the sense that it exists, and is a valuable thing which a person wanting it would pay a large sum for,—is not at all a physical value, or one that inheres in physical things, as in the gas plant here in Lincoln. That is all I have prepared today on the subject of "going value."

If we take about 10% and add it to the physical assets of the Lincoln Company, taking my findings for the physical assets you will have between $40,000. and $50,000.; Taking the findings of the Company you will have a substantially larger amount for "going value," taken as a percentage of the physical assets. Here was the Kansas City case, to which the others refer back where 10½% was added; and here is the latest,—the Omaha case,—where 9.8% was added. Concerning whether the last two cases were the only cases passed on by the Supreme Court of the United States,—my recollection is, subject to refreshing it, that the $60,000. in the Knoxville case wasn't passed on at all by the court; they simply said it is there and it is not necessary to deal with it. That is my recollection, I may be wrong in that, but the amount is what I do testify to $60,000. or 11.1%.

Exhibits "412" and "413" offered and received in evidence.

Cross-examination resumed by Mr. Strode:

1432 I have not read the case of the Pioneer Telephone Company in Oklahoma, in the 118th Pacific Reporter, I will try to read that tonight. Mr. Morning told me the case was at my disposal but I haven't had tome to read it. I didn't make these computations today, I have had them for several years.

Whether I claim there could be no basis for the fixed relation between the amount of physical property and the amount of business the company has, by which "going value" is determined,—I should say no, if you mean a hard and fast rule; still, I do think on the basis of the showing here, in a matter of engineering or financial judgment, there has got to be some sort of a relation between the

physical assets employed and the amount of business you are apt to be able to do with that, in any line of business. My figures run from 9% to 20%. Unquestionably the relationship between the amount of business done and the "going value" is closer. In one case there is an effort to fix that relation, the Holyoke case. The peculiar fact of that case is they did use that 20% as a basis of determining the "Going value." If I could subscribe to that in total I would have to make up my mind; then I would tell you what "going value" was. The Holyoke Commissioners did find it apparently that way as their report shows, they say the "going value" is 20%. That was a Commission appointed by the Court to find the value of the property in suit. I think the Court must have been aided by the engineers in fixing the basis, they could not obtain the Court Order without the evidence. I know they didn't have engineers there who testified there was a fixed relation; I know some of the testimony of the witnesses in that case as to "going value." I don't think they worked it out in that way,—some of the figures for "going value" were very different from those found by the Commission, and whatever helped them this 20% they got as the figures they arrived at in this case. That is the only case referred
1433 to in the decisions, of any relation between the value of the physical property and the "going value" as far as I know. I wouldn't refer to that basis as to the first or primary method of determining it, but I would check my determination that way. Suppose in my computation I got a "going value" ten times as big as my physical assets in the gas business, I should think my computation was wrong, even though I used a method I thought was correct, I should look for bugs in it right away. If that computation should appear to be unders*ia*ble or larger than I wanted I should scrutinize it very careful. That would put me on enquiry to see whether I hadn't made a tremendous mistake; I didn't say I would disregard my reasoning. Whether, if I thought my method was correct I would care what the result was,—I wouldn't expect, if I got a result judged by their standards that appeared to be absurd and out of all common experience, I would scrutinize my methods more carefully and see if I hadn't made a mistake. Taking the same method applied to two cases, the Lincoln property and some other property giving a result that seemed all right as to the Lincoln property but as to the other it seemed too much for "going value,"—I wouldn't change the method for either property, I couldn't tell the result was too much. In measuring the "going value" by the cost of acquiring the business, the question of acquiring the physical property hasn't anything to do with it. I check back my results simply for the reason as a matter of common experience in different lines of business, you can do about so much business with a given kind of plant, bigness and capacity. You wouldn't expect to do $10,000,000 worth of business with your little gas plant; so I should say there was something wrong in that method and would look it over, and would find something wrong with it most probably, if I got into such circumstances as that. I would stand by my method and if I got

an absurd result, if my scrutiny convinced me my m-thod
1434 was sound I would hang to it. In this case, if I got a result within 20% of the physical values of this property, whether I would hang to it would depend on whether I thought my method was correct; I should not hang to it because it was 20%. I should not throw away my result if I found it was 20%, neither should I throw it away if I found it was down to 5% or 6%. Here is one for 5.6%. I haven't suggested that just taking a percentage of the physical property is the usual way. I said that the Commission in this Holyoke case does it; there are other methods sometimes employed, for instance, to allow so much per service. Engineers might do that as a short cut to an easy result, I have heard such things discussed. I never did it. Taking the cost of getting the consumer and multiplying that by the number of consumers is mentioned as a possible method, I didn't say it was quite frequently employed such as taking $30 per consumer or connection, I know that has been discussed. I never knew of engineers to accept 20% additions to the appraised value of the physical plant as another method employed. I know Mr. Floyd as an engineer of standing, I have been on the other side of cases before now, he is a friend of mine, but I would not accept as primae facie true what he might say about a matter of that kind; Even where he was writing a book on the subject, I don't accept statements at any time, not saying anything about Mr. Floyd, he is a bright man and an engineer of standing and reputation.

Whether I would hesitate to accept his book because he is an engineer, or because he has any interest other than to represent the matter in a published book as he sees it,—I would say, if you want an answer to that question, any gentleman, who commonly appears right along for corporations, when it comes to writing a book or paper before an engineering society and expresses his opinions about values, while I don't necessarily disagree with them, I scrutinize them carefully, because I can't help having in mind his occupation and the way he gets his living.

1435 I don't say absolutely that where a man's interests lie, it would influence his statements and opinions or conclusions, even though he was an engineer supposed to be testifying or giving statements about matters more particularly within the knowledge of engineers; it might; I think every man's mind is apt to be influenced and colored by the nature of his employment and the contentions he is in the habit of making and trying to support. I think that would influence his conclusions in the valuation of property if he were employed by a company generally. It might, I am not going to say about Mr. Floyd, he is a very pleasant acquaintance of mine. I simply say that any gentleman who is appearing habitually in valuation cases is apt to get some bias from the contentions he is in the habit of making right along, I think that applies to myself, and I am not making any accusations of improper suggestions about anybody. That might affect the cost of water gas, he might think he was looking at it from the standpoint of better power, as your

witness did when asked about a price a good deal less than he gave. There is two ways of looking at it.

Figuring on a valuation as a whole you must figure on what you expect to pay in the ordinary course of business, but I think there is some chance for differences in opinion,—if a man is working in the interests of his clients and their interests demand high values or low values he may conform to it. I don't say he would or would not. I think a man would get his mind where he would rather see the high side of things if he was trying to help people who wanted their things to be very valuable. I think it is almost inevitable. It is well known in the engineering world that engineering structures and machinery costs different amounts according to what care they are built with and designed and all that. Not like the company's witness Campen who estimated that the mains for two months in the year would be laid through 4 feet of frozen ground, while I valued them to be laid in the summer time; there is two sides
1436 to the proposition, and I think I am permitted to say what I am permitted to on both sides, at least I have said it. I think that the elements that go to make up the "going value" in the Consolidated Gas Case were defended substantially as I defined them here. The court did not exclude those elements as an element of value but as an element of a rate. I don't understand the court said there wasn't any such kind of value; but I understand the court didn't admit those elements as a basis of rate making. The treatment of the matter I referred to is headed "Good-will" in that section of the Master's report, but the talk of the Master in the section is about franchises. I don't remember that the term "going value" is mentioned in this case. I think it is true the term "good-will" was presented in the complaint and considered by the Master. Whether the Master in considering the "good-will" distinguished between good-will and going value,—I don't remember what the Master said about that, if you will show me the book I will answer you.

Attention being called to this paragraph of the Master's report,—"Outside of the proof that Complainant had secured control of a majority of the stock of each of the other existing light companies, no evidence was offered in support of the above allegations, but, assuming them to be well founded, it seems to me that they are predicated upon an erroneous view of the meaning of the term "good-will" as involved in Complainant's claim." — —

I don't agree with the statements you make, I do find that the Master says "This kind of good-will amounts to a "going concern", that is found right above line 335. This is the Master's report and is an official document. When the Master says "no proof was offered, etc.," I don't understand that he is talking about good-will, he is talking about the immediately preceding allegation. He also says: "It is not necessarily the ordinary commercial "good-
1437 will", such as attaches to an old firm name or place of business and is based in large degree upon the personal standing of the founder of the house,—" He says it isn't that thing.

And he says: "The modern decisions have recognized its proper

scope as including that species of intangible value which comes from the gradual building up of a complete organization in the successful operation of a going concern. Such value can exist in the case of large corporations, notwithstanding public disfavor, unless its disfavor reaches such a point as to result in the absolute destruction of the business, an instance where good-will of this description was considered by the court was in National Water Works Company-v-Kansas City, 62 Fed. Rep. 853, which was a condemnation proceeding."

That adopted the view of good will as defined in this report and that was the same thing Justice Brewer talked about. I want to correct what I said about "going concern" value being mentioned here. I now notice, on refreshing my recollection, that "going concern" is mentioned by the Master. "Going concern" is the thing which he is talking about to which the value attaches.

Whether I regard the "good-will" known to the Common Law and known to the private business the same as what is regarded as "going value" with respect to a public service company,—I don't regard it the same; I regard it as similar. Whether that value is determined in the same way as the value of the "good-will" in a private enterprise is determined,—I think there would be some variations in the computations. I never computed the value of a private concern in that way, so I should have to think the matter over before I should be able to tell you what variations would be necessary, if any, in the computations.

There is a very important difference in the valuation of the business built up by this company and the necessary expense in building it up and that of a newspaper in this community. The newspaper would have to build up its business in the face of
1438 competition and would be to that expense; the computation involves not only the building but the holding of the business, and the value of the business would be affected if it was for the time exposed to competition, they might take it away. Outside of that element of competition I think they would be very close together. If the gas company was exposed to competition I would not value it in the same way as the newspaper, but as to just how much difference there would be I would have to know about the competition. It is almost unthinkable that a gas company should be subjected to any such degree of competition as the ordinary newspaper plant. I do not recognize that the gas company is exposed to any direct competition. To compete in the matter of lighting as between the gas company and the electric light plant I don't think it is direct competition,—not what I call competition,—because every coal oil lamp or tallow dip is in competition but it isn't what we call competition—direct competition. I lay stress on the word "direct", it isn't direct competition. Here is a gas company and an electric light plant, the electric plant gets all the business, but I distinguish again between the "kind"; with two services like two electric services and every kind which you get when coal, coke, or charcoal competes with gas, or when electric light competes with the coal oil lamp, there is competition in all those cases, but is a different kind, or degree,—I call it direct or

indirect for lack of a better phrase. I think that might enter into the determination of the valuation of good will when existing, whether direct or indirect. I think there would be some difference in the method of computing "going value" of a strictly private business, I think it would right along the lines parallel with a public service business. Whether the percentage of "good-will value" would be expected to be much greated in a private enterprise in proportion to its physical property than in a case of this kind,—that would all depend on whether it was a famous surgeon or a wholesale grocery house, it depends on the line itself you are in
1439 so that you can't liken different businesses and draw a conclusion from them because the ratio of assets to the different businesses is very different, in so far as the ratio exists. I don't think the franchise would enter in any direct way into the consideration of the value of the going business element. I was not asked about exclusive franchises. I don't attach to that value of that property because of franchise rights because I think the going value is a thing separate and apart from the rights to carry on the business; the going value is the value in the business. One man may have a right to carry on a business, another man may have the business which he can sell or let die. In determining the going value I should assume the continuing right of somebody to carry on that business, a man wouldn't buy a business that was illegal to carry on. I think the going value is independent of the owner, whether this company or somebody else. The suppositious purchaser looks at the going value and any common rates that are charged up to that, he said it is worth so much because I can get it for so much expense rather than build it up myself, and I will give so much for it. I think that is what it is worth. If it was against the law in Nebraska to operate a gas plant that would kill the going value. I assume they would have a right to use that property for that service indefinitely, otherwise it would knock the spots off the going value. I am not going to construct any hypothetical plant, I may assume in valuing this business that the business may be carried on indefinitely. I assumed the time it would take to reproduce the Lincoln plant, and parallel the business it had January 1, 1913. I am not assuming a plant is going to be built, I am assuming what it would cost if one were built. The plant I valued is this plant, not some other that never was or will be. I propose to value the parts of this plant that are used for the Lincoln business. Not some other plant that never was or may be, but I have to look around and see what things cost,
1440 that is the method. I may enquire the price of pipe in Chicago or St. Louis, but what I may have is the value of your plant.

As to my practical experience, in the manufacture of gas, such as this company furnishes,—I have been watching the operation of gas plants and analyzing the results from operations, just as your engineers do here, and as all engineers must,—for the last 15 years. I have never been employed in or about a plant. At one time I gave a company some advice about the charges and method of running

their business. As far as operation the plant, being active and sharing in the work necessary to be done, I have been there and watched the work done, I didn't turn the levers. Whether I had had that experience with this company or any other,—No, I claim what I have done in connection with the gas business is engineering experience. If you want to know whether I have been employed by any gas company, I can answer very shortly, I will not testify that I haven't had any experience, because I have had 15 years of it, in connection with a good many whose results I have watched and analized, and I did it just as truly as any engineer that might have been in the employ of that corporation that stood by my side and made the same figures and comparisons, because the company paid him, and my client paid me. The information was gotten from the reports of the company showing the results of their operation, or from visiting the plant just as the engineers of the company did, to see how they worked, and would go up and look at the figures and see what the results of the work is, I call that experience. And that is the kind of experience I have had. I have never carried on the duties of a manager of a gas plant, nor been employed in connection with the management of any gas company, neither at the plant or in the management of it. On one occasion I did give the company some advice about the management of their business for which I was paid.

I have had experience in the installation of gas equipment, I never was in the employ of a company. That experience
1441 was not in installing that machinery for the people who furnished it, but for the use of those for whom it was installed, yes. Not for the company that purchased it. It was for the public, they had to pay for the use of it for some time and had to pay for the equipment too. I appeared in the relation of someone representing the public, that is the way I have appeared in my experience with gas companies, as the representative of the public. I never had any experience on behalf of any gas company in the selection of any equipment. Neither for any gas company in purchasing pipe for mains or laying mains. I was always acting on behalf of some portion of the public.

As to where I acted for the public either in acquiring equipment, installing it, or acquiring any part of the distribution system or pipe of the gas company,—take the Haverhill plant in 1911; the manufacturing end was almost entirely rebuilt during that year that we were trying the gas rate case for Haverhill, and I was at the plant a great deal,—went through some dozen or 20 contracts for equipment for that plant, which the company kindly furnished. Those were contracts that had been made. I was never called upon by any gas company to determine whether a kind or piece of equipment should be installed or not, but for a municipality in one instance, I was called upon to make such a determination but we never got to the point of installing the plant. I made an estimate and specifications about it and the thing is hanging there, and I don't know what they are going to do. It has been hanging there for *w*uite a number of months, that is at Ypsilanti, Michigan, as near as I can get at it.

Referee: It seems to me this has gone far enough to show that Mr.

Adams has had no practical experience in the sense you use the term, you and he don't agree on the definition, but the evi-
1442 dence is very plain. Exception.

(Witness continuing:) I never operated a plant for a municipality. I have operated a large business where I might be required to incur obligations that might be more or less incidental to the business, in the electric lighting business, for instance, and the manufacture of electrical machinery. I had the management of such business, and am somewhat acquainted with the incidental expenses of that business. As to the latitude existing in the conduct of such a business dealing with a large portion of the public where you have to give to charity,—the term "have to" is a strong term. If you say have to I think I should say no. You "might" do so, you might make a moderate contribution to charity. Whether that is good business sense and judgment to pursue that course,—that is subject to all sorts of qualifications. You might, in the exercise of good judgment, give moderately to several charities I think. It might be good business judgment to a very moderate extent incur the expenses in keeping an organization,—every man in good working harmony. It is often convenient, if the boys are working here at night, or have some trouble, to take them in and buy them something to eat or a cup of coffee, I should not hesitate to *to* that. I should not criticize necessary and reasonable expenditures for the men who are employed by the company and who needed, for instance, a meal of food or what not, when they were out in the service of the company, or out in that connection.

Whether I would criticize the expenditure for getting the heads of departments together quite frequently for talking business matters over,—I would say that is all a matter of degree; if it was a case of car fare to ride to some central point, I should not criticize that. I could tell more definitely if instances were cited.

I don't think the bare fact that when several persons employed by a public service corporation occasionally take lunch to-
1443 gether at the expense of the corporation, that that is a subject for violent criticism, it would all depend on the extent to which it was carried; sometimes, I can see how such a privilege might rightly be abused if it ran into a big supper that involved the expenditure of a good deal of money, that would be a different thing. Not knowing what the present practice by well conducted business houses, in providing shower baths, lockers and other conveniences for their workmen, and even free meals at noon for help, is I can't testify at all about that. If that is the situation if not carried too far the mere fact that certain persons employed by the company ate lunch together at the company's expense, if only carried to a reasonable extent, like an equal addition to their salary, for that is what it would come down to; it might be abused and that would be cause for criticism. Expenses incurred for literature we don't run into any trouble on that, but the expenses in attending gas conventions a good deal depends on what you get there. It don't cost a great deal to attend and discuss scientific papers, but if you go for a junket on the same trip and have a pretty good time and spend $100. extra

that might not be a very good item to write in the expense account. I agree to the principle of having a person or two or more, whatever suitable and necessary in a given case, to keep in touch with the advance in the engineering business matters and to attend association meetings for that purpose at the expense of the organization they are connected with, would be a proper item of expense in the manufacture of gas, but the mere fact that they went and spent a lot of money wouldn't authorize all the money they spent. I don't know if it would be outside the work of manufacturing gas, you have got to keep up with the progress of the business and the art. I should consider, if I was the manager of a gas company, and attended a convention and read a paper or took part in the discussion that I was serving
the purposes of that company just as though I was at the gas
1444 plant.

Exhibits "1" to "6" inclusive offered and received in evidence.

I presume I have somewhere, but have no copy here in the room, of the report of December 25, 1912, being a letter to Mr. Foster touching the earning value of this company's property.

To the best of my present belief exhibit "414" is a correct copy of that report; I state that subject to correction if I find that it is not.

Exhibit "414" offered and received in evidence.

I am not a practicing lawyer. I never carried on a law business. I had on the door of my office, where I really carried on an engineering business in Worcester the year after I graduated from the law school, which was in 1904.—I had the word "lawyer" following my name, but I was absent from the office myself all the time on engineering work, as a matter of fact I never engaged in the general practice. I can't say it was my purpose when I opened up my office to practice law. I wasn't sure, when I put the word "Lawyer" on my door what I would do, I had a good engineering practice at the time; I suppose if lots of clients had come in a crowd why I might have given up engineering. I never saw any parties and my engineering business increased and my law business didn't, so I took the word off the door and it hasn't been on there any more since. I substituted on the door "Engineering", I had been an engineer for 25 years before that, having gone through the law school I was guilty of the folly of having the word "lawyer" printed on the door after my name and I saw the folly of it and had it taken off. I have tried hard to live down that mistake since.

I have referred to a number of cities and towns where I have participated in the matter of rate hearings, certainly. Watertown, New York, may have been the first one I referred to; I had been in two or three before that. I was in the Watertown case. There I made an examination of the company's property to determine the physi-
1445 cal properties of that company. As to the time spent in the examination before reporting on its valuation,—I can't remember now, it seems to me I was there over 3 weeks or so; I wouldn't make any estimate of the time I was actually there at the plant, I was there a good deal of the time in the company's office going over the records and visiting the plant. I valued the physical

property based upon a physical inventory where I valued each item of property and reached a total valuation of the physical property. I think I examined the operating accounts, some of them, and made a verbal report, that was a capitalization case: I don't remember that I gave testimony before a tribunal, I don't think I did. I did give a detailed report, based upon an inventory, on the valuation of the physical properties of the plant. I only wish to vary from that for the purpose of accuracy, I didn't make any report at all, I valued that property and testified as to the value before the Commission. There is right there before the Commission a detailed valuation specifically and separately of the different items of property. I didn't rely entirely upon the inventory submitted by the company. I investigated in every way I could, by visiting the plant and looking over the sworn returns before the Gas & Electric Light Commission at Albany, and going over the records of the company; it wasn't based merely on a sheet of paper; I spent a good deal of time with the company's records and at the plant and with the reports to the Commission. That was on the part of the company to issue securities and stocks and bonds both. The purpose of taking the testimony was to find out the value of the company's assets with reference to an issuance of securities. I didn't testify about the securities. I testified about the value of the physical things. The question of rates was more or less up there. That was in 1906, and while, as I remember, I didn't analize before the Commission the operat-
1446 ing expenses of the company, my impression is that on the basis of my valuation, and the using of my valuation, the City got some sort of a rate order at a proceeding at which I wasn't present, subsequent to this capital stock proceeding. The Company had the property valued by an engineer at the same time, I think Mr. Breeder, of New York.

I valued the company's property at Saratoga Springs; that was both a gas and electric property—that was true at Watertown also. As to the time I gave to the valuation of the property at Saratoga Springs,—I was there substantially a number of days and visited the plant a number of times; I spent a good many days making my computations and assignments of value, I can't begin to tell you th*ime* now, it might have been a month, or six weeks that I spent altogether on that. I was not furnished a detailed inventory, except as I hustled around and got it, of course, the reports of the company were on file with the Commission at Albany; I visited the plant and got some information from their office, in the way of drawings, as I recall, and I presume some figures. I have forgotten where I got all the information, but from all the sources I resorted to I got what and all I could. Saratoga Springs is a place with a big name and small population, perhaps 10,000. I think the gas rate there was around $1.70; I think they manufactured both coal and water gas,—I am sure they had a water gas set. The larger companies in Massachusetts,—anything like as large as your company here,—with two exceptions, Fall River and Haverhill, have combined coal and water gas plants. I regard that as good practice: in Massachusetts at Haverhill they said it wasn't, I tried to impress on them it was.

I valued the property in Salem and had a detailed inventory and valued each item of the plant and added the items together to get the total. I don't remember how much time I gave to the actual examination of that company's property,—I think I was act-
1447 ually down at the works a couple of times, at first the company were quite willing to have me come, but after that they were quite crusty and said I should not come in there, and I went down and looked over the fence considerably and freshened my mind. When we speak of being on the company's property, it frequently happens that more than half of a company's property lies around the street. The group of machinery which we call the gas works isn't half of the property, in many cases. I think it is a little under half in this case. You must have some knowledge of the equipment by actual inspection, and would want to look over the fence at least more than once. You would want to inspect the equipment enough so that you would know it is in shape to be operated and all that sort of thing, and get some idea of its condition.

I did some work in connection with the gas plant in Woonsocket. I have forgotten in how great detail my valuation there went, my recollection is that my own personal notes went right through in toto as to the different equipment, I don't think that detail was reflected in the printed report made to and by the City. That was not a great proceeding, it was a proceeding out of court where the City got a report on the value of the gas property. I think I dealt with the Mayor, probably the report was directed to him. I visited the plant several times and made up a schedule of the equipment.

In a sense I valued the plant at Cedar Rapids, I can tell what I did if you like. I testified as to the value of the plant, including the value of the physical property. I didn't testify about any business values there. As to the length of time I was in Cedar Rapids examining the property before I testified, it was comparatively a short time, I wasn't called into that case until late while it was in progress. I wasn't in town more than a week and perhaps I was somewhere else in the intervening time. It was less than a week that I spent actually on the ground. They telegraphed me to come there. I didn't testify that I prepared myself in a week to testify, I
1448 may have come there and stayed 2 or 3 days and got some information about the plant and then gone away. I haven't any recollection now whether that was the fact or not. I don't remember that I criticized the operating accounts, aside from the depreciation claim, I criticized that.

If I said I valued the property at Attleboro I think I put it a little strong; I was connected with a proceeding there where the value of that property was in question; I didn't technically value the property but gave testimony about it. I presented a schedule showing the approximate or suggested values for that property to the Commission, based on the property actually there. I was there a number of times during the hearings and went over the plant as often as I wanted to; we had a pretty good line on the equipment there for we had 25 years of the record of the equipment piece by piece in Boston and I had some drawings of the outfit there. I made an examin-

ation of the operating accounts. I do not recall how much of the operating expense was carried into the item of "salaries and officers expenses, I could get all that, I can't carry all those figures in my mind.

I valued the gas property at North Hampton. I don't know how much time I gave to that valuation, I haven't made them a complete bill yet. I spent a good deal of time on that.

Going back to Attleboro I think I spent more than 2 weeks on that. I spent a number of days in the North Hampton case, I should say more than a month.

I spent considerable time on the Haverhill case, that was tried during the whole year, we had 26 hearings, and I was plugging between the hearings, it began in January and ended in December. The lawyers took advantage of the continuances, I worked as hard as I could in the meantime. I have worked hard here all right, if that is what you refer to.

I don't just recall my basis of valuation in the Haverhill
1449 case, I have a copy of my valuation here. As to what particular city I used as a basis of the cost of mains in the Haverhill case,—I have never used any such basis as that; I always use figures made up on my best judgment.

Whether that best judgment was justified by figures of actual experience of any city,—I think I referred to a number of places, I got some other costs there at Haverhill and costs in Springfield, Massachusetts and various places. I determined there the real estate value of the Haverhill plant. I didn't have occasion to determine there the amount per square foot the company was justified in expending for real estate for its plant, not in any such general way. I did testify there about the necessary amount to be expended in Haverhill per square foot to get a suitable gas site. I don't think I testified here that my observation and knowledge led me to believe that 2½ cents per square foot for real estate for a plant is what is commonly and generally accepted as a fair amount to be paid. I don't think I gave that testimony. Whether I recall that I gave the statement here that my knowledge of gas plants throughout the country led me to believe that 2½ cents was a sufficient amount for a gas company to expend for real estate in its plant,—I didn't put it quite that way, I probably testified to what was an ordinary and fair amount, I wouldn't say it was enough for any gas company. I might have said that that was enough in a good many cases. I should not hesitate to say that.

I didn't law down any such rule in the Haverhill case, that from my study and observation of Massachusetts cases led me to believe that 15 cents a square foot for real estate was a sufficient amount for real estate for a plant; 15 cents a square foot would be very excessive. I have a schedule of the valuation of the Haverhill plant. I never have made, or presumed to make, and never shall make,
because I don't know of any such sweeping opinion about
1450 the amount that should be allowed for real estate in the Commonwealth of Massachusetts, which has gas plants all the way from Boston down to small plants; I have always qualified

any opinion I have given about the fair cost of real estate according to the circumstances of the real estate I was talking about. Any general statement I have made here in substance that 2½ cents would be a fair amount, based upon the experience of other companies, would apply in a good many instances in Massachusetts; it wouldn't apply to all the companies. Whether it would be a general rule or have any value in it in determining the value of the real estate in this plant,—it would throw a little light on the fair value to allow for the land, but it would be subject to very decided control by local conditions and circumstances.

I have in mind now a figure that I regard a proper amount for a company to expend for real estate for its plant; it would apply in a good many cases, it wouldn't apply in all cases. I can't test the value of the land finally, in any place by simply such a general rule as I would give. I would tell you that in a great many cases land from $1000. to $1500. an acre, good land, can readily be had,—good for all purposes of a gas plant site,—that is a very common thing to find. I am not saying that in every place you can get land for that, or that land is only worth that. I tell you that is a thing you will not find confined to Massachusetts or elsewhere. When I come to value the land you have there, that general rule would have a little influence, it wouldn't have a controlling influence over local conditions as I found them. I should go on the situation with the idea that $1000. or $1500. an acre was in many locations about right for a gas plant site, but that would be subject to control, I should know it was too, what I found locally. I might and do find situations where that doesn't hold good.

I designed a plant at Yipsilanti, Michigan, and furnished specifications for a gas plant there,—I made a start part way along
1451 in completing a design for a gas plant there, they sent me word to hold up and not put any more expense on it until they found out whether they wanted to build, or to to buy the existing plant. I made an estimate in the first instance. I may have that down at the hotel, if I haven't I can readily get it. That included an estimate of the cost of construction of the mains and services,—of the gas plant from buildings to meters. That was filed with the City Officials of Yipsilanti, I gave them a copy of the report. I think the population of Yipsilanti is under 10,000. That report was furnished last year. There was a gas plant there, and the desire as expressed to me was the City wanted to either build a plant itself or buy the one there. Whether they tried to buy the plant there,—I don't think that is quite right; the general movement was to determine what a new plant could be built for and then see by comparative figures what the old plant could be bought for. Whether the City of the Commission in Michigan had the power to regulate rates, that is a matter of law that I don't know that I can testify about.

Melville, New Jersey, is a tax case where I valued the gas property for the purpose of taxation, in 1912 I think, or 1913. I gave a number of weeks- time to that case, I was down several times and spent a day or two and devoted a lot of time to it in between trips.

I valued all the physical property including the water plant, electric plant and gas plant. Melville has about 10,000 population.

At Racine, Wisconsin, I had two cases there, I am valuing the water plant now, I had to do with the gas plant, I have forgotten how far I went in the valuation of the gas plant. Whether I give a valuation of the different items of physical property of the plant or just give a total valuation of the whole thing,—I never give such a thing as a total for the whole thing, what I did, I gave this subject a careful examination,—The Engineers for the Wisconsin
1452 Commission got the schedule and valuation of the Racine gas property, and I took that schedule and visited that property and made up my mind about the values, or portions of it,—I think particularly to the main system,—but my recollection is I gave testimony as to the values of a large part of the plant. I think there were some elements in the Wisconsin Commission's value that I didn't disturb.

Whether my testimony wasn't based particularly, if not wholly, on the extent of the street mains and the weight of pipe and the cost, and a criticism of the company's report upon that item,—would say, I think I went to the extent of valuing a large portion of the property of the Racine plant, but just how much of the manufacturing plant was included I am not now able to recall. I was not there a long time, I think I was there only a very few days in the City, perhaps not more than a week, perhaps I spent some of the time away from the City in making up my figures; the hearing at Madison took some time. When I was away from there I had the Engineers valuation that I went down and checked over and took that away with me.

I referred also to some work for The National Civic Federation in both gas and electric properties; it included companies plants that were operating both gas and electric services. The report dealt unquestionably with a number of combined gas and electric plants; I don't now recall that I valued the gas end of the business. In the case of eight municipal plants I valued the electric end of the business, but out of consideration of the private corporations I let them off and didn't value them. The investigation dealt with 8 private and 8 municipal plants in Massachusetts. As far as I am concerned, my impression is it dealt with electric equipment; those volumes that contain my report are in the Library here and can be looked at; I don't remember that I valued the gas plants in connection with the electric properties, my impression is that I only dealt with the electric end of it.

1453 When I appeared before the Industrial Commission of Congress that was on the analysis of the results obtained from municipal ownership as against private ownership, it was reduced to dollars and cents figures. Whether that was a public hearing where anyone got any opportunity to be heard and could be heard,—maybe so, I can't tell you about that. Different views about industrial life were presented to this Commission, it is in 20 volumes, there are a great many views, and on a great many subjects. I presented a statement as to the results of earnings,—and I think rates,—although the earnings applied to a very large part of the

testimony I gave of the municipality owned and privately owned plants in Massachusetts. I don't remember that I dealt with the gas business of any of the plants. I dealt with the electric. I rather think the report was confined to the electric end of the business. I could look those volumes up, they are in the Library undoubtedly. There I would not require information particularly about gas,—general engineering and accounting information was required, not relating particularly to gas, unless I dealt with some gas properties, which I do not now recall that I did.

The data I had is not only disclosed in the forms they get to fill out, giving the total amount of gas manufactured, coal used, and labor expenses and different items entering into the manufacture of gas,—it is very much more extensive than that. That is a part of it, but it is only a part. I know that the form and details of the operation of these companies that you find in the public libraries throughout the country in published volumes, is not such details as you find in the office of the Commission. I had access to the published volumes of reports of the Commission of Massachusetts, but so far as that they don't carry you to any such extent as the records. No, it isn't true that it gives you all the results except the minute details. I don't go very far at all about physical
1454 properties. You can only get meagre results about the plant, but you can find out considerably about the results of operation generally, but when you come to the cost of the plant and what the equipment is and all that, you can't get a great deal out of the reports. You just get a summary statement of the assets. But getting into the office of the Commission, where you not only have the original returns, of which I now show you a copy, but where you have the drawings and a great amount of detailed data, which the company have to bring in in their applications for stock. The testimony isn't sworn to now, the Commission doesn't swear them now, but their reports are sworn to. When they apply for stock they are not put under oath but they have to give a great deal of information about their plants, and tell the cost of their structures, and note and describe everything; and bring in their original contracts and all that sort of thing, and that is on file in the office of the Commissioners, and that is what I referred to in saying I had found out a good deal about gas properties by studying the records there. Whether the only information you got that way would be by a comparison of one company with another largely to see whether the operation of one company as compared with another was better and more economical,—I would say no, you would find what specific things cost—here is a million foot holder, a 500,000 foot holder, a water gas set or the mains laid. The returns don't show the cost of laying mains so much, although you can in some years get a good deal of information out of them, but the testimony and exhibits in these stock cases show in minute detail the cost of laying the mains as reported by the managers of those companies, when they come in for their stock. In reading the testimony of the witnesses before the Commission and the reports themselves, and there

is a great deal about the cost of equipment or the cost of
1455 mains. Whether a specific item—say a water gas set and scrubber,—that doesn't appear as a matter specifically, but you follow this down company by company for 25 years and you will catch a good many reported items,—specific items of property—with the reported costs therefor, in all sorts of cases, equipment, buildings, land, mains and all right in these sworn reports.

I had nothing to do with the testimony with reference to the valuation of the Des Moines Gas Company's property.

In making up my valuation here, with reference to the method I pursued in determining the value of the physical property of this company,—I tried to make up my mind, in general, as to the cost of producing a like thing to the thing I found here, taking up all parts of the plant in detail that was operated down there, for instance, the old steel holder down there. I took up the value of the meters by themselves, whether I valued the meters first or the mains first it is past me now. Whether dealing with a list of fair completeness I should say no, there might have been some items lacking from my list when I made a part of my valuations, but in the main I should say my knowledge of the items that went to make up the property was complete before I made up a value of any of them. I don't think I could have put a valuation on any part of this property until I had a complete detailed report of the company's earnings, because I had the United States record which contains a detailed report of the earnings, at a very early point in the case. I think I must have had that before I put a value on anything in the case. Whether I had access to the company's records, and had all of the operating expenses, and annual reports copied and a detailed statement of all the company's earnings before I valued this property,—would say it may be possible that some of the years have been copied by my stenographer, but that copy wouldn't vary
from the copy of the Supreme Court record of the United
1456 States if I had it. Whether before I started to value the property I brought those reports down to the close of 1912,—I have no recollection that was done, if I did not, I certainly had no complete analysis of the figures, just how far the stenographer had gotten on the copy at the time I made the report for the City Attorney about earnings, I wouldn't dare to say. Talking about this last valuation I made yes, I think I had a complete copy of your so-called gas reports, which set out the income and expenses of the company down to the end of 1912, I haven't valued it beyond 1912. In analyzing those reports for the purpose of criticizing the operating expenses I have not entirely depended on the integrity of the copies made by the stenographers sent to the company's office. I have not myself checked in toto the copies made by my stenographer, I have checked parts of it myself, all of my copies were not made by my stenographer, part were made by Mr. Wiggins, Mr. Wiggins at my request checked these reports in the way that I indicated to him, sitting right there and having the report read off to him and checking it off. It is my impression that they have all been checked, as I said here that they have all been checked. I think I have

accepted the company's inventory of its property, pretty generally to base my valuation on it, and by that I mean I have accepted the statement that those things are the property of the company and are here. I had to make an inventory of the company's property when I made the valuation. I have the inventory made up from your records. I compiled a great deal from the records in the office of your company, in reference to mains, meters and pieces of machinery. I don't now remember where I found a piece of equipment lacking that your inventory hadn't reported, of course, your inventory about mains differs some from what I got out of your records, but for the purpose of avoiding a dispute on that point,—as the difference wasn't very much when you finally got through with your investigation,—I took your figures for the mains as appears in Mr. Lea's report. I recognized that he had some
1457 difficulty in getting that figure himself, and thought I wouldn't put him to any more trouble, prior to that I had been through the records and knew what the records showed. In the valuation of this company's property in 1907 and also in 1913, I have not included anything of any value for the item denominated as "going value", except in this way: That term "going value" is used with different meanings; I have know- it to be used sparingly with the meaning, as one also expressed it, of simply having the bearings greased and the belts on and things ready to turn around. I valued all of your property on that basis. I haven't valued any of your property as junk but as useful and ready to be used in the gas business, or that was ready to be used and being used, but I have not injected into it any business value. I haven't injected a bit of this value I have defined as "going value", but that other kind that people sometimes talk about I don't think is "going value" at all. I haven't included that. It is a kind of going value which means the plant is a going, usable and used plant, all of that value I have included, but no intangible "business value" have I included. I allowed $20,000. for working capital, that is the extent of my allowance, prior to that I had added nothing. In the valuation compiled prior to yesterday there was nothing included for working capital. In the operating expenses I omitted the taxes, they are shown just as they are shown. Referring to the 2.5% of the gross receipts imposed upon the company as an occupation tax, to the best of my recollection at this moment that is written into your reports—I took all that was shown in your gas reports. I don't remember that my analysis shows that figure. If that 2½% of gross receipts hasn't been taken into account by me up to this time, if that is the ordinance, I think that would mean 2½% a thousand off for gas at $1. a thousand, but I am taking all this on your statement, I don't know anything about this occupation tax. Whether instead of being $1 gas upon my figures it would be 97½ cents, I should not
1458 figure it that way. I should figure the gas at $1. and the tax in addition to what other taxes there were to the 2½, it would come to the same thing. If you had to pay that 2½ cents you couldn't avoid taking it off the $1. I should want to take that into account as a part of the operating expenses. If that had not

been taken into account in estimating your net earnings on the $1. rate I would most certainly have to reduce my figures if you have to pay that tax. If it is a legal tax burden I would have to take it into account. If it stands as an Ordinance in the form of a Court Order before feeling justified in making that deduction I should want you, or some other good lawyer, to advise me about the probability of this thing being finally sustained. Whether as an engineer I would make a deduction for it as soon as it was put in the form of an Ordinance of the City and a judgment of the Court,—I think if the matter were simply a contested Ordinance, and on which good lawyers claimed there was no legal effect; I don't think I would deduct it. I think that would be a matter of argument before the Court whether that was to be deducted or not. I couldn't assume to decide the case or deduct it. I think you could show what it was if it was enforced, and what it would amount to if it wasn't enforced. I think that would be proper, but I couldn't undertake to decide whether that was a value or not.

Whether on the item of working capital I gave $20,239.20,—will say my testimony was that $20,000. was right for it. I stated that those exact figures, $20,239.20, was not to be taken as a precise statement. I fixed on $20,000. as the amount in toto, the added dollars is a small item. I don't recall whether the court in the former hearing in 1907 allowed $50,000. I don't remember what the record shows. I should not change my figures, unless the record discloses something that I have overlooked. I tried to indicate in my direct examination that the basis of the monthly expenses plus the
1459 coke, coal and oil on hand gives a pretty fair item of the nexxessary working capital. I take the total expenses of the company for one month and to that I add the items of coke, coal and oil on hand, providing you take the coke, coal and oil in the situation they were in 1912,—of course if you take 1907, that wouldn't hold true because your coal was already included once in the expense for coal and labor. I would add the gas coal in, but in 1912 you bought your coal and paid money for it, but you didn't buy the coal for the same purpose so I added the coal.

Whether I would take any particular month's expenses and add that amount of coal, coke and oil to get the working capital for that month,—I wouldn't bring it down that precise. What I did here was to run down through the year 1912 and take out the largest total for the monthly expenses, and the coal, oil and coke on hand that I could find during the whole 12 months, and without accepting that as a hard and fast guide, I do think,—taking into account everything I do know about the matter,—and taking those figures into account, that sum for the year is a very amply working capital. I take the amount of coal, coke and oil on hand because the company has an investment in that for that amount. Whether it is because it is coke, coal and oil that I take it into account, or because the company has that amount of money invested in those particular supplies,—It is for both reasons. If it had that amount of money invested in bricks I should not allow it, but coke, coal and oil are used and have to be used and you have to have some of them. As to the company having

that amount of money invested in that amount in any broad sense that may be true; if taking each month it should turn out by their vouchers and bills that they had paid out that much money for coal, coke and oil on hand they had that much value in material there. It was because coal, coke and oil are supplies that are necessary, and because that amount of money is invested in supplies necessary in the manufacture of gas for the use of the company in its business.

1460 It would not follow at all that any other supplies the company is required to keep on hand in the conduct of its business should be taken into account just as much as coal, oil and coke. But any other supplies the company has necessary to be used in the manufacture of gas I should want to take into consideration, if gas appliances are referred to I don't recognize any obligation to the agency distributing gas to the public to keep gas appliances on hand and charge the loss of keeping them to the public. A man is entitled to have his gas free from such losses to the gas business. Gas pipe and gas mains are carried in stock for the distribution of gas would not be as much a part of working capital as the coal that went to the manufacture of the gas. I distinguish between the portion of the supplies carried for the distribution of the gas from that carried for the manufacture of gas because I have already allowed for the loss of interest on the pipe for construction purposes by the interest in the value of the plant, in the 7% on the other structural costs of the physical plant, computed on the plant that is actually in use, and upon the supplies carried in stock but as to them computed to cover the cost and loss of interest on the cost of the plant in use, before it went into use, and these same things that are going to go into use,—when they get to that stage,—will have the interest computed in that same way and will become a part of the plant, but you can't have it as a part of working capital and capitalize it besides. That pipe in stock, if it is a reasonable amount, will presently go into the plant and the return on it will be reflected in the value of your plant. I don't agree that the amount of pipe in stock is a constant amount necessary to be carried. Whether the amount of pipe stock actually carried is included in the list of supplies or not, but if it isn't I still fail to agree that it should be included in working capital because you- pipe comes and goes spasmodically in the fore part of the

1461 year and in the latter part of the year the pipe is nearly all used up; you may have a few random lengths of pipe, but you wouldn't be laying pipe in the winter time except for repairs, and when the next year comes around you buy more pipe to lay with the loss in interest on that pipe, as I see it; while during the several months it is out of use, a fraction of a year, is taken care of by allowing capitalization of that interest loss. When the pipe once becomes a part of the plant you expect to have a fair return of its value to the plant and you are entitled to it.

I stated my reason for not valuing the property that lies outside of the plant in which your money is invested, that is, following the method I followed, you are going to capitalize the loss of interest when that property goes into the plant. Now following this method you ask me to assign what the result would have been. You would

have been having that carried all the time as working capital and getting your interest on it as working capital during all the time it was out of the plant, when you get it into the plant you would have it capitalized for an equal sum. Taking the company's records for the average amount carried in stock I refuse to put that in here as a part of the working capital for the reasons I stated. My item of 7% covers interest, taxes, engineering and supervision, and some minor incidental expenses, not fully set out here. My heading is more brief than my testimony, it is just called "Engineering, interest, etc., 7%"; that is all it says there; I explained it in my direct testimony, I can't tell exactly what it covers, it is not fully set out there. I assume that I had available the inventory of the company as to the supplies and materials in stock at the time I made up these tabulations on working capital; I didn't ask specifically for it that I remember, but everything appearing in the office to be available by searching around and getting it. The details of the materials and supplies were
1462 set out in Mr. Lea's report giving each item and the value of it. His report did contain a list of such materials as you mention, namely, the amount of oil for enricher, amount of coal, and coke and tar; purifying materials, main stock, service stock, fitting stock, appliance stock, gas stock, water gas repair stock, pipe and fixture stock, loan account stock, and miscellaneous stock; I was looking to see what I had down about these in this schedule. I don't find those items in my valuation of the physical equipment. Distinguishing between the coal, coke and repairs on hand for water gas sets to manufacture gas so far as working capital is concerned, a reasonable amount should be included. I don't agree that I haven't included that amount in my statement of working capital. I haven't prepared and set out all the items, I tried to tell you that I am not thinking that all of that is working capital or that it is going to be invested in coal, coke and oil. I gave here the value of the amount the company said it had invested in coal, coke and oil from month to month, and to that I simply add the expenses of the company during the month. I didn't add anything for repairs carried in stock for water gas machines, nor I didn't add anything item by item: minor things that you have got to have,—you have to have a little purifying material that costs a small item, but I do say, looking at these figures and with the general knowledge of the gas business I have, that I thought $20,000. which I got at approximately by taking the total expenses of one month and adding thereto the coal, coke and oil you had on hand would amply represent the amount you would need,—not only for coal, coke and oil,—but all the supplies you would need to have on hand. I am not going to say that you would have to have $20,000. invested in coal, coke and oil; I take this as a convenient way of showing you how the larger items you have got to have on hand by the actual records by way of actual reports.
1463 I did not include the items in stock you carry because I considered these principal items you necessarily carry,—that I had made a sufficient showing to indicate them. I might not agree to the propriety of the general items to be carried in stock which you show as $16334.42, or might not agree to the amount of

them. As to whether I disagree on the coke, tar and purifying materials,—Tar you are not entitled to figure as working capital in any sense, you have already paid for it, you have paid for it in the coal. It is perfectly proper to have some money invested in purifying materials and have a return on that. I tried to make it plain on that point. I haven't attempted to say that you should have $20,000 invested in coal, coke and oil and the expenses of the previous month. I merely said, that to my mind, taking the expenses of the previous month and the coal, coke and oil you had on hand at the end of the month you would get plenty for working capital. I could name a dozen things that you would have to have to run your business. I include in my total expenses per month, the expenses as set out in the company's books,—all the expenses they say they were under. It includes pipe expenses, in so far as the company reported any. It is the expense for the purchase of materials that are charged to repairs and renewals. Take for instance, the bench ite-s, a large amount of $5000 in one year, that is all included in my total expenses figured in the month, taking the expenses just as the company reported them. As to the pipe,—the records haven't disclosed to me, whether or not these monthly expenses include any amount of pipe purchased for the purpose of repairs and renewals. I knew if it was a large sum it was apportioned over a number of months, that included all they charged to repairs and renewals. They charged a substantial amount to mains as well as to other things. These ex-

penses for supplies purchased and carried in stock were car-
1464 ried as a part of the expenses for the month. The item of tar is a by-product resulting from the manufacture of gas, and is carried by the company for sale just as they do gas, and when sold is credited to the operating expenses, it is a part of the income. You can keep your books that way. While carried in stock as merchandise I would not carry it as an item of working capital. I would carry it as a part of the assets like the money in the bank the company don't need to use. Your company is not entitled to a return on it any more that it is entitled to a return on the money it got in the last month from gas consumers. It is a part of the over-turn of the working capital.

The loan account stocks, being the appliances loaned to facilitate the further sale of gas, I wouldn't allow that at all from any standpoint. If the company wants to go into the appliance business and knock out the local dealers I don't think it should be allowed to charge it to the consumers. Even for the appliances furnished free to induce the sale of gas. The business of a public service concern is to sell its product at a fair price. I wouldn't think the company justified in furnishing the burners upon gas appliances in a house; the principle is wrong, regardless of the small cost. I wouldn't think it any more justifiable than to give a gas stove away to induce the sale of gas.

Whether the amount of expenses incurred during the month for the manufacture of gas are limited to that,—I don't think those dollars of expenses taken from the reports of the company represent necessarily at all the actual outlay of money; they represent the

POOR COPY

value of things used largely due to the matter of their method of ledgering up their repairs and renewals. They wouldn't necessarily apply to a particular month. The- represent the value of the things used.

Whether I would regard the amount of the gas bills due for gas the company had manufactured and sold and was carrying
1465 until the following month, as an investment to be taken into account in the working capital,—I would say that isn't an investment of the company at all, such as the money to buy coal and labor to make gas, the amount you are going to get from your gas isn't your working capital at all. Capital is what you put in, that is what you are going to get out. Accounts in the books due and unpaid such as losses are not working capital. The ones you are going to get the next month are already charged up and I have allowed for the making of that gas, that is, the cost of the materials and labor, and whether I should add the value of the gas after it is made, I say no. When I say I have provided for the cost of manufacturing this gas I mean that I have provided for the cost of the coal, coke, oil, labor and everything else; my $20,000 allowance includes everything,—every kind of material you need to make gas. The plant itself is used and used up to deliver that gas to the consumer and that is charged into depreciation. On the difference between the labor and material cost to make the gas and the cost of the delivery to the consumer, for a portion at least, the company should have a return and that is its annual dividend. If you don't get more for the gas delivered to the consumer than the actual cost of the gas the rates are confiscatory, if as the company contends, it is not earning more than the gas actually costs it. The actual cost of the labor and material is a part of the amount your company is entitled to have from the consumer; your company is entitled to have the cost of making plus a fair return on the property used to distribute it. If the fair return is eliminated from working capital you get it in your dividend, you can't take out your dividend every day, you still have your plant and you have $20,000 to go ahead and do business with during the year and you use your gas receipts to buy more materials and send it out as gas ag-in and at the
1466 end of the year you have in the bank on hand a sum sufficient to pay you a fair return on your fixed assets. As far as my testimony concerning working capital I don't say that you would be required to sell gas at 70 cents or 80 cents a thousand; the labor and materials entering into the making of gas wouldn't amount to anything like 80 cents a thousand. I give you credit for working capital what I believe is necessary to enable you to carry on the gas business; what the consumer owes you at any particular time has nothing whatever to do with the case. I can't see it that I am requiring your company to furnish that plant for the delivery of that particular amount of gas to that consumer without compensation. I think you- compensation is returned at the end of the year on your plant assets, and what you are entitled to for working capital is enough to start in the year to reasonable carry on that business

POOR COPY

during the year. Working capital, to my mind, has no reference to the sums due for gas consumed.

As to where I get my basis of one month's expenses plus coal, coke and oil,—I simply look at that, taking it in conjunction with this exhibit "394" where it appears that the income is substantially greater than for all the expenses, for instance, November 1912, the income was $25,562 from the gas business, and the sum of your expenses on your books, plus coal, coke and oil on hand was $20,239. Simply looking at the operations for that time I say that $20,000 is enough to enable you to carry on that kind of a business, in addition to the sums you get month by month from the gas consumers.

In figuring this cost of coal, coke, and oil, and labor cost of the gas, and bills payable I also took into account the depreciation on the plant in manufacturing and distributing that gas. I took into account all other expenses necessary for the company to incur when I say that $20,000 is necessary and all that is necessary to provide a working capital, to work with. I don't figure out any
1467 specific item for depreciation for the gas manufactured and sold the previous month: from some familiarity with these account- I see that their coal, etc., is running $20,000 in those months, and that, according to my best judgment sets an ample limit on the amount of working capital for them to have for everything. I don't mean that you would spend that all for coal and oil right away.

Motion to strike the answer as not responsive overruled and exception allowed.

I don't allow anything for the use of the plant itself as a part of the working capital represented in the accounts receivable, as a return on the value of the plant no. As to including anything for depreciation on renewals and repairs, I have taken your expense items, which includes a large sum for alleged repairs and maintenance charges as necessary to take care of small repairs, and large enough to take care to a considerable extent of depreciation. I haven't apportioned the percent of the total expenses for repairs and renewals; I simply allow $20,000, on this showing of income and expenses and said that was an ample sum to put into the business to work with, and I took into account what I think was necessary for the stock supplies on hand and the amount of money the company had to keep in the bank to conduct its business. I didn't have specifically in mind any particular amount you had in the bank, but have included any money the company must have had on hand. I could, on some thought, separate that $20,000, working capital into the component parts that made it up, as in the previously stated way it would be fair and reasonable at some times to have $5000. in the bank and $15000. invested in other things, but that ratio would vary; the next week you might have to pay out $2500. of that $5000. and the week after that you might have $15000. or $20000. as your gas receipts come in, it is a fluctuating mat-
1468 ter and any separation would be purely a temporary matter and would be changed by the next month's out-go and income.

I would take into account the amount of the pay-rolls in determining the amount to set apart for working capital; I don't remember now what that is, it is all included in your expenses. I don't recall whether it is $10000. per month. The aggregate amount of business this company does is something like $285,000.

I think that the working capital of $20,000., which would include the necessary supplies for the company to carry on hand for the manufacture of gas, would be sufficient, in view of the fact that in the regular course of business you get in more every month than the regular monthly out-go. I have taken into account the money necessary to pay taxes, that is easy where you have an income of $280,000. It would be easy to do that on a working capital of $20,000. where you are turning your capital over all the time and getting in your monthly incomes from gas. It would be a different situation if you wasn't going to get your pay for your gas until the end of the year. $20,000. is not the margin between what you get in and pay out. You receive and pay our $5000. some months other $10,000. the $5,000. is too low for some months just as the $10,000. is too high for some months. I set apart $20,000. for working capital which is outside of this income and expenses; there is a difference in the month of November 1912. in the expenses and income, you received that month $25,000. and paid out $15,000.

Referring to Mr. Lea's report of working capital and whether in fixing the working capital I took into account the amount the company owed, or had secured in the form of credit or on account of its credit, I should take it into account in this way: from the credit
the company had and used less the working capital it would
1469 require. If the company purchased on credit I wouldn't give
the benefit of those credits in the form of working capital. You are not intending to give the benefit to the consumer if you carry this business on credit entirely and don't pay for anything. The company sells the gas and gets the money from the consumer and necessarily have to lay apart for materials, it can't charge the consumer for the capital. Your working capital is ordinarily expended in the purchase of supplies and labor and repairs to your plant. The amount of $40,000. which I find as the total bills payable wouldn't be taken into account as measurable by the working capital. If the company actually owed $40,000. in bills payable I would still say it could get along on $20,000. working capital; the amount the company owes bears no particular relation to the working capital, if they owe that amount for stuff used in the supply of gas it tends to reduce the amount of working capital if you are carrying it along. If it was reasonable to buy $40,000. of stuff and pay for it in cash it would require $40,000. but it isn't necessary to do anything of that kind; you can buy your supplies on reasonable credit and the consumer, when he pays a fair return, is entitled to have you use good business judgment and take advantage of the terms you can take advantage of. To say that you haven't any credit and must pay cash would that be provided in working capital, is supposing a case that doesn't exist. Under such a necessity I suppose they would; I suppose the consumer would have to pay enough

of a return on enough capital to pay for everything spot cash, but the company don't have to do that way. The public is entitled to have the company so conduct its affairs that it will have the benefit of ordinary credits, and is entitled to have the benefit of such credits for which it pays the company its expenses and a fair return on its property. I don't take into account any certain amount of
1470 money the company has on hand in the bank as affecting its working capital, not as to the amount of that at any particular time. That wouldn't be any indication to me as to the amount, in the judgment of the management of the company, was necessary to have to meet obligations when they mature, on account of the manufacture of gas; it might have a lot of bond obligations; it might be accumulating money to pay dividends or surplus and nobody knows for what purpose; the amount of money it has in the bank don't throw any particular light on the working capital; it is what you must have in the bank or somewhere else to carry on the business. Whether there had been no dividends in the past ten years and none in contemplation, the amount carried in the bank would have no crucial value affecting working capital; I should not know the character of the obligations the management thought necessary to have on hand in the bank to meet, whether for financing other gas plants or accumulating bond interest. It is not necessary to know that before passing on the question, because the manufacture of gas is something we know about; we know what materials and labor are necessary to make gas, from the company's own reports,—I know what labor and materials are necessary to make gas,—the fact the company may have a large amount in the bank, and for what purpose I don't know, but that fact don't increase its working capital. We have companies in Massachusetts that have hundreds of thousands of dollars of surplus, that don't increase their capital by what they have to use for the benefit of the public. I don't agree that it is necessary to have a large sum on hand to purchase supplies and equipment to facilitate the manufacture of gas, you must have enough to meet your current obligations. As bearing upon this item of working capital I distinguish between credits extended the company in the purchase of supplies, and credits extended on its bonds secured by its property. I said the amount of money the
1471 company owed for coal, coke and oil or anything else in the way of supplies they purchased and carried on an open account that the consumer was entitled to the benefit of that credit and it should not enter as a part of the working capital; If you got a credit say of $333,000, to buy equipment for the plant the public would still be entitled to the use of that credit until it crystalizes in the plant that is devoted to the use of the public. Whether until it gets into the plant I would pay no interest on it,—I say I have allowed the company interest on all its money that went eventually into the plant for a reasonable time, but having got to the plant I think the public is entitled to ask the company to carry on its business in the usual way, getting the usual credits, and allowing the company enough money to carry that business on with if it got the usual credits. The company gets the ordinary credit of 30 days

on its coal bill, and it don't have to pay any interest charge. On the other hand if it borrows money for its plant it has to pay an interest charge right away and therein comes in the difference I have been asked to explain. With the ordinary credits of business the company is not charged with interest. I don't know about a rule in the practice that in the purchase of supplies for cash a discount is allowed equal to the amount of interest on that amount. In some lines you buy just as cheap on time, in others you get a spot disc/ount for payment in 30 days, many times your 30 day payment is the best you can get, you can't better it. It is considered a cash price.

Asked to assume a situation where a company was capitalized for $500,000. and makes provision for a return on that investment in the plant; and a second company is capitalized for $250,000. and gives its bills payable for $250,000. more in order to make its plant a $500,000. plant, and where the owner would get any return on
the second $250,000. if he didn't carry it as a part of the
1472 working capital or carry it in as a part of the plant,—Well,
I suppose if a man put $500,000. into a plant to serve the public he would be entitled to a return on $500,000. wherever he got the money. I should not care whether he borrowed the money or his folks gave it to him. If he got the plant to serve the public he would be entitled to a fair return wherever he got the money, that would be incidental and immaterial.

That wouldn't be true as to the item of working capital; the trouble is he hasn't invested the money he actually gets; he has invested what he put in at the start taking into account that he is going to get his money back from the consumer. The company hasn't got this money in October, just because it got in $25,000. in October; that isn't a part of its investment. The investment is what it has to put in apart from the profits or sales of gas in order to run the gas business. I have heard it said the company has $40,000. in bills payable, I don't know that it is either in the plant now, or in the bank in these items of deposit as shown by working capital, Mr. Doherty may have all of it for salary for all I know. Whether in determining the question of working capital I ought to know that,—I say no, that isn't the point, I don't need to know, the company put that in and it has nothing to do with the case.

I can determine the item of working capital without determining the amount of money the company owes on bills payable. It might owe for everything in this plant, on account of bills payable. I should want to know about the accounts receivable, if you got the amounts coming from the consumers, if you could carry on the business in the ordinary way. I should want to know that.

If I were valuing Miller & Paine's store and they had outstanding bills receivable $100,000, I wouldn't regard that as a part of their investment in the business. I should take it into account, I would
look into their business and see what they had at the end
1473 of the year that they had to put in in addition to putting
in their store of stock in order to run their store. That $100,000. would not necessarily represent working capital in their business at all, the man who says that don't know what working

capital is. I regard that credit extended in a business fixes the capital requirements of that business. If I thought it necessary for the company to have $40,000. in the bank to take care of its business, and $20,000. in supplies to take care of the plant and distribution of its gas I would take that into consideration in determining the amount of working capital, but I don't think they are necessary. If the company actually did that in practice it would be some evidence they were using their judgment about that, but probably the business they were taking care of is something besides the gas business,—gas appliances and other businesses,—I don't understand all the lines of business the company has but I have become convinced from the affairs of the company that they are not confined to making and selling gas. I have discovered that they furnish electric current. Outside of that I haven't followed that line of investigation very far, but I do remember of seeing some letters and telegrams where the company was considerably interested in building a plant at Fremont. It might have been for the purpose of generating electric current. Whether any of those items were finally carried to this company I don't know; I am dealing with the gas business and the money necessary to have invested in the plant in materials to make gas and the labor, but I haven't run down or investigated these other lines of business the company is interested in. I don't know what is necessary to carry that on. I say the company is extensively engaged in the appliance business, I don't know how much it amounts to in dollars but it must cost a good deal. I criticise the entering into the expense of making and selling gas the selling of things, the price of which is not subject to public regulation. By that I mean gas appliances. If you can
1474 do it with gas appliances, I don't see why you can't do it with a lot of other things and charge the loss up to the gas business and charge it up to the consumer. I am sure losses are entered in the sale of gas appliances in the business of this company, it so appears from its records. I wouldn't testify as to that as to each of the years. Taking into account the very extraordinary and extensive amount the company charged into its operating account I do say the net result has been a loss as far as the appliances themselves are concerned, it may not so appear on the face of its books. By that I mean the large percentage paid. Your company writes it down in some of its reports as a loss. The books show on their face a loss, I can't tell over what period it is spread. I say the expense is very extensive, there is a great out-go for expenses. I refer to the general expense record for one thing, specific entries for another thing; in both the monthly reports and the reports at the end of the year, but not necessarily for each year. I can't state now what years without looking it up, I have looked it up otherwise I couldn't testify about it, I haven't necessarily looked it up for all the years, I don't remember what all the entries amounted to for all the years.

Whether I regard the appliances purchased by the company for demonstrating the benefits of the use of gas as an investment it should not make,—I can only answer in this way, if there is some moderate expense that the company wanted to set up a sample of in this room to demonstrate the operation of, I should think that

might be well enough,—such as a new form of water heater,—showing how nicely you could heat water; if it means by demonstrating appliances by putting large numbers out over town at a nominal or no expense, except to the company, I should say that ought not to go in as a charge against the gas consumer.

Whether the sale of these appliances has promoted or tended to promote the sale of gas,—that, of course, is a matter of judg-
1475 ment; my judgment, is that the handling of appliances, to a moderate extend, do tend to promote the sale of gas. But to that extent would not necessarily result in a benefit to all the consumers. I doubt very much if it pays the consumer to promote the sale of gas to his neighbor at his own expense, I think the share of the consumer in that advantage is so small he had better have taken the gas at a fair price and let the neighbor look out for himself. I am acquainted with the practice of gas companies in this matter, and there is a great deal of variation, some handle very few appliances, some a good many. A large number handle gas appliances to a greater or less extent.

In determining the amount of working capital the amount the company owes and the amount owing by the company I do not take that into account. I don't consider that a proper element to be considered.

For the purpose of reaching the company's total valuation I valued the real estate, the improvements on real estate, works equipment, machinery and appliances at the plant, the investment in the distribution system and covered all those items of value of the company's property, except that I did not value the portion of the company's tangible property outside the limits of Lincoln; nor did I value the East Lincoln holder, which as I understand was designed for service beyond the proper city limits rather than for service in the city limits.

To be perfectly clear the $2625. for the real estate is the value I have fixed for the land, and that sum does not include any of the buildings; that is, only the land used and useful in supplying the city of Lincoln with gas. It may be that the company's valuation for the same item is $21,700. I don't remember, I haven't a copy of your witness' testimony. In reaching my valuation of the real estate, I was not influenced by the testimony of Mr. Reed, who values the real estate for the Railway Commission of this State. I didn't have in mind what his testimony was at all. Had I known Mr.
1476 Reed's valuation and his connection with the Railway Commission and his duties there his valuation wouldn't have influenced me. If I had nothing else to go on undoubtedly it would have an influence, it wouldn't have over-ridden my own opinion derived from evidence of actual sales, if I thought the sales were enough to give a fair basis for an opinion. I don't claim that I have qualified myself and am competent generally over the city to testify as to the value of real estate, but of the real estate of the company particularly I do, that is my view. In qualifying myself for that service my sources of information were derived from observation of the district in that part of the city; from a number of sales

which were collected and arranged at, and according to my request, sales in the vicinity of the land. That is, I mean the valuation that was the consideration named in certain deeds. I took the consideration as that stated on the face of the deeds, if I saw a nominal consideration of $1. I didn't consider that at all. In that case I dropped it, I couldn't get any information out of that, and that restricted me to a few sales. I haven't got my tabulation, I got tired of carrying it around and didn't bring it. I didn't enquire of the people who owned the property conveyed what the real consideration was, I simply went on the face of the deed, and on my judgment. I talked that matter over with the attorneys as to whether the consideration on the face of the deed was probably the real bona fide consideration, and made up my mind whether it was or not, if I thought it was I relied on it. I talked it over with the Attorneys for the City, I didn't talk it over with Mr. Strode. I haven't with me the list of those transfers, I can bring it in the morning. I couldn't tell at all how many of those transfers there were. I can't at-empt to tell where they are located with respect to this property without my plat before me.

Whether they were isolated lots, or a number of lots together or
1477 a block of ground together,—my recollection is there were a number of sales of separate lots, 1 or 2 or 3 in various blocks. I looked the thing over with some care to ascertain whether they were improved or not,—they were largely unimproved,—there may have been one or two improved lots in the bunch, I wouldn't say. I don't think I enquired what the Beatrice Creamery People paid for the block of ground acquired by them recently. I didn't learn in any way on which I could rely as to the price that that was for the transfer of half a block of ground upon which they constructed a large building. I have before mentioned that they got some land and I saw a building down there. Whether a very large building, I say it is a building. It is a short distance from this block upon which this plant is located, I should have to have the plat to tell how far it is. Something over a block I should say, possible as much as two, I doubt that, somewhere in there. I never got any information what those lots were sold to the Beatrice Creamery for. I heard a statement here in court but I don't know when they got it; the record of sales furnished me at my request didn't disclose, as I remember, anything about that sale, I naturally inferred the information wasn't available. I don't remember the consideration in the deed, whether nominal or not, I don't remember that I got any information about that sale, I may have got some. Mr. Foster furnished me the record of transfers of property down in that vacin-ty. My instructions were that I wanted every transfer that showed any substantial consideration, I didn't care about the $1. transfers. Whether there were more $1. transfers furnished me than anything else I can't say, the number of them didn't influence me any. They were worthless as far as the value or anything else was concerned. Whether I got all

the transfers of property that took place down there in the
1478 vacinity of this land,—I don't know that I have any hard and fast statement, that is what I asked for and wanted to get. I was furnished what is embodied in this tabulation which I have

presented to the court. I included all I got; that transfer for that land may be there, I don't know whether it is or not, it has been months since I testified about that. Those sales and my official observation was all the sources of information I had for becoming acquainted with the value of that land down there. I looked at the land and saw how it was situated with respect to other property. I don't remember how far back these real estate transfers run; I think they came down to a very close date, within a few months. I think those transfers were within one or two and some less than a block of this block of ground. There might have been some further away. I am asked to get down to figures where I can't give them. Of course, when I got this copy of the records as to the consideration for these transfers I considered the date when the transfer took place, and the location of the property with respect to this particular property. I had my mind precisely on that condition, I couldn't form an idea about the value of the sales unless I knew about the date. If these deeds didn't recite the full consideration I would be misled in my conclusion. I examined the property involved in those transfers to this extent,—I examined the blocks where the lots indicated in the transfers were located, I didn't examine it to the extent of tracing out the stakes. I went into the neighborhood to see whether the lots were in Salt Creek or above it,—well as to Salt Creek, I wouldn't testify definitely about that, I haven't taken any levels; I looked the land over. Whether I enquired of men, or think it desirable to enquire of men engaged in buying and selling real estate to inform myself of the value of such property,—if I had unlimited time at my disposal I should not reject such sources of information, but I thought these were better. I didn't enquire of those men, nor of any

1479 , men in the real estate business in Lincoln, not one, except what I heard in these hearings, I think I heard one or two tell something here about the value of those lots; I didn't ask them about it before they came, and don't remember now just what they said. I made no enquiry what anybody would pay for that block of ground, or whether there was a demand for *for* such a block of ground. I went down there and looked the thing over and got my information that way and partly from the deeds; those were my two sources of information. My recollection is that I did not get a record of the transfer to this company of this particular property. As to whether I learned from any source what this particular block of ground cost this company,—I learned partially, something on that line from the company's records, namely, that it was traded for another block of ground where the plant was formerly located; how much was given to boot or how much it got I don't know, but I know that much from its records. Whether I know more from the records or from the testimony offered here,—from the company's records as I remember it, I wouldn't be positive about that, I think I got that from their records as well as from the United States Report, I should have to confirm my recollection. If I got it from the company's records I have a copy of it down at my room. Possibly it was testified to by Mr. Adams, I am not sure of the source I got it from. Whether the property transferred in the vacinity of the plant had

any trackage, facilities,—I think some of it was so situated that trackage facilities could be provided for it. I don't recall at the time I looked at it whether any piece of property I saw the purchase price of on the deed, had a spur track on it at the time I saw the land. I took into consideration that this block of ground had a spur track upon it. I considered that added some little to the value of the land, but I didn't figure it as a separate element. I couldn't state the amount because I never separated it that way. I think it may
1480 be fairly assumed that it didn't depreciate it. I took into account that this block of ground was located in one body.

Assuming that a block of ground has 12 lots on it, whether I assumed that one lot sold in that vacinity would represent one-twelfth of this block,—I would say not necessarily, if I had I would have valued the company's land at less than I did. I added to the company's block of ground over what I allowed for some of these lots; I allowed the company more per unit of area than some of the sales indicated, because of the whole situation that entered into it; I am not assenting at all that an acre of ground is worth more necessarily per square foot than the ordinary size of building lot, just the reverse of that might be true. Assuming you needed a block of ground together, whether you would have to pay more to get the block together than you would for the same proposition per square foot per single lot,—I would say it might be, but I don't think it would be down there where the plant is. My impression is there is an available block of ground in that vacinity that could be acquired at a reasonable cost to this company, I haven't an accurate description now that I could give without reference to the plats, I haven't been over the situation for months. My impression, I regret to say for the benefit of the people who own the land, is that they are not improved lots, most of them. I can't designate any vacant lots without getting a plat if an accurate discussion of it is desired. I don't know of anything to indicate such conclusion that to buy a single lot would cost more than I have allowed the company for the whole block of ground. I allowed the company more for the whole block more than some of these sales indicate for just a single lot. I am talking about the sales I actually saw and consider them in this neighborhood, or near enough to bear on the value.

Whether I determine on the 2½ cents per square foot as
1481 the value of this real estate, I wouldn't even dare to testify whether I determined that from these sales I have mentioned or from other investigations I made outside, without looking up my records. I may have said that taking cities somewhere near this size, that 2½ cents per square foot is more than has been paid in recent years for land occupied by gas plants. The answer previously given by me being read,—I testified to that, I know about 2½ cents generally is the price. Whether I also testified "It is not at all uncommon to find such land bought for $1. an acre or leased", —Whatever price I fixed on the value of the company's land the value was governed primarily by what I was *led* to believe by the investigation I made, the land was worth in that particular vacinity; land often being gotten in other cities somewhere around $1. for

gas purposes; it might be in this city you can do that, I have that in mind. It is some guide if you don't have anything else as to the probable cost of land suitable for gas works. I had that in mind when I started to value this plant, for years I have been seeing it demonstrated. 2½ cents a square foot is about $1000. an acre, almost exactly, it isn't precisely. As to the source of the information that caused me to think 2½ cents was about right for the real estate,—I really took into account what I got on the face of these transfers. My recollection is that some of the transfers were a little above 2½ cents a square foot. I never had the opinion generally that 2½ cents, from my investigation of gas companies, was about the right figure for land for a plant. In a good many locations, in small moderate sized places my opinion was that 2½ cents per square foot is about what companies would pay for land for a plant. I looked at a good bit of land in Haverhill and every city of that size helps to confirm the general opinion I have arrived at from a general study of particulars, in Haverhill I looked at a good deal of land, and for cities of that size 2½ cents would not be an
1482 extraordinary figure at all for a good sized plant. I think in Haverhill the company would be justified in having 2½ cents per square foot invested in land for a plant, it might be justified in having more, it would depend on the land it had. Whether that 2½ cents applies generally to cities the size of Haverhill in Massachusetts, or $1000. an acre for land for plant purposes is about what the companies carry,—That isn't it at all; I haven't said anything about what you can get in many places the size of Haverhill, or this City,—I said good gas land at about $1000. an acre; I didn't say that the land upon which the Haverhill plant sets is worth that even for gas purposes, although it is worth less for gas purposes than for some other purposes, but I am telling you what you could go to Haverhill and buy a strip of land that would do for gas purposes, what you could get such land for in many places about that size and smaller, namely, $1000. an acre. To some extent I testified in the Haverhill case about this same proposition. My attention being called to certain testimony I gave in the Haverhill case as to my method of determining the value of land for plant purposes, and asked whether I recall that there I based my opinion on what I had learned of what companies in Massachusetts had invested in real estate for their plant purposes and stated to be in the neighborhood of 15 cents a square foot,—I will state I recall the first part to so testifying, but I disagree entirely with the conclusion drawn in the latter part to the effect that I testified that real estate there for plant purposes was in the neighborhood of 15 cents per square foot. I say that only a fragment of my testimony there has been read about the method of arriving at the value of the land in the Haverhill case. What was read may be about what I said in the Haverhill case, but the extract doesn't fully represent the
1483 purport of my testimony in the Haverhill case at all. I did testify in substance about as it reads there, but I also testified much more than that about my method of arriving at the value of the land in Haverhill, as a matter of fact I did not at all finally

fix on the price I applied to the Haverhill land by reason of the investigation I made over the Commonwealth some years previous that did lead me to a conclusion that the 15 cents was about the maximum price for land in any such place, and I was more directly controlled, as to my Haverhill figures by what I found in the city of Haverhill, just as I was here.

Whether I further testified in the Haverhill case when asked for my reasons for my judgment that 15 cents a foot was the proper price for that land, was as follows: "The value that I found for that real estate was simply its value for gas making purposes, not at all its market value with the gas buildings removed", as I recall I found that to be 15 cents a square foot,—I will say that I think that was the figure I arrived at, I am not positive, I haven't a copy of the Haverhill testimony here.

Whether when asked to state my reasons in the Haverhill case for the valuation of 15 cents per square foot if I did not testify as read from the testimony in the Haverhill case,—I say I might have said it. And further whether I did not say in that Haverhill case that I had given considerable time to this matter, and 15 cents a square foot was about the price for real estate for plant purposes in the Commonwealth of Massachusetts,—I will say it didn't go to that extent, and furthermore I testified a great deal further and gave a great deal more of it about my basis for the 15 cents which is not now chosen to be read from that record at all. All my basis for the Haverhill land has not been read. Whether there is any reason why it should be 15 cents in Massachusetts and but 2½ cents
1484 out here.

Objection as assuming something not in the testimony. Overruled. To which the defendant excepted.

(Witness continuing:) I haven't testified that it is 15 cents in Massachusetts.

Whether there is any difference here when I base my valuation on my knowledge and experience on what plants in other parts of the country have invested in real estate for plant purposes and bring that information here to apply to this situation whether that valuation should not be the same here as it was at the source I allow I got my information,—in the first place I first said I got no such information, as a matter of fact I didn't, the value of land for gas plant purposes in Massachusetts in a great many places, is very much less than 15 cents as I already testified. The value of land allowe- in Haverhill, if the question includes that, was there based to only a very moderate extent on my former investigations in other places, and to a very large extent on what I found to be the selling price in Haverhill, and this was a more determining factor than any of the others singly. Of the value, in those of the Haverhill gas land on which that plant sets, which is perhaps as great as $1.50 per square foot as to how I determined it would be $1.50, I heard the testimony of the company and consulted with various persons about the value and looked up some records of transactions and I found it was a pretty valuable piece of land, setting right in a

thickly built up district that the plant was on, it was a small piece of land,—much too small for a plant of that size to be on I concluded,—taking into account that there wasn't a great many square feet to be dealt with anyway, that the location of the plant in that point saved something in the way of lead mains to get the gas on to the town, and some other factors, I concluded to allow them as much as 15 cents per square foot as of value, although as it
1485 appears from my testimony in that case, I found lands, which I testified were equally as good or better for gas plant purposes which could be had at a small fraction of 15 cents right there in Haverhill too. I said that particular piece of ground in Haverhill was a small piece of ground that I considered worth from $1.00 to $1.50 as a piece of ground, it was worth that for gas plant purposes.

As to how I distinguish what it is worth as a piece of ground and what it is worth for gas plant purposes,—I distinguish it in this way, the sum of the parts can't be greater than the whole. If the gas plant has a value, a suitable piece of land plus the cost of erecting that plant on that land, but you can't take the cost of the buildings and machinery at their cost and add them to the cost of an unsuitable piece of land,—unsuitable because extremely high,—in brief that is the way I understand the decision of the Massachusetts Courts and that is the way I went at the thing. There are two values to this land one its actual value which in Haverhill cost from $1.00 to $1.50 per square foot; and the other is the value for gas making purposes. The land has one value for any purpose and another for gas making purposes, even less for farming and raising potatoes if you limit it to that.

In this valuation of the real estate here I have not given the value of this property for any other purpose than for gas making purposes, what I believe to be its highest value for any purpose. I think the company has a piece of land suitable for a gas plant, I think it is worth as much for a gas plant as any purpose I can think of. Set where this building is I should not think it would be entitled to the value of the land here added to its gas buildings. Whether I know of any reason why the company is not entitled to a fair valuation of that block of ground, what it could be sold for on the market in this land making gas just as it is now, or with the buildings off, or for any other purpose, that it could be sold
1486 for as a block of ground,—whether there is any theory that I have as an engineer that would deprive the company of a dollar's value in that block,—I would say no because I have said I think it is just as valuable for gas making purposes as any purpose I don't think that this company is in the Haverhill situation at all, with an extremely valuable piece of land. This company has a piece of land that isn't worth any more than for building a gas plant. Assuming the Beatrice Creamery people paid $10,000 for half a block and the company's block just as good and a whole block wasn't worth any more than $2250.00 and situated not more than half a block from the other,—I say their land is better located than the company's a lot better, still if they paid $10,000.00 for it and didn't get awfully cheated it would probably operate to raise

the land in my estimation. If I was convince- of that fact I should want to compare it with other sale- I found there. I don't know whether I could buy a whole block in one piece down there for just $2250.00, because I don't know but what some improvements would have to be destroyed to get a complete block. If you had to destroy the improvements to get it but rather it might add something to it. I still think that my valuation of $2250.00 is a fair valuation. If I did not think I was giving the company all they were entitled to in the value of that real estate I would double or triple it; that is what people are selling for. I didn't go to any real estate man to learn its value. I considered the Register of Deeds office a better source of information than to see so and so the real estate man, it is worthy of consideration for its weight and I thought the consideration recited in the deeds more weighty.

If there is anything I have said is to be construed as an admission that the price of a whole block of ground is the criterion, I wish to correct that; I didn't mean to give any such impression and I deny any such statement. I understand that a block of
1487 ground is a fair amount for the company and I think it has a block.

I don't know and I didn't try to find out how much the Burlington Railroad paid for a number of lots immediately adjoining this block on the east. I don't know anything particular about the transfer of the lots. I want to deny any impression at which a whole block of ground must be acquired for is any criterion of a fair value of land in that vicinity. I didn't intend to give any such impression, I haven't any such idea in my head, it is just the reverse. It might be some fellow wouldn't take a fortune for his land because his great grandfather was born there and he is attached to it.

I eliminated from my valuation one half of the land that the company owns in block 77. That is the block diagonally across the street where there is a small house occupied by a dwelling. I ignored it because I found the company was not using that but was using some other land suitable and I didn't think it was properly located to be used in connection with the gas plant. I didn't know what arrang-ment the company had made before it got to use the other land or that it got this other land in consideration for this block 77; I saw the company using the other land and I concluded it thought the other land was good to use and block 77 wasn't. The company seemed to be spreading out and I judge in time it will require more than one block, if it gets the spur track run into the next block that is about the right way to run it. I took into account the fact that M street had been vacated and one half of that street has reverted to the company on account of the ownership of block 79 I raised the amount of my valuation from $2250.00 to $2600.00 on account of the vacation of that street being on the basis of 2½ cents per square foot, I concluded the company's land should be valued at that.

1488 The ground in connection with the East Lincoln holder consists of lots 1 to 15 in block 2 and lots 1 to 15 in block 7

Pecks Grove Addition. I didn't value that at all, I didn't consider that it would be used or useful in connection with the gas business here. I left the lots just where the company left them and didn't value that real estate at the East Lincoln holder at all for any purpose. I excluded the real estate, the mains and the whole thing. I understand it is within the corporate limits of the city. I know that property is occupied by the East Lincoln holder and a booster house in connection with it, as far as the service is concerned the holder being out there and in connection with the company's system of mains, there is a sense in which it may be said to serve some territory out there in some degree, but I don't think it is necessary to use there for any service in the City of Lincoln. I don't think it good policy to have it there for that purpose or that the company would ever have put it there for service in the city, I don't think that was the reason the company put it there, I think it put it there to serve University Place and Havelock which the company began to serve extensively and to run its mains since it put that holder out there. Whether that holder was completed and in service before any gas was furnished either to Havelock or University Place I should have to refer to the record for that.

The fact that the holder was completed there and in service before any gas was furnished to Havelock or University Place I should take that into consideration in conjunction with all the other facts.—if I did show in my exhibit when the gas began to be furnished out there and when the company began to run its mains into these outlying districts. I know that before that holder was constructed the city complained of the service in Northeast Lincoln. I learned that there was a complaint about the service there and elsewhere in
1489 Lincoln. But that the company couldn't get gas out there under sufficient pressure to take care of Northeast Lincoln I don't assent to at all. I learned that the complaint was that the gas was not delivered with sufficient pressure there and elsewhere in the city, but as to the means the company had to increase the pressure out there I would say they have the same way open to them that would have been to supply all the rest and deliver where the demand was greater per acre and at the same price, namely, to raise the pressure and put on service governors as they done about the time and after the holder was built. The company did increase their main capacity to supply that portion of the city. I haven't made a sufficient analysis of the system that I would like to testify to it; if they did have to increase the main capacity so much the less reason for building the holder. It is a fact they built a larger main. I allowed for every foot of mains the company says it has got in the city; I consider that a part or portion of that main was constructed to serve Havelock and University Place and I allow the reasonable value of that larger main, but I refuse to allow for any holder because I thought the holder entirely unnecessary for the service of the city of Lincoln, that was my reason for excluding the holder. My recollection of the cost of service governors of the small size, such as the company commonly uses, cost about $1.50 as a matter of first cost, but there is an addition to that. I don't remember what I as-

signed as a reasonable addition for installation, the value of the service governors should go in and if I didn't put it in I am willing to do so.

Whether according to Mr. Lea's report 7170 of those service governors at a valuation of $19,107.00 and whether I would think that was an expenditure the company should have made to take care of the situation in Northeast Lincoln rather than to build the East Lincoln holder,—I would say the company appears to have
1490 made both, of course I don't agree to those values or agree to any such a value for service governors. I think the company should have expended enough in mains to supply that part of the city or else use the service governors. I have valued them, if I haven't I am willing to, but the service governors would take care of the other portions of the city and take care of East Lincoln just as well exactly. I don't remember the mains the company had in Northeast Lincoln and it is apparent to deliver that gas through those mains prior to installing the East Lincoln holder, I know that now they are fully as heavy possibly the mains running there before the holder was built are not the mains running there now, but they could have left off the holder and built the mains. I don't think I saw the engineer's report advising the construction of this holder when I was examining the company's records; I saw the report advising the raising of the pressure by the use of service governors. I don't think I saw any report advising the construction of the holder out there. I would like to have it shown to me. I recall that there was a record introduced in evidence by Mr. Adams dated some year or so before the holder was constructed and I think that advised the company to take some steps to relieve the situation in Northeast Lincoln and elsewhere.

Whether I think that the company was justified in building a district holder in any event in a city the size of Lincoln,—well, there might possibly be some circumstances that would justify it or some situation, coming down to the particular facts in hand I don't think the company was justified in building the East Lincoln holder for the City of Lincoln any more than it would be justified in building it on the other side of the city where the demand was just as great. I haven't noticed, seen, or had called to my attention any location where I think they would be justified in building a holder distant from the works. The matter whether the company
1491 should build a holder or just what they should do to relieve the situation in Northeast Lincoln is an engineering matter. Whether in the exercising of and passing judgment, even though it might not agree with mine, would I feel justified in eliminating any value for the property installed on account of following out the engineer's recommendations,—if I thought it was a mere difference in opinion or judgment in trying to arrive at the same end, I should hesitate a good while before say- that the property should not be included; but I don't think that at all. I don't think the company's engineer located that holder there for the primary purpose of serving this city but other cities. I have a whole lot of matter and all of it taken from the company's records which I introduced in con-

nection with my direct testimony, upon which to base that opinion, and I don't doubt but that will be stated again and tabulated before we are through. I don't happen to have the testimony here the exhibit which showed the company's service in other municipalities and data which dealt directly with that transaction here now. The chart introduced by me to show that more people were living in other wards wasn't the principle thing introduced, but that was one element, I paid attention to the ward line, in dealing with the location of the gas holder to serve Northeast Lincoln, but paid more attention to the population, or the vacation of the population in that part of the city. I also paid attention to the fact of the company's long main running out to that other municipality immediately after that holder was available to render service to them, and of the increased gas sales in those various municipalities as soon as the company had the holder to get the gas out there to them. Whether that would be a reasonable service for the company and a good investment in order to serve Northeast Lincoln if they could also use that
1492 investment to extend the sale of their gas outside the city I haven't considered whether, taking the company's whole business and all the business it expects to get in the next few years, I haven't gone into that question, I am not considering other business of the company because they have business outside of the city. I won't say that I want to charge that holder and that real estate up to Havelock and University Place, I don't want to charge it to Lincoln because I don't think that is the purpose of it.

With reference to this real estate, I don't now recall whether I consulted particularly the testimony of the witnesses offered on behalf of the city as to the value of this real estate in the printed record. I don't recall at the time I undertook to fix a value that the city upon the former hearing valued and offered testimony to the effect that the land in block 79 was worth $9,000.00. I did not consult the tax commissioner *fo* the city with respect to the value of the property, in block 79. I don't remember th-t the city had a tax commissioner whose duty it was to value the real estate in this city. It is pretty hard to say what I would have done with something that didn't happen, whether I would have accepted the valuation of the city tax commissioner of this real estate without knowing in advance what it was going to be, I don't think I should have been inclined to accept the unsupported say so of anybody. I would rather rely on the record, considerations in the transfers. It is true that the property is often taxed at a figure different from its market value for different reasons. Whether I would value the real estate or land for the purpose of rate making in block 79 at a lower valuation than the city would value it for taxation and feel justified in such valuation,—I would say the value the city put on the land for taxation purposes wouldn't have anything to do with the value I should have, if I were valuing it for the purpose of a rate case, or for the purpose of sale. I think the property has only one
1493 value, but as to what some city official mi*ht*t put on or what the taxes might be that were exacted from the owner, is immaterial. It might be of some help if I knew in particular on

what basis he based it on. I have been in cities where the practise was to tax it for just about what it would sell for, when I became convinced of that fact and believe that the assessor knew what it would sell for I should consider that factor. In the Haverhill case, to a certain extent I depended on the taxation to justify my figures. I didn't even inquire about that here, I chose to go to the records. In Haverhill I knew the gentleman who acted as assessor and was acquainted with him and thought I understood his practice, I thought it corresponded with the selling price which I believed would be the criterion of value; that is the only reason because I thought his tax values represented fairly the selling price of the property,—it isn't the tax values, it is the selling values that have a bearing.

I can't distinguish between one with a property for gas making purposes and one with a property for purposes generally, I didn't in the company's case, I do in general. I say that a property, land, may have an entirely different value for gas making purposes or for farming purposes from its market value as land only; and you can have for it as high a value for use as an office building that you can not have for use as a gas plant any more than you can have for farming purposes, to my mind the cases are very clear on that point.

Whether the property only had one value whether for taxation or for other purposes,—I say it only has one value when the use is restricted, it only has one value the moment you put restrictions on its use and say it can only be used for gas purposes, or some other purpose, you may cut down the market value. If the company
1494 had to go out and acquire the property the seller would not reduce the price because of the purpose you were going to buy it for,—no well advised person would buy property for a gas plant for $1.00 per foot when he could get good property for a plant for 5 cents a foot. I am not saying that this property is any more valuable for different purposes than for gas purposes. I don't think it is, and I haven't put in the price any less. I think the market value as in the Haverhill case I allowed 15 cents which is the outside figure to be allowed for that land for gas purposes, although I think its value for general purposes,—its value in the market for gas plants,—is as high as $1.50 a foot. I think if the gas company was to seek to acquire that property from anybody else they would have to pay $1.50 per foot. It was worth the full market value as unrestricted, but you can't have the full value if the buildings are for gas purposes, as an office building you can, the two things are inconsistent.

Whether if I here that land could be sold by the company on the market for $1.50 a foot; and for rate making purposes why did I value it at 15 cents in the Haverhill case,—I would say just the land alone, yes, but I valued that land and the buildings for all I thought it could be sold for, the two together, I think that would be a fair valuation providing the sale by the company at $1.50 per foot didn't involve any compensation for the buildings, and I think that is supported in the Troy Manufacturing Company's case in

Massachusetts and in the Drummond Suffolk vs. Lowell I think that is what the court decided in those cases. You can't have the parts added together greater than the whole thing; the whole thing is the land with the buildings thereon that you are valuing. I didn't value the buildings on this real estate on the basis that they were worth just what they would be worth for gas making purposes and not other purposes; I valued the buildings on the basis of
1495 their cost of construction less depreciation, assuming that they were worth all they would cost less depreciation for gas making purposes, consequently they were worth just as much for gas making purposes as any purpose, I haven't any doubt but they were. I valued them not at what they cost but what I estimated their cost. I didn't take the actual cost as a basis and fix the depreciation from that, I used the estimated cost less depreciation.

With respect to the item of buildings I found a net construction cost on my exhibit "231" of my valuation for 1913 of $28,135.00, those figures include the booster house which I later threw out so $27,617.00 is the net construction cost of the buildings excluding the booster house and as compared to that the net construction cost of the company was $35,614.00 but the booster house should not be compared with anybody else's figures that do not include that. I included the booster house with a net construction cost of $518.00 in my $28,135.00. That is the booster house out at East Lincoln whether I threw out all of that equipment at East Lincoln the holder, buildings and all,—I say I left it just where it is, I didn't think it at all necessary used or useful in the conduct of the gas business.

In valuing these buildings, for the purpose of my computations I accepted the quantities of material shown to be in those buildings by Mr. Lea's report; I don't mean to say that I certified that they are there, I check them up to know that they are there, and I am not contending against their being there. I made no independent investigation myself as to the character of the materials represented in Mr. Lea's report to be in those buildings, as to the quantities I looked the buildings over with some care; I might not agree with every statement as to quality of material, I don't remember that I said very much about that; I should not want to say that I agreed
1496 with everything Mr. Lea said about the quality, but for the purpose of my valuation I have assumed the quantities stated and have based my valuation on those. Whether I had the exact dimensions of the buildings as given in Mr. Lea's report,—I simply assumed the quantities; I don't think I dealt with the matter further than to take them and assume them for the computation I made. On the four items of brick, concrete, excavation and stone I took a lower unit price than Mr. Lea; on all other items entering into the construction of the buildings outside of the four items mentioned I assumed to exist not only the quantities as reported by the company but the unit cost. It is not so with respect to the excavation that I assumed a flat price per cubic yard for excavation throughout the buildings, holders and trenches for gas mains, one unit price of 40 cents per cubic yard. I stated the unit cost in all buildings at the plant at 40 cents a yard. I did not state the excavation for the

holder at 40 cents a cubic yard. In those masonery tank holders down at the plant,—as to wherein I increased or decreased it in this record so far as the actual compu-ation of quantities for excavation I valued them,—by considering what one of another type would cost without such quantity of excavation. I didn't apply any unit price for the excavation in connection with the masonery tank holders; I valued them all at so much per thousand feet from my knowledge and the records of what holders of similar capacity cost elsewhere. I didn't leave the matter of excavation out so far as my consideration of the holder was concerned, but I left the matter of the quantity of excavation in those holders out of account insofar as to fail to apply any unit price, and those holders are worth what a modern type would cost less depreciation. As to whether I valued the excavation for buildings and trenches for gas mains and services at the one uniform price of 40 cents per cubic yard,—it is pretty
1497 near that for gas trenches it amounts technically to 40½ cents on the trenches. I don't think it cost much more to dig a hole for the buildings then on the street. I have had some experience in laying water or gas pipe in the town of Middleboro, Massachusetts, where I helped lay some for the city at one time; it was water pipe but it wasn't used for water pipe, it was for electric conduits; that was along in the late nineties '98 or '99. It wasn't a great deal, I don't believe half a mile. If I kept the cost of sinking the trenches there on that work I haven't them now and haven't had them for consideration on this job. I have taken into account my experience in laying that pipe here for the cost of digging these trenches only in the most general way; I have had a great deal of other experience. I had charge of that work. I had complete control of it. Those trenches were sunk by day labor, I am not able to testify now how much the cost per cubic yard was, and couldn't tell how it compared with these costs here. As to taking into account the dirt to be removed from the trenches in any particular time of the year,—I considered it would be removed when the ground wasn't particularly frozen there might be a scum of an inch or two in October or November I assume substantially no frost in the ground.

I have had the kind of experience I indicated yesterday in the construction of buildings where an excavation was necessary for a foundation or basement. I am going to testify right along that I have had experience. I have not had the responsibility of carrying on the work but I had a responsibility to my client of finding out the cost of the work, not a responsibility to the owner of the buildings. I have not had actual experience on the job of putting up a building. I never helped actually to put up a building; but I have had actual experience in a great many cases.

Whether there is any difference in the cost of removing dirt for trenches in Massachusetts from the cost here,—in some places
1498 in Massachusetts yes, other places no; there is a different rate in Massachusetts and we do differently there. Before you form any accurate idea you must know the local conditions, the kind of soil to be moved, and the conditions under which it is to be moved. As to whether it would cost any more to remove it out of an

18 inch trench than to remove it from a basement for a building, I should think the removal from the basement would be apt to be less, I give the benefit of the doubt to the company and have allowed it more down there, 40 cents is big. As to how much more it would be I haven't fixed on that but I am sure it is more, I haven't estimated how much more it is. It is a little easier to allow a figure that you know is above the actual cost of such work than to estimate the actual cost, if you want to get the precise cost it involves more careful figuring and some practical experience. I have had a good bit of practical experience.

Before I made the estimate of the cost of removing dirt from the basement for foundations of buildings I investigated the cost of removing the dirt for those State Farm buildings out there I think I have the contract and bill for that here, that wasn't the extent of my investigations, I have been investigating that for many years, I don't remember that I have any other figures in Lincoln for the removal of earth for foundations in Lincoln, but the other class of excavation I have my opinion that it is so near to that. I had information on the buildings as to the cost of digging the earth which gives information as to the cost to build a building that I got from your records and the city. I did not get from your records the cost of digging the dirt from the company's buildings but I had information as to the cost of digging earth here in Lincoln from various sources, city records and other sources; I got it from the city records and from the State Fair Grounds and my testimony that I based it on the cost of excavating the two concrete
1499 reservoirs that was only in part. I produced more than the cost of the excavation than the contract for water pipe at Dewitt. I don't remember whether I produced any figures that I got from the City Hall, I think I had the figures from the water department when I testified before, whether I disclosed that fact my testimony will show, I don't remember. That cost was far below the cost I put on the sinking of these trenches; the reason I didn't use it was because I hadn't finished my annalysis of the figures and I didn't care to go extensively into them until I had finished my annalysis of those figures. I am ready now to go into it; furthermore I knew about the cost the Lincoln company has paid for trenches in earlier years, I didn't disclose that, but I will before I get through. The company's records are a matter of record. As to just what experience here in Lincoln or information I based my estimate for 40 cents per cubic yard for excavation,—I say on the reservoir contracts which I considered and on the street grading contracts, I don't think I sited them, and on the excavations of the water department on digging trenches for water pipe, and on one or two contracts which I should have to look up, outside of the City of Lincoln for digging trenches for water pipe; also on some early records of the company's as to the cost paid for trenches, I didn't go very hard on them because the records were so far back; and I had the Meeker & Dobson contract for digging for water pipe in the village of Dewitt; the other contract I give I didn't sufficiently annalize so I didn't present it, I had one where a lot of water works

construction was involved. I didn't investigate to determine what it cost the Telephone Company to make excavations for conduits before I testified, I relied considerably on labor costs in recent years of the Lincoln Gas Company's plant in digging trenches and laying pipe. I am not willing now to accept their records as to the fair cost for digging those trenches for piece meal work and tie
1500 to that, there are other conditions, but they would throw a good bit of light on it. My figures are less than what the company says it costs them, that is shown by the company's records what it cost them and I also had in mind the company's witness Campen's testimony which was a less figure than mine for digging in frozen soil. I am not willing to accept Mr. Campen's figures and estimate, I made an estimate of my own. I would not say that Mr. Campen's estimate would be a fair estimate, I thought there were things about his estimate that were grossly unfair; his cost of trenching which he happened to segregate was pretty low, when he didn't have the ground frozen but he run it up when he assumed the ground would be frozen. I don't agree with the statement that he assumed a real and not an imaginery case of what it cost the company to put the pipe in the ground in any month of the year. I agree to the proposition that in the construction of a plant by wholesale you would avoid doing the construction work in the winter months, but if you were running a gas plant you might have to occasionally lay a length of pipe where it extended through frozen ground. Where the service required it they wouldn't wait until spring if they asked for the service and wanted gas, but I think it is the general practice, the extensive practice that such extensions are made when the ground is not frozen, it is very exceptional to put in any amount of main when the ground is frozen. I allowed for some services that may have to be constructed in frozen ground, I have the company's main records of the cost of its service the way it laid them. As to whether I accept that cost as a fair cost, I would say it is not quite as low as it would be when laid at wholesale but it did pretty well if you will notice by comparison of the company's own labor cost with mine.

1501 I did not inquire of any of the men living in this vicinity as to the cost of removing dirt from the trenches or basement before I made my estimate; I preferred to go to the figures and not to go around and ask people on the streets. I know that there were men engaged in the business here of moving dirt, and the company has had some of them in here to testify. I didn't seek that source of information because I didn't think it reliable. I made inquiry as to the labor cost at the time I was making my estimate, in this way, by looking into the records of what such things cost in very recent times, and I made inquiry outside of the records of labor costs by getting the scale for trenching for sewer pipe in this locality from the city engineer, Mr. Dobson. I got them months ago before I made my estimate. I had that information to act upon, I looked it over and annalized it a little, I didn't have any full annalysis of it. It showed the amount per section paid to the laborer who digs the hole, that was in sewer construction. The city only occasionally does their

work by day labor, more commonly by contract where the contractor would have to pay for the labor that enters into it as a whole. There is no item of labor as far as I recall in one of those sewer districts that I can get from the engineer's office, I didn't get it, but I got the ordinary scale paid to the contractor for that labor and it was such information that I could act upon in determining the labor cost in digging trenches. I didn't get it out of the sewer districts, I got it from Mr. Dobson, I talked with him about that and I talked with one or two contractors, namely, Mr. Dobson was one, the son of the city engineer, he was outside of the City Hall, and he was the man that had the water pipe contract at Dewitt, I talked with him about that contract for water pipe at Dewitt and I got his contract. As to what information I had about labor cost here I had gotten the regular scale
1502 per section. I have that scale here, it seems to me I put it in here, if I haven't I will. This annalysis handed me of the price paid laborers for digging trenches two feet wide for sewer in the City of Lincoln as compiled by Adna Dobson the city engineer, I thought this was offered as an exhibit if it hasn't been I will put it in. As to whether this shows the amount per day to the man working in these trenches, I will say I relied more on the cost of trenching determined in another way than by that. I should think somewhere around $1.75 a day would be about right for that, from what information I have, but I want to remark that it is not customary in Lincoln to do it by the job. I didn't disregard what it would cost per day, but I thought the other was more accurate and I relied more upon it. $1.75 a day is about what I had in mind I think, only I don't think it would be done that way. I didn't figure out how many cubic yards one man would move. I made an estimate of about the number of cubic yards he moved for $1.00 when he digs it by the section he gets $1.00 per section and he moves so many cubic yards or cubic feet for $1.00 per section. I could estimate how much a man could move per day if you didn't work me all the time day and night, I have no information on that now. I haven't any practical experience or engineering knowledge as how many cubic yards of dirt one man would move in a day in a trench, that is to speak the figure right off, I have the data that it could be figured on, I haven't figured it that way, but as long as he is willing to dig the trench for $1.00 a section and I know how many cubic yards there is that suits me.

I figured the brick alone just f. o. b. and not laid, that entered into the buildings at about $7.00 per thousand; figuring that the company would get the brick on the cars at its works from people that sell brick, I don't remember the names now. I didn't investi-
1503 gate any brick markets in this vicinity to see what the company would have to pay for the brick any further than the company's own bills. From them I ascertained their cost to be $6.75 and $7.00. I have in my record some of the bills that I investigated on which I based that. Here is some brick bills from the Lincoln Brick Works on page 34 of this folder, it is not an exhibit yet but I am going to put it in, I am going to put in a whole bunch of them, I haven't had a chance yet.

Referring to exhibit "420" these two bills are in the year 1907, and I have that in mind, that is when the gas ordinance went into effect. Those are not the only two bills that I have, I testified that I had a number of others. I heard Perry Hahn testify, the man who put up the buildings, it seems to me it was the fellow who hadn't any of his records, they were all lost. Asked whether I wouldn't accept his word because he didn't have the records, because I am strong on records,—I would say I tried to get the facts. I don't remember that I heard Perry Hahn testify that these bricks cost $7.50 per thousand. He didn't testify until after I made my estimate, and I wouldn't change my estimate even though informed of the exact cost of the brick in the buildings, because it wouldn't be crucial as to what the brick cost, the question as to what they would cost at the time of making this estimate I have plenty of evidence of what the brick cost. In exhibit "422" I have a bill for 13,000 brick purchased I think, by the gas company; in exhibit "420" there are 3 items of brick here, that one at the bottom is hollow stuff sold at brick measure, I claim ther there are several bills there, a number of them. Here on September 6 there is a bill for several quantities of brick and here a bill of May first and another one of May first. The one of September 6th wasn't a purchase it was a sale but that would be the same. Those are all bills of the Lincoln company as
1504 I understand it. In exhibit "421" there are two bills for brick, as to whether there are other bills I say there are bills in the record, I didn't copy them. I have no specific knowledge about how many of these bills there are, I know I saw other bills that run about the same as those in price. Two of these bills in exhibit "421" show a price of $7.25, and two or three of the other exhibits show $6.75, and two or three at a price of $7.00 and I took the price of $7.00 as a fair price. I don't know anything about the character of those brick, what they were bought for or what they were used for, any more than is revealed by the face of the bills, they are from the Yankee Hill Brick Company and the Lincoln Brick Company, and I understand they were standard makers of brick; I took it they were the ordinary class of building brick from all the circumstances of the case. As to whether these purchases of brick I have identified here were made with reference to some particular time when the company was putting up any building,—Dates between which work was going up by the company. As to whether between each case of putting up a building one year there might be 3 or 4 years before another, and whether those brick purchased by the company and at any date that I have given here when these buildings were put up,—I would say that I would have to inspect the bills, I think they correspond. I don't understand that these brick that went into the buildings were furnished by the contractor Mr. Hahn and not by the company I didn't understand any such thing; Mr. Hahn didn't testify until after I made my estimate and the company has my estimate. There is a good deal of doubt in my mind how that work was done; I don't understand now that the contractor who put up these buildings furnished the material and labor; I can't get anything out of Mr. Hahn as to the price of how the thing

was done. I don't remember that Mr. Hahn testified that he
1505 had to buy,—not common brick,—but brick of extra quality and extra hard brick to go into these building-, anyway it was after my estimate was made and whether I would change or would not change my estimate even though it was wrong,—is a sample of the kind of cross examination, and I will let it stand so. As to whether if I learned now that those were not common brick from the man who put up the buildings and that he paid $7.50 per M for the brick that went into the buildings, whether that would induce me to change my estimate of the character of the brick that went into the buildings and their cost,—I would say that whenever I obtain reliable information that I have made a mistake as to these buildings or any other property I will change it. So far I haven't obtained any information that would cause me to change it. I didn't inquire of the Yankee Hill Brick Company to know what their price for brick was during those years, I looked at their bills to this company. I didn't inquire from any other source, I don't think that is the way to do it. I didn't go to the office of any people in this vicinity who sell brick to ascertain the price I am not sure that I went to any contractor who put up buildings in this vicinity to learn what they had to pay for brick before I made my estimate, I think I did talk with one or two in a general way. I think one of the contractors I talked with was the contractor who testified for the city, my impression is I don't think that was until after I made my estimate I don't think I ever talked with any contractor except Mr. Assenmacher as to the price of brick. I didn't talk with any contractor specifically about the cost of putting up the buildings. I didn't seek any information from contractors in this community as to what it would cost to put up one of these buildings, except that I conferred with Mr. Assenmacher, one of the City's witnesses here; I conferred with him. I didn't go around and ask them what they could put up these buildings for or that they would charge so much per M for brick.
1506 I wouldn't regard the say so of various contractors that you might ask about the cost of putting up buildings as reliable information upon which to base an estimate. I should not think the cost of putting up buildings throughout the country and throughout the Commonwealth of Massachusetts was uniform. It varies in different localities, the cost of materials and labor cause the difference in price. You seek the ordinary information as to the cost of materials and labor in the locality where the work is to be done. I do not seek that from the people who manufacture the materials and sell them, I more commonly go to the records of actual sales, that is more reliable, and people are not in the business of giving out prices just for the fun of it; as to whether I should want some further verification, I should want the records of the sales to find out what people pay for those things when they want them. When I went to the bills they wouldn't disclose just what the character of the brick were or what class they were, they might say ordinary building brick. I don't think these bills that I produce disclose anything about the character of the brick, any more than a knowledge of the general sort of brick manufactured by these concerns. There is a variation in price be-

tween different classes of bricks, but I take it these bricks the company would buy were fair representatives of the bricks it was using on its buildings, I didn't suppose the company was dealing in bricks, I thought it bought them to use. I should call the brick in the purifying house a good grad- of common brick. I would expect a bill that would show the sale of common brick to be a bill for such a representative price as went into that building. There would be a difference in those brick if they were hard burnt selected brick and not common brick; when you come to add specifications you can and do run up the price. Common brick are not necessarily the
1507 cheapest brick you can buy, there are different grades and there is a difference in the price of different grades of common brick. As to whether a bill before me showing common brick I am able to determine which they are from the price,—I looked at the bills and the buildings and I thought they corresponded. I thought the brick in the purifying house were common brick, that was built a good many years ago in 1892. I think the brick in the generator house are very common brick, they are not the highest class of common brick. There may be a difference in the class of brick in one part of the country from another, I couldn't testify positively. There is a difference in brick in one part of the country from another, it varies quite a bit owing to the difference in the clay. I wouldn't say that very common brick in Massachusetts might be a very high grade brick in one of the plants here in Nebraska, classifying the brick as common and poor, I refer more to the way brick are made whereas I was asked about different qualities in different parts of the country; I refer more to the materials from which they are made. When I figured $7.00 per thousand for common brick or assumed that was the kind the company purchased for these buildings I assumed that was f. o. b. cars at the plant. As to whether I assumed that notwithstanding I had the bill before me that told that wasn't true,—I say I think at least a part of the bills support that conclusion. Part of them are 25 cents below what I estimated and part of them are 25 cents above furthermore these are small purchases, whereas I am figuring on the reproduction of the whole group of buildings. When I figured $7.00 per thousand and referred to these bills in these exhibits as to whether there was a switching charge where these brick were placed at the plant, I think there is a switching charge of 25 cents a thousand or possibly $3.00 a car; I think it amounts to about 25 cents a thousand. I looked at it and I thought that $7.00 per thousand on the basis of those bills,
1508 switching and all, was right and enough for brick bought at sufficient quantities to rebuild the plant; I didn't take the lowest or the highest price, both of these bills here have a moderate quantity but not at all sufficient to rebuild the company's plant. The bill referred to in exhibit "420" under date of May first 1907 for 15,000 brick the switching charges were $3.00 that would show a little more than 25 cents per thousand.

In exhibit "421" the bill for the brick is a separate item, there is an item for bricklayers and labor, which doesn't disclose the quantity of brick and labor. The item for brick is $7.25 and in addition

has the item for bricklayers and labor to be added to the percentage of $7.25 showing here the cost or percentage, where they were doing some work on a certain per cent of the cost; that is one thing that bothered me with Mr. Hahn's testimony, he couldn't make it square. This was in 1909 the thing that bothered me I didn't hear anything from him about percentage, yet I saw the percentage stated in a number of these bills. Aside from Mr. Assenmacher I had no information from any contractor here about the cost of putting up these buildings, only from the company's records and Mr. Assenmacher, and I don't wish to testify that I sought information from him, I made up my estimate on the buildings before I talked with Mr. Assenmacher about the matter, and I did not change it any after I talked to him, he confirmed my convictions, I didn't change my estimate any. I had it made up and saw no occasion to change it; he made me think that I was all right when I talked with him. I didn't participate at all in Mr. Assenmacher's estimate of the cost of these buildings and I wouldn't be able to say without checking it over whether that was a fair estimate. I don't recall at all what the total was according to his testimony. I figured the brick at $7.00 per thousand instead of any other price; I figured the brick
1509 all together by count, I assumed that Mr. Lea's report of the material was based on the actual number of brick there,—and I am not at all sure of that point, I have my doubts about that,—but I assumed that. I figured $15.00 per thousand for brick in the walls, $7.00 of which represented the cost of the brick itself f. o. b. cars and for enough to do the whole job. I figured the $8.00 for the other materials entering into the job and the labor cost of putting them into the walls.

I heard Mr. Davis' testimony, the architect, as to the prevailing price and unit cost of putting brick into buildings in this community. I did not seek any information from any architect in this city to determine what the unit costs were, and what the prevailing prices were in this community for putting brick in the walls, and lumber into the buildings and stone into the foundations. I don't regard that source of information as reliable as the source to which I refer. Gratuitous information handed out by strangers isn't particularly reliable or desirable. As long as the city procurred my services and has a good contractor here that would do without hiring an architect I didn't deem it was of sufficient importance and reliability to justify the city in securing the services of any architect to advise as to the cost of this stuff in these buildings. Asked as to the fact that the contractor who put up these buildings estimated the cost of these brick in the walls at something over $17.00 per thousand and Mr. Davis estimated the unit cost for putting these brick into the buildings at something over $17.00 per thousand and whether that would influence me at all in reaching a proper price,—I would say I don't assume to say what cost he testified to on brick. I don't purport to remember his testimony. As to assuming that the contractor who put up the buildings and paid for the materials, estimated the cost of the brick at more than $17.00

per thousand whether that would influence me at all in giv-
1510 ing my judgment as to the estimate of a fair cost, I would say he would have to remember more about what he paid for things, and how he got at his cost than he did the day he came here, before I would be much influenced by his estimate. It was immaterial where he bought the brick, he seemed to be good on the points I didn't want. I didn't inquire from the people from whom he bought the brick as to whether his statements were correct. I didn't go on any fool's errands. I took it at what it meant to me as the man gave it.

I think I put a price on the stone that went into these buildings, I estimated the stone that entered into these buildings per cubic yard at $7.00, just the same as the brick. I don't remember how much that would be a perch, I would have to look it up if you wanted it figured per perches, cubic feet or cubic yards is a more convenient figure. It would be perfectly possible to convert that $7.00 per cubic yard into so many perches, a perch is so many cubic feet I have forgotten the number. It depends on the measurer as to how a stone wall is measured whether by cubic yards or by the perch. If I were measuring it I should measure by the cubic yards or cubic feet. I don't remember and I don't thing I have here how much I figured the stone itself in cubic yards would cost; it is rough rubble stone and I could make an estimate. As to where I got my information upon which I based my estimate of that cost,—I think I had some information about the cost of rough stone and made up my total estimate of $7.00. I thought I had some of the costs of that rough stone here in Lincoln, I have forgotten for the moment where I got it but more likely from some bills I saw. I don't recall having gone to any place where they handle stone to inquire about the price. For such stone as there is down there I should not care where they acquired it, whether it was quarried in Nebraska or not.

I didn't take into account where it would be secured, I took
1511 into account what I thought such stone would be worth here in Lincoln. There is a goot bit of variation between the price of stone here and in Massachusetts. The only thing I have right here as to the cost of this stone per cubic yard is the information I have given in the estimate of $7.00 per yard for the rough rubble stone in those foundations. I should have to look up my notes to determine how much of that $7.00 I figured for labor in putting that stone in the wall, I estimated that a man could lay so many cubic feet, yards or perches, in 10 hours, whatever might be the practise here. I don't think I specifically based that on any information I secured in this community; I more likely based it on my idea that I found on looking up the different data that I had. As to talking with contractors about what it cost to put in stone,— as to the amount of stone a man will lay I didn't talk with any — before I made my estimate; I may have talked with Mr. Assenmacher afterwards, I don't remember specifically that I did that.

As to the source from which I got the amount of brick per thousand and cubic yards of stone in these buildings; I intended to take the quantities which Mr. Lea had used and thought I had.

With reference to the purifying house, and whether I have the net construction cost to be $12,577. as against Mr. Lea's $16,620., I would say you correctly quote the cost I found for construction, I don't remember Mr. Lea's figures. Concerning whether that is what I regard as the net construction cost,—that is a term I have avoided, being to me an inconvenient circumlocution; I regard that as what you would have to pay for material and labor to put up that building; and in addition to that I would add 7%; that 7% is not included in the $12,577. I have here the sum total of the purifying house, the total of which I applied the prices for excavation, stone foundation and brick. For the purpose of computation I
1512 accepted in that purifying house the amount conforming to the net construction cost that is shown in Mr. Lea's report, not only the quantities but the cost both. I also assumed the amount of covering in that building and the net cost of that was as reported by Mr. Lea. I also assumed the roof framing in that building was in the amount, as far as quantities was concerned and cost, to be the same as reported by Mr. Lea; I made that assumption on every item except excavation, stone and brick.

I didn't make and produce an estimate of the cost of framing and steel and corrigated iron in that building because I thought I could very profitably devote my time to other things; those were comparitively minor matters and I didn't think they were so far off from other things as some of these things were. It was required of me that I either accept the quantities he made or make some investigation myself. It isn't true that by simply taking the items of brick, stone, concrete and excavation you could without knowing anything about the buildings, and knowing the quantities make an estimate of those four items, bur when you get beyond that you would have to know something about the details of the buildings,—that isn't true. I could accept the quantities and put a price on them for the lumber or the steel just as well as for the brick and excavation, it don't involve any greater knowledge in one case than in the other. If you are going to estimate the cost of the other covering and the item of labor you would not have to know any more about the building and about how much labor would be required than you would for laying the brick. There is no hard and fast rule by which you could say that the word covering would be so much for labor. You couldn't make any hard and fast rule that the brick in the wall would be so much per thousand, there is different prices, different kinds of walls, etc,—take such construction as there in the
1513 University buildings, you couldn't expect to get these brick that the company got down there in the gas buildings. I have assumed all those quantities, for the purpose of my estimate, and accepted the price of Mr. Lea's for the roof other framing and steel, the wood covering with corrigated iron and tar felt in the roof, and the flooring of wood, concrete, steel and cast iron, all of the prices and quantities of those as found by Mr. Lea in his report I assume, I haven't accepted any, I don't certify that it is correct excepting to say that I assumed it. It isn't true at all to say that I accepted the material, quantities, labor and prices as reported by

Mr. Lea for the stairways, doors, window openings, carpenter work, gutters, down spouts, electric wiring, wood framing, covering, miscellaneous lumber, hardware and nails. I haven't given any estimate of the cost of those parts of the buildings myself, that I have said in substance, assuming what Mr. Lea said were in the detail at so much money, I haven't certified to it. I made no direct estimate of my own, before Mr. Lea testified and furnished his report, I looked at the estimate the company's men made in the United States Court and did a little thinking about that, but I didn't make any estimate of my own.

I treated all the other buildings, the generator house, retort house and all the other buildings in the same way that I treated the purifying house. I assumed for the purpose of this computation all the materials excepting the four items mentioned, and the price of the materials I didn't accept I assemed them for the purpose of this computation, I didn't think the prices were correct but I haven't gone into that. As to what makes me doubt that they are correct I have this information, in going over some of th-se unit prices for steel and excavation and those things I wasn't able to agree with Mr. Lea at all; I assumed that he followed about the same line
1514 through his work as I have in my work, so I wouldn't be able to agree on different details in those buildings. I made investigations as to the price of steel in this community. I read it in serveral contracts.

Referee: Do you think we had better go on with that sort of cross examination where there is no dispute; no cross examination on that can change the result, I might administer a rebuke to the witness otherwise it would be valueless. The plaintiff excepts.

(Witness continuing:) Whether on the items of works equipment I have the net construction cost $160,069.00 as against $218,358.00 in Mr. Lea's report,—I have the figures here for the works equipment $160,069.00, with what anybody else wants to show as a matter of evidence based on the same thing I am not concerned. That is the net construction cost of the works equipment per my cost with the items eliminated such as the East Lincoln holder. My figure $160,069.00 does not include the East Lincoln holder equipment. And as against that assuming that Mr. Lea gives his figure at $218,358.00; that is right, but his figures includes some items that mine didn't. My report would omit some things and his put in some things, but I think it is true that all items of property are entered. I did not in any way shape or form, apply any percentage of Mr. Lea's net construction cost in reducing that cost to the cost I gave as my net construction cost, I didn't derive my cost from him in any way. I did not consult his cost in arriving at my own except to form my list, I did take his quantities for foundation of the apparatus for concrete foundation, I did not take his price, I accepted his quantities or Mr. Brodnax's quantities, I accepted the quantities as shown in the testimony of the company for the excavation and foundation necessary to make them up.

1515 In a general way where I found the 6′ water gas set and the Springer set I took the two sets and found what a new set

with a capacity equal to those two would cost; and then depreciated that new set according to the ages of those two old sets and in that form and way I arrived at what I considered the labor and material cost of those two old water gas sets was. That doesn't include anything for anything of my 7% for overhead charges. That doesn't include the engineer in supervision of it on the part of the purchaser, it includes any supervision that the contractor would do, or have over his men in putting it up at the contract price; it does not include supervision on the part of the purchaser in looking out for his interest. As to whether I have had any actual experience in the purchase of any of this equipment which I have valued here,—I have repeatedly gotten quotations that I might have closed up if I wanted to buy. As to whether I got those quotations for the purpose of buying, I got quotations in connection with the Ypsilanti work and I thought we would buy at the time. Whether the prices for this equipment are uniform and remain about the same all the time,—I can't say that exactly the price for machinery such as is generally involved in such open market prices as you get on floor and steel rail, but are prices that may be known to anybody that takes the trouble to look it up. They run about the same within the period of years we are talking about, the tendency has been down a little; they wouldn't run the same between different purchasers, taka concern that makes water gas sets they will sell to one man two or three hundred dollars more than to another. Asked whether I know that from any actual experience in purchasing,—I have sold and made machiner- for years. I never sold any gas machinery, but the machinery market doesn't differ very much whether it is gas or electire machinery; machinery is sold at a little different price to different buyers according to the circumstances of the case.

1516 Whether I took that into account on this machinery, I didn't use the lowest price, I used what I thought was a fair price.

Baulen & Hargood, Isbell, Potter Co. of Newark, N. J., Western Gas & Construction Company, E. Little Brown in Boston with the works at Waltham; Bartlett, Hayward & Company of Baltimore, and Davis & Farnum Manufacturing Company are the princip-le manufacturers of gas equipment. In this western country the Western Gas & Construction Company, the Kerr Manufacturing Company, Stacey & Company of Cincinnati is an old house; and of course Sturdevants are making a good many gas blowers, they didn't use to be in that business. When it comes to benches the St. Louis people sell considerable of their goods. I can't say off hand whether I am lower than Mr. Lea in his net construction cost on all of the water gas equipment, it may be so. I can't either affirm or deny that all the blowers, exhausters and in fact all of the items, with the exception of possibly 3 or 4 items in the entire works equipment whether I am lower than Mr. Lea, I should not be surprised to learn that it is true since my total appears to be less. I should say that in the vast number of items which go to make up the works equipment there is only 2 or 3 items in which my valuation is not lower than Mr. Lea's, I should say that is possible, that is all the equipment that can be purchased or is purchased in the open market, and sold by such men as

Mr. Steinmuller who testified here; I think he represents the one concern that supplies in this western country more than any other concern engaged in the manufacture of gas equipment; they do supply a good deal of stock out here. If I were expecting to buy the appliances or were going to build a plant here I would expect to take the matter up with Mr. Steinmuller but I should expect to get better prices; he said he could better those prices if there was a chance to make a sale. I should have taken that into account if I had
1517 heard his testimony but I didn't hear that until after I had made my estimate, that was when the company was putting in its second case. I would expect to be able to get the better price, and am not at all sure that my prices are higher than his, I thought he gave some prices that were down not very far from my estimate. He gave the cost of the water gas set itself at $8,000.00. The particular water gas set in this plant purchased from the Western Gas & Construction Company which was sold by Mr. Steinmuller, and asked if I didn't make the cost at $7,506.00,—I would say that I don't assent to that that there was $500.00 difference for exactly the same thing between Mr. Steinmuller's and my figures; $8,000.00 might cover something else besides the water gas set that I had $7,500 on. He testified very fully on that but I don't assent to the proposition that if he did include anything else I wasn't able to discover it; I think on a comparison of his figures and mine you will find any such discrepancy. I should not — all hesitate to stay by my own judgment about the cost of that equipment in view of Mr. Steinmuller stating that the fair price of that water gas set was $8,000.00, and particularly in view of his company furnishing it; not at all by his figures because he was testifying just as I am. I know the selling price of quite a number of gas sets, and he probably knows more than I do; he said his price he gave here in evidence wasn't a hard and fast price but says it is a price that might be bettered under some circumstances. In estimating the fair reproduction cost of this plant I would have to assume in all of these items of equipment that I would have to pay the market price, but Mr. Steinmuller said if he was putting in the whole thing he would get less than his figures. Whether you could afford to spend the time going out and jewing him down,—I would say people who know you are going to put in a plant will be here if they think you have the money. I
1518 never built a gas plant but I have watched a good many. I have built other kinds of plants and sold other kinds of machinery and have been in the business a good many years. I have been devoting myself exclusively to engineering between 25 and 30 years, I began in 1885 and have been at it ever since. It has been in connection with a number of manufacturing plants, I have been the manager of the sales department and the engineer for plants manufacturing machinery and have been the manager and superintendent of public service plants, not the last 10 or 15 years it was all before that; I have devoted my time during the last 15 years to engineering matters, but I haven't forgotten everything I knew before. Of course, there is some information here, about the price of these things since I ceased to operate any property, in which there

has been some changes in conditions, equipment and price, but I keep in contact with it by watching the prices other people pay for this kind of stuff, I mention it if desired. I am 49 years old and 15 years off of that would bring me back to 34, it is more than 25, and I have gotten in the habit of saying 25 years but it is rising.

In my exhibit I have given what I estimate to be the life of various items of equipment in the plant, based upon my study of the life of gas equipment in a great many plants. The life of equipment in various gas plants varies somewhat in different cities; it is affected slightly by climatic conditions but in climates that I am familiar with it might make some difference; it might in the tropics or some particularly hard place the life would be shortened, but take the climate between here and Massachusetts, while I suppose there are some minor items I would think other factors would be apt to obviate any great difference. As a general proposition I should think so far as the mere physical capacity or physical existence and use was concerned the life of an equipment would be substantially the same here as in Massachusetts; various other factors have
1519 to be considered in figuring the useable life of a piece of equipment. I think the life of this plant should and would compare well enough with a good many plants in Massachusetts. The life of these various pieces will vary in Massachusetts, which I have proved in tracing out the life in Massachusetts. I see no reason why a water gas set purchased from the Western Gas & Construction Company, why the life of that equipment would vary in this plant from the same equipment being installed in a plant in Massachusetts. In giving my estimate of the life of this equipment I took into account elements excepting the decay and wearing out. I took into account the element of adaptation to the business and inadequacy; I thought on the whole the figures I assi*n*ged were as fair estimates as I could make as to the probable life of this equipment in this situation. I took into the account the element of obsoles-ence, although I didn't give that its full weight in all cases, for instance, the Springer set, I think that set is really depreciati*o*n beyond the point where I depreciated it; but I gave, as I did in giving the full value of the mains that lead into East Lincoln, I gave the company the benefit of the doubt, I am not anxious to cut it down to the last dollar. As to what other elements I took into account in estimating the life of the appliances in this plant,—I considered in the first place the capacity and the physical existence for use, which is decidedly greater than the actual useable life of a piece of equipment. Taking the water gas set I think to some extent a part of that estimated life is affected by the element of inadequacy. That 6′ 6″ water gas set is a standard unit of construction but there are plants where a 7′ 6″ wouldn't be useable at all, it would be too small. But dealing with this plant in estimating the life of that water gas set I didn't shorten its life by any considerable extent because of inadequacy, that was simply one of the factors that go to make up my judgment and figured in a minor way in making up that judgment; I
1520 certainly did not deduct from either one of those 7′ 6″ sets any specific sum on account of inadequacy. Leaving out the

Springer set and the other 6′ 6″ set and taking any other appliances, the scrubbers, exhausters or blowers, I don't think any specific measurable allowance or deduction for inadequacy went in anywhere else except these water gas sets,—apart from this consideration that in making up my mind as to about the fair life of these sets I necessarily have to refer to the lives of similar sets in a number of other plants and undoubtedly these lives were to some slight extent expressed in some particular instances to a large extent affected by inadequacy so that may be reflected in my judgment, but don't go in a direct way in those sets. I didn't deduct any specific sum in considering the distribution system where the gas mains would be too small to meet the demands of a particular portion of the city, as to any gas mains. I could not form any conclusion and give any division between inadequacy and obsolescence on account of the actual wearing out of the machine if any. I have given it at the life based as best I can. Whether I have an opinion at all affecting the division of those elements that enter into the life of equipment,—none that I can express by mathematics, by minute inquiry into the different pieces of apparatus I might get at the weight of those particular pieces, but their weight would vary. The general life of appliances in this plant as to some appliances would be the same as similar appliances in other plants but not all others because the life varies in different plants. I would not say that the estimated life of the gas holders down here would be the same as the estimate of the life at other places throughout the country, it is longer, take at Springfield, Ill. where I made an estimate, I estimated a shorter life, the conditions affecting the life of a gas holder in Springfield and not affecting the life here were that they are going to move their plant just as this company did a few years ago outside of the ele-
1521 ment of moving the plant the conditions are similar, I don't know as they would be absolutely the same. Whether there are any fixed estimate- by which engineers estimate the life of appliances of that kind,—the only way I know of is to take in the first place about the time that apparatus will last if given a chance to last, apart from decay and inadequacy and obsolescence and see how far those factors of inadequacy and obsolescence are going to come into play and see if they have affected it, as at Springfield. I don't think there are special conditions that affect the life of this equipment that are not present in most any gas plant. I would give the life of this equipment as I regard it, as the normal life in a great many places. I haven't been able to discover any uniform standard recognized by engineers as the normal life of equipment as found here, the engineers don't agree; it might be true that some engineer don't even agree with himself, a conscientious engineer sometimes changes his opinion, I should want to know all the facts before concluding the oftener he changes his opinion the greater the indication that he is consciensious.

I testified as to the life of equipment at Racine, Wisconsin and furnished a tabulation and stat-ment advising that commission that I had spend considerable time and had given the matter considerable thought before I reached a conclusion and at that time about 7 or

6 years ago when I reached that conclusion and I have been studying ever since. I would not testify that a brick building as well as appliances or anything would be uniform throughout the country, a great many fact- might affect it. I can't think of any reason why a good brick building in Racine, Wisconsin at the plant wouldn't be as long lived as a brick building at the plant here, on further study I might find some reason. I said that where I gave 1% annual depreciation I meant that that equipment had an assumed life of
1522 100 years. I don't know whether I estimated the life of the retort house and purifying house in the Racine case at 100 years, if I did I have since changed my opinion. I don't recall just when I changed it, but I haven't given that life for brick buildings in recent cases, for instance, the Haverhill and North Hampton cases. I don't recall what I gave as the estimated life of the gas holder at Racine. I don't remember whether it was 100 years or not. I got the information upon which I based or assumed the estimated life of the equipment at Racine mainly from plants in Massachusetts. At that time I had studied these reports and records for 6 or 7 years, not only the records but I had been to the holders and look them over at that time I thought from the information I had a gas holder had an estimated life of 100 years. I thought that was fair at the time to give it. I knew of data that tended to support that. I have since accumulated a good deal more data and concluded that that was too long. I might have done the public an injustice by not knowing what I was advising the commission. I wouldn't say the company but these are matters of estimate and we make the best estimate on the data we have.

I presume I estimated the life of the benches at Racine; I may have estimated that life at 50 years, I don't remember all the lives I gave. I know my opinion as to the life of gas equipment has changed since I testified in that case, possibly has changed on every item of equipment connected with a gas plant, I couldn't testify as to that. In assuming the life of this place and the figures assumed by me I have not given figures that gave me an easy computation. Asked whether I assumed a large amount of this equipment at 66.6 and a large portion at 33.3 and did it because in one case that is 1½% and the other case it is 3% depreciation and whether I did not to that for a mere mathematical convenience,—I say I did not, I did on the ¼ of a year for an easy mathematical computation. I didn't
1523 consider that my information was sufficiently accurate and precise to fixing positively as to the fraction of a year on depreciation so when I think it will last about 33 years I didn't hesitate to give the company the benefit of ¼ of a year and make it 33¼. If there are any engineers who can fix depreciation accurately I would like to here them talk.

When I got to Cedar Rapids it was in 1907 or 1908 and at that time I gave the court my opinion as to the estimated life of the buildings and equipment. I think my opinion at that time was that the lives was somewhat longer than I gave the court here, consequently the annual depreciation less that should be charged in the operating expenses. The result didn't count it was the fact I was seeking, I

only pointed out the consequences. I didn't point out the result whether it would be more or less in the operating expenses; I am not looking to be unfair in one case any more than the other, I am trying to find the truth. In Cedar Rapids I gave the buildings at 100 years in Racine at 80 years and at Lincoln to 66.6 years, which shows that it is consistent, what the reduction will be next time we can't tell until we get to the next case.

Possibly I estimated the life of the gas holder in Racine at 100 years; at Cedar Rapids 80 years and in this plant at 66.6 years.

And possibly the benches on which I estimated the life at 50 years in Racine, 40 years in Cedar Rapids and 33.3 years in Lincoln, possibly they were similar benches.

At Racine I think that all coal gas and that is my best recollection; that was 7 or 8 years ago and I am not sure; I know that they had coal gas there and it seems to me that is all they had.

The scrubbers and condensers at Racine I estimated 50
1524 years at Cedar Rapids 40 years and I estimated them at 40 years here too. I reduced their life 10 years between Racine and Cedar Rapids, my figures changed, whether that is more than one year between Racine and Cedar Rapids it might be computed in various ways. In this plant I have the scrubbers and condensers at 33.3, an easy computation, I rather think that is an oversight if I had it to do over again I think I should put all the scrubbers and condensers on the same plane; they will fairly last a little longer than the shells that contain the fire; I should think 40 years was all right, I thought I had it that here; that was my purpose and would be my judgment now and 33.3 as it appears here should have been 40 years.

As to wrought iron mains in Wisconsin I probably gave their life in Racine if they had any wrought iron mains; I think it is safe that my opinion as to that life has shortened somewhat since the Racine case. If I gave the life of the mains at Racine at 100 it seems incredible, I should not assent to that, that I thought wrought iron mains would last 100 years if I gave cast iron mains in the Racine tabulation at 200 years and wrought iron mains 100 I certainly have shortened on that now.

At Cedar Rapids I gave the life of wrought iron mains at 80 years so I came down 20 years there. Here in Lincoln I gave the life of cast iron mains at 50 years and I have given that in a number of other rate cases, the other figures are going back a number of years; I have changed my opinion as to the life of gas equipment; they were very angry in the Cedar Rapids case because I made it so long.

Whether at Cedar Rapids I gave the estimated life of the tools at 40 years and Lincoln 10 years.—I don't remember about Cedar
Rapids, 10 years here is all right I don't recall the estimated
1525 life of the tools at Cedar Rapids at 40 years. History and my own observation of these structures of different ages as I look at them is the tangible thing upon which I base my conclusion of the estimated life of these various items of equipment. The opinions of engineers vary from one case to another and it renders that source of information of very questionable value and very little used

by me; where I use the information of engineer, it is more particularly where they are reciting facts and giving opinions in engineering transactions. Whether the engineer in this case took into account the final result in the case we were seeking to obtain in fixing the life of the equipment I don't know, I can't say about others; I didn't have it in mind, and didn't have the slightest idea how it would affect the company. I know that the life I gave of this equipment materially affects the question of depreciation and the amount that should be taken out of the operating expenses to cover it, just as it affects the value of the materials. I know that the longer life you give the important items of equipment the less you are required to take out annually to cover depreciation, and the shorter the life the more. A change in the life of the equipment changes the amount that must be allowed for depreciation. I don't think that is an item of sufficient importance that there ought to be some fixed standard by which one engineer would use the same method and same result in all the cases he has testified in, I think he would be a very dangerous man to tie to any one result. I don't think he would be if he wasn't tied to the same result. I think it would be more dangerous if they didn't change it when they got additional information; I have to change mine constantly and have in the last 7 or 8 years.

When testifying at Cedar Rapids I had been a student of the Massachusetts reports for 7 or 8 years at the most; in that 7 or 8 years of study of the Massachusetts report I certainly acquired sufficient information to estimate the life of equipment to have some fixed opinion about it and have since then. I have obtained a great deal more information, from the Massachusetts reports and some other sources, and from the complete schedule that has to come in officially giving the life of almost all companies' equipment in the Commonwealth of Massachusetts which I have had access to and a copy of, which I didn't have when I testified to the life of other companies where I have given similar lives to that which I have given here. The conditions as to the lastings qualities of the apparatus were similar where I have given similar lives or I should not have done so.

1526

I appreciate that if I lengthen the life of this equipment it will reduce the company's operating expenses below what it has reported and below what I have allowed. I allowed so much for depreciation, I couldn't have allowed that if I had given this company the same life that I testified to in Cedar Rapids and Racine it would have been a less amount. If I had shortened the life here I realize that I would have to provide out of the earnings of the company a sufficient amount of money in returns to take and care for that equipment for the shorter period of time. It would require a higher rate to care for the equipment and the company would have to have more money for depreciation annually; and you would cut down the value of the existing plant correspondingly. I never testified that it is a matter wholly indifferent to me whether you make the life long or short as affecting the rate charged here for gas. All I have meant to say on that point is that if you change the rate of depreciation you change both the value of the property and the operating expenses;

you change them as regards the interest of the consumer, but in opposite directions so they tend to compensate. I never did say that they did compensate unless you take some suppositious case.
1527 When I fixed the life of the gas holder at 100 years at Racine that would mean that the consumers would have 100 years within which to accumulate sufficient out of the earnings to care for the cost of that gas holder; and when you shorten it to 50 years you would have to double the rate that the consumer would pay to take care of that holder, I have always figured it that way; I haven't made any mathematical gymnastics in that connection, but I have in making 33.3 to this 66.6 and 33.3 of those particular amounts.

I didn't make any inquiry in this city about the life of wrought iron pipe. If wrought iron pipe is used in the water department I don't know about it, I didn't inquire. Commonly they use cast iron for mains, sometimes steel and sometimes wrought iron for service. I inquired whether they used cast iron pipe in the water department. I didn't inquire as to the life of the cast iron pipe, and there wouldn't have been any particular use in making that inquiry; the best I could have done would have been to find the extent to which mains have been replaced during the short period they have been operating. You understand I have the record of the Massachusetts mains for almost 100 years in some gas plants. When I testified at Racine I had an opinion as to what the life of cast iron and wrought iron pipe was, which I have since concluded wasn't correct. Asked whether that was based on 100 years in Massachusetts I say I didn't have the knowledge of that 100 years the experience was there but it wasn't in my mind and not all of it in my possession. I didn't inquire of the water commissioner of the life of these cast iron pipes were here in the water department; I didn't think the information he could give me would compare in weight with the information I had. If I had inquired of him and he told me the life of cast iron pipe was somewhere between 10 and 20 years as to whether that would affect
1528 my judgment on that pipe I would say I would have thought something terrible was the matter, I should have tried to look up the matter to see why it only lasted 10 to 20 years. The question of alkali in the soil affects the pipe; gas don't injure the pipe, I can't put any limit on it as far as gas is concerned whether it would last forever or not. Electrolysis, sometimes the change in the requirements as to the size of the pipe caused by the shifting of the population makes it obsolescent, so before you could determine how long it should last in the ground you should know something about the character of the ground. It may be that in ground like the Salt Creek bottoms here you wouldn't expect it to last very long. In some soil the pipe wouldn't last any longer, I haven't seen any of it and the company hasn't got much of it there. I have examined the soil away from Salt Creek as well as I could. I can get some idea of the soil by looking at the pipe, this is good soil in Lincoln as to the pipe to the best of my information. Asked whether if I wanted accurate information on that I could get it from the University Agricultural Department where they have a man whose business it is to test soil,—I would say that so many burdens have fallen on me that I

didn't get around to the University but I am going to if the case is kept going long enough. I have put in a good many records of actual cost into this case, actual facts aside from opinions; the question of the life of pipe is an opinion and will still be an opinion if I get up to the Experiment Station of the University and found their test of the soil; I don't claim that I have exhausted the situation at all.

As to when I testified in the Cedar Rapids case I am not sure of the year, my impression is it was about 1907 but I am not going to tie to that date. I think I testified in the Racine, Wisconsin
1529 case within a year of the other date whether in 1909 I can't say as to that but I will endeavor to look up the record.

My recollection is that the Racine case preceeded the Cedar Rapids case but I am not going to tie to that until I look it up.

My attention being called to the following question "In these various places where you say you appeared as an expert Watertown, Salem, Cedar Rapids, and Fall River, were those contested matters," it would appear from that question that Cedar Rapids preceeded Racine but I would have said the other way.

My attention being called to what I did in Racine in the way of examining the property and to my testimony that I had spent perhaps not more than two or three hours looking over the company's property with the superintendent and that that was the length of time I spent in making that examination, if I made that statement it was correct but it was not such an examination as I would make if I was going to value it by any means. Upon that examination before that commission my testimony was not wholly a matter of criticism of the operating expenses and values of the property furnished by the company. I had the schedule of that property, it was made a part of my opinion. And the statement that I didn't spend more than two or three *house* at that property before I was ready to testify as to the value of the property is an entirely mistaken stat-ment; it took me a number of days before I was ready to give any testimony but there was no use of my standing there at the plant and looking at the equipment.

I have no recollection that I based my valuation and undertook to justify it by being informed of the total amount of gas the plant manufactured in the year, and found out how many consumers on what the company valued its property, and found from the
1530 valuation return of the company of its property and the amount of gas it sold and delivered would be $6.00 a thousand,—I certainly never anywhere used that as an entirely precise basis of determining value I may have suggested to someone at some time in connection with that case or elsewhere that so many dollars per thousand was a common amount to find in gas plants. I did not value that property in that way. I want to be understood all along about what I testified to at Racine and Cedar Rapids I am not assenting to any specific years of life that counsel suggested; I have answered the question freely but I don't assent to any such thing. If I testified in the Racine case I have taken the figures I find in that report that 155,972,000 feet of gas were sold December 31, 1907, I have taken the figures $936,010.00 being the totals as exhibited and

showed the number of items 1 to 12; I have taken that total and divided by the thousand feet of gas sold and I find it gives the $6.00 according to my arithmetic and my best judgment is, considering the way the City of Racine lays, the best judgment I can give of it that is certainly an excessively large figure to do the gas lighting in the City of Racine $6.00 per thousand annual sold." I would testify the same way now. I took that valuation of $936,010.00 and criticised it upon the basis that that would give them $6.00 per M feet of gas sold annually, and that was an excessive amount for that valuation. I said I thought that $6.00 per M was an excessive amount and I guess they agreed with that by what they did. They agreed with me generally and reduced the price of gas and cut off some equipment used for outside services.

Asked if that is a short cut to a valuation of a gas plant,—I will say I didn't value the plant in that way, if anybody chooses to do so they may. I have very recently heard the ex-president of the Gas Light Association of American used it and some Commissions use it,
I consider its use a very short cut. You can give a line on
1531 whether it is up or down but I have never used it as a means of an accurate valuation.

In connection with that statement of $6.00 per thousand feet being an excessive amount for Racine whether I didn't make this statement: "Now as I said at the start I haven't been asked to and haven't attempted to value this property," I don't remember whether I made that statement or not. I made the division by finding the number of thousand feet of gas and took the valuation the company gave of its own property and divided it and said that resulted in $6.00 per M feet annually, and I said I thought that was too large per M feet of gas in Racine that wasn't a valuation of that plant and didn't purport to be.

Taking the dist*irub*tion system in Lincoln I found the cost of labor and material entering into the distribution system corresponding with the net cost as found by Mr. Lea, and I found the amount to be $324,659.00, but I am not at all sure that that includes the service governors; if that doesn't include the service governors I wouldn't add as much as $18,000.00 for them, I would add what I thought they were worth. What the item is I would say they would be worth I would have to look up I haven't the exhibit here. As against that item perhaps Mr. Lea has the net construction cost of $529,736.00 I haven't *the* it before me.

The amount of the gas mains, that is the length of them, and the size of the gas mains I have taken as corrected by the company's own witnesses. Whether also as corrected by Mr. Lea in his report, I didn't see the corrections in his report; I don't understand that the figures I used are found in Mr. Lea's report, if they are I didn't see them. The corrections were made by the company's if that document called a report was filed. I don't deny that the corrections were made by the company, but I said I took the company's corrected figures. I am glad the company discovered the errors
1532 itself. Here is a schedule of mains that I used. The combined amount or total feet of 1¼ and 1½ inch is 2,258; the

total feet of the 2 inch 315,708; the 3 inch 406; 4 inch 94,274; 6 inch 25,873; 8 inch 4,568; 10 inch 9,810; 12 inch 3,613; 16 inch 1,269; 20 inch 1,472. If Mr. Lea finds and reports in his report the exact figures I have given for the size and length I should say that I assumed his figures because I did assume the figures in the company's correc- statement. Whether the difference between my valuation and Mr. Lea's is the difference in cost, because we agree on the size and extent of the mains,—I should say we don't agree at all on the size of the mains, we agree on the diameter but Mr. Lea thinks they are heavy pipe and I think they are light. I have assumed the length stated, so the difference between us finally is one of size and cost, the size affects the cost because you buy it by the ton and the size as to the weight and thickness of pipe I am talking about. The weight is only material as it affects the cost. I haven't sufficiently annalized Mr. Lea's report so that I may testify about it, and as to whether the difference o. $200,000. in the distribution system lies only in the matter of cost I didn't testify to it on direct and I don't propose to now in the way of an annalysis. When I come to the distribution system and taking the 4 inch pipe I presume I do reach a different result on the cost and value of that pipe in place of that found by Mr. Lea, I don't have Mr. Lea's figures in mind, I have mine.

I don't recall in the trench that was to be dug for the 4 inch pipe whether I made a narrower trench than Mr. Lea; I can tell the width of my trench; for the 4 inch pipe my trench was 18 inches in width; if the width of the trench used by Mr. Lea was 22 inches he used it too wide. In the width of the trenches I referred to in the water commissioners' office upon which I assumed to compute
1533 the amount of cubic feet of earth removed in the laying of the water mains and being asked if that was 24 inches I reply 18 just as much as 24 and the schedule I figured out yesterday was 18 and 24 inches; it contained both figures and was figured out both ways, that was for deeper trenches in the case of the water works. As to the proposition whether I took an 18 inch trench for 4 inch pipe as against a 22 inch ditch as assumed by Mr. Lea,—I am not testifying what he assumed. I did not make any inquiry at the gas office or the foreman in charge of the work of putting in gas mains to ascertain from him whether it was an 18 inch, 22 inch or 24 inch, trench but I measured at least one gas trench, I am not sure whether I talked with the superintendent of construction or not. If I did I have forgotten what he said. Whether he would be the party who knew from actual experience,—I was too — when I laid the rule across the trench. That was in one of the earlier days I was here, before the company found out I was such a bad fellow. Where it was you can't find out because the witness don't know where it was nor when it was except it was in the early part of the time of my being here, I can't — the date or where. I haven't found anything in the gas company's records that show anything about the width of the trenches. I haven't found whether there are any general specifications or directions issued by them to their foreman in the laying of these mains. I think I did talk with Mr. Backster the superintend-

ent of construction about the width of the trenches, but that is indefinite in my mind and I don't remember it. Whether I would rely on it,—it would be worthy of considerable consideration. I am sure I made inquiry of Mr. Backster about the depth of these trenches. I would not have to get my information as to the depth of the trenches from the man who put them down I could measure them as I did. I measured the depth of them and I found them to be about the depth I have allowed 3 inches over the pipe. I measured
1534 one ditch and found the width and depth and it had 2 inch pipe in it. It was not upon that one that I based the width and depth of the trenches of this distribution system, that was only one element; I talked with Mr. Backster and with a number of other people, and with the water works people. The impression from all the information I could collect was that the depth of the trenches that I have shown was the proper width and depth and was a suitable width and depth. I haven't made the trench narrower or shallower, I don't know what the company made it, I had a great struggle to find out from Mr. Lea what his trenches were, if it is in the record I don't know it. I don't know that the specific information with reference to the width and depth was in the record and always has been. If I had known that I certainly would not have acted upon that information as I found it was a mere estimate of Mr. Lea's, as the testimony of these figures were already in the company's records. When the company presents to me their statement of the width and depth of these ditches whether I would accept that for anything,—I would say a statement out of the company's records I should accept for all I thought it was worth, and give it a good deal of consideration; but when a man goes and makes an estimate about a plant and testifies that all is stuff that didn't come from the records at all I don't deny and don't look to see what they show, they may be right and I may be wrong but I am not bound by it. Mr. Backster told me what they have in feet and I paid more attention to that. Mr. Backster didn't say that these trenches were 22 inches wide. If Mr. Backster does say that these trenches are 3 feet 6 inches deep for 4 inch pipe there is no telling what I will do about accepting that unless the company gets him here. I had information acquired through different sources, except this trench I examined and what Mr. Backster told me also the city engineer and the water
1535 people, and I have gone to see these trenches and also one or two contractors; I inquired of the contractor about these trenches I didn't inquire at the same time about the cost of putting up buildings some contractors don't do that work, I happened to strike a contractor that I though- would tell the truth, that was young Mr. Dobson. I won't attempt to tell what he said but as a result of a series of talks this fairly represents the width of trenches in Lincoln. If I am mistaken in the depth and width of trenches if they were wider and deeper but I am satisfied that this is ample, I have seen considerable water pipe and it don't change it any bu any gas or water or whether those lighter pipe that this company claims went into it. I took their written reports. I think it is close to 17 pounds per foot for 4 inch pipe. Because the company went down

to the plant and weighed the 4 inch pipe and drew my attention to the actual weight of the pipe in use and found it to be over 19 pounds to the foot, during the time that this testimony was being taken I don't consider that a criterion of what had been laid 25 years when the company's records *records* belie that. I claim there is a record of the gas company that will support my claim that the 4 inch pipe only weighs 17 pounds. I don't claim that the company's records show 17 pounds to the foot but I claim its records support that; that is exhibit # "212." I didn't say that the record of the company was that the company's 4 inch pipe weighs 17 pounds to the foot; I said the records of the company support it, I didn't say I got it from the records theoretically. I will refer to the records that tend to show that the 4 inch pipe of the company weighed 17 pounds to the foot. I have a lot here of the company's vouchers showing the shipments of pipe but have not assembled any back of 1901 because I couldn't find any and they said they didn't have any. I assembled all I found vouchers for showing the character of the purchases; and the weight is shown on those
1536 vouchers in every instance, and the weight, and price per ton and size is shown on the vouchers in every instance. I assembled an exhibit in the same connection with those vouchers showing the cost the company paid through many long years back for 4 inch pipe and all other sizes. That exhibit is known as "212"; my recollection is that in that I included all of the purchases as shown in exhibit "210" and the method I followed was to take the vouchers and showing the weight and size of pipe and reduce that to the weight per foot and then shows the cost of that pipe per ton in exhibit "212"; I think I got everything in exhibit "210" and also into exhibit "212" and the result of the purchase of the 4 inch pipe as shown by all of the vouchers included in exhibit "210" and showed by the weights I found per foot was that the 4 inch pipe weighed 18.8 pounds per foot as against over 20 pounds assumed by the company's report; and as against 17 pounds that I assumed; and that only goes back to 1901, back of which the weight was lighter in earlier years.

Those weights shown in exhibit "210" are not only shown in the vouchers of the company but I got this purchase in 1892 of 93.7 pounds for 16 inch pipe out of one of the company's ledgers, and there is a lot more that I couldn't find the vouchers for; you take in the cost of pipe there are some purchases that I couldn't find any vouchers for back of 1901, but I have purchases in exhibit "212" away back to 1876 but that don't show any weight except light weight. The voucher dated January 17, 1913 and the pipe shown to have been purchased there *in* looks like one of the weights I have in exhibit "210", it looks like it, but there seems to be a variation of one pound in the total weight but I should think that was the item; 175 pieces of 4 inch pipe weighing 39,487 pounds the voucher says 39,488 pounds there is one pound difference. The vouchers also shows 200 pieces of 4 inch pipe weighing 44,838 pounds and these average weights are only 18 pounds and a fraction, the latest
1537 purchases of pipe. When I assembled the cost from these vouchers I don't know whether I included the price per ton,

I intended to. I haven't any purchases here for 1912. This voucher I used for the purpose of getting the weight I would say that I did not use the highest price per ton for that pipe found in the records of the company, it don't come anywhere near being the highest price there are totals higher, that price is $31.55 for 175 pieces. I don't know whether I assembled in this exhibit all the vouchers except the one I used in the weights, I intended to get the same vouchers I used in the same tabulation but I didn't get any vouchers in this tabulation of prices after 1912 whether I included the vouchers of 1909 showing the cost price of $30.00 per ton on the vouchers I used for weight,—will say that I intended to get them all in, I hope I did. In 1910 I intended to use the price per ton varying from $27.55 to $30.00 per ton from all the vouchers I used to get the weights in exhibit "210". And in 1911 I intended to do the same excepting the price was $29.00. And in 1912 I used the same to get the price of $29.55 that I used to get the weight. Whether on the vouchers following that which I used to get the weight shown in price of $30.55 per ton and that I didn't include,—I would say that table was made up later than this price table. I made up that table of weights after I made up the table with a copy of the bills showing the price per ton which I run down to the year 1912 and stopped and didn't go into the year 1913; when I made up the later tables showing the weights and deductions, I appeared to have got in a couple. I took whatever I had and rejected nothing that I had when I made up the respective tabulation. Whether there is more than one voucher for 1913 than the one shown in exhibit "210",—that will show the same date, that may be on the same voucher, they are two

1538 different bills and that is what I went by, I didn't pay any attention to the company's various office bills; I got hold of both and put them into this weight tabulation. I didn't put in the cost but I have contrary to statements made several cost of pipes in this tabulation that are decidedly above that $31.00, but they are back of 1909. I think the item of cost os $31.55 per ton is more per ton than I allowed in my estimate of cost; I should not consider a small purchase of various priced pipe that you made here in Lincoln would be as low as if contracted for in one transaction. When I found these bills of weight the reason I used the 17 pounds instead of the 18.8 pounds, in the first place I got from an investigation of the records of various companies that the gas pipe used ran lighter prior to 1900 than since. The 4 inch pipe we are talking about particularly was made regularly for many years by one manufacturer down as late as 1901 at 15½ pounds, and that is R. D. Wood & Co. Whether I have been advised that they don't furnish any pipe out in this country I will say I know they do furnish it. I have used Kent's Pocketbook and found the weight of pipe in that a good many years. Asked if it wasn't Kent's Pocketbook that told me the weights was 17 pounds per foot,—I know as stated, as a general rule in the earlier years prior to 1900 gas pipe was lighter than since then, The American Gas Light Association in 1898, the then authority or association representing gas interests advised that 17⅓ pounds for 4 inch cast iron gas pipe and R. D. Wood & Company made it

15.5 pounds down as late as 1901, and before that; and the Addyston Pipe Company advertised it at 17 pounds in their standard list which is represented in Kent's Pocketbook and the Addyston Company was one of the combination of companies, as shown by me in exhibit "217", that I assume made pipe of about the same weight, they were working together in a business way; and it is in brief my main reason for thinking that 17 pounds, taking the entire record
1539 of the company was enough for 4 inch pipe. The American Gas Light Association in 1898 recommended that the weight be 17⅓ pounds, but Kent's Pocketbook fixed it at 17 pounds a difference of .33 of one pound, so back in 1898 at least I think it might have been lighter than 17 pounds. One maker,—R. D. Wood & Company, one of the oldest in the country,—I never heard of them making 4 inch pipe for gas purposes greater than 15 pounds. I had access to the company's records and know pretty well from whom they purchased their pipe because I have given it here in exhibit "212". I don't think I found anywhere in the records any purchases of pipe from R. D. Wood & Co. I didn't examine the company's records in Des Moines to find out where they bought their pipe. I know that R. D. Wood & Co. do sell pipe in this country, I just looked up a lot of their records of selling stuff up in Wisconsin. Whether they ever sold the Lincoln Gas Company,—I will say that I can't get the record back of 1900 because the company's vouchers had all disappeared. Of the company's vouchers that I did get of them of the purchases of pipe back of 1901 I don't think one is purchased from R. D. Wood & Co. And in one of them showing pipe as light as 4 inches, I entered it in my exhibit, but on the contrary for other sizes they show even lighter. The idea is this the weights of different sizes run together.

At this point the referee admonished the witness to eliminate unnecessary discussion and answer the questions.

(Witness continuing:) I have shown here the weights for the 6 inch pipe based upon these vouchers running back to 1901. The average weight for the 6 inch pipe was 31.4 pounds, but the average I mean the average of the purchases on which I could determine the weight, it is four purchases here. I took the average on all I had data to get the average with. I intended to add the weights
1540 of all the purchases I could together, and all the lengths and divide the total weight by the total length so you would get an absolute average of the total amount of the pipe. That average was 31.4 pounds and the average I took was 30 pounds. I haven't a transaction on 10 inch pipe in 1910 which I got from the company's records; which weight is more than I assigned for the 10 inch pipe. I got a voucher for 12 inch pipe and found the weight 70.4 pounds, and I assigned 70 pounds or .4 of a pound less. Asked whether in all the pipe where I found vouchers showing the weight if the pipe as shown by the vouchers weighed more per foot than I assigned in my report of the weight per foot,—I say that isn't true, all the records I found was 396 feet of 16 inch pipe; I found that in the ledger; the company had no voucher at all for that. The ledger the weight — 37130 pounds. Outside of that one purchase in 1892 of

16 inch pipe all of the rest of the pipe is shown on vouchers of the company and by trifling amounts weight more per foot than the amount I say this company has in its distribution system per foot, I am speaking on the average; I don't say the company's hasn't any pipe heavier but I think that is a fair average to allow them. The fact that the company has 4 inch pipe in its store which weighs more per foot than 17 pounds, influenced me in determining whether 17 pounds was the right weight, because if they are using heavier now than before that raises the average; I think the company is laying heavier pipe than it used to. The weight of the pipe is not so much as the cost, in exceptional matters it is only important as going to the cost of the pipe. It would affect the life of it a little whether it was 17 pounds or 19 pounds to the foot but I should not change on that basis; my knowledge isn't accurate enought so that I could give
1541 the different life for 17 pounds or 19 pound pipe. The weight has something to do with the cost of pipe, it figures through into the cost because the pipe is sold at so much per ton. A ton is 2,000 pounds it used to be 2,240 pounds, now it is commonly 2,000 pounds but in older years it was sold at the longer tonnage. The price per ton of the 3 inch cast iron pipe I used $30.00. And for the 4 inch I used $28.00 as against $32.00 used by Mr. Lea; for the 6 inch and larger I used $26.00 as against $31.00 by Mr. Lea and for the 8 inch I used $26.00 and like on all the larger sizes I used it all at $26.00. I say there may be $2.00 difference a ton between the 3 and 4 inch cast iron pipe, I have seen them sold at the same price per ton, the practise differs in that there was only a little 3 inch and I allowed a good big price for it not because it was a small amount did I think it would affect the material result, that isn't it; it is a fact that the 3 inch size is very little used, is more difficult to get car load prices on it you can rely on for 3 inch pipe unless you are taking an absolute bid; I haven't as many prices on the 3 inch as on the larger size. Whether the price of pipe per ton in 1902 was more than in 1912, I can't say that without looking up my records. I have one purchase of pipe in 1902, that wouldn't necessarily represent the whole year, but taking that one purchase in June it shows the price of $33.60 per ton. I wouldn't take that as about what the company would have to pay for pipe in 1902 in large quantities. All I took it for is that the company had some pipe that they did buy in June of that year for $33.60 per ton, for that pipe in my estimate I allowed $28.00.

In 1903 as shown by the records of the company I have just one record given on March 26, 1903 where they bought 4 inch pipe at $36.60, that is all I got for the year; for the purchase of that pipe I have allowed the company $28.00 per ton, notwithstanding the fact
1542 that they paid $36.60 per ton for that pipe back in 1903; I am not valuing the property as of 1903. In 1905 I find the company purchased as shown by my exhibit "212" 4 inch pipe at $30.60 per ton on one purchase that I have, and I allowed as of January 1, 1913 for the purchase of that pipe $28.00 per ton, notwithstanding that the company paid $30.60 for it as of that date in 1905 in 1913 I allowed $28.00.

In 1906 I have three purchases of 6 inch pipe showing $32.35 per ton for a small amount, and as against that I think my allowance was $26.00; I am estimating the cost of reproducing such pipe January 1, 1913. Asked in estimating the cost of reproducing such pipe as of January 1, 1913 why I don't take the bill of the company for purchase of pipe under date of January 17, 1913,—I will say in the first place I have no knowledge of the time I ever saw that bill, in the second place I should not consider that one transaction a criterion to go by in the purpose of enough pipe to replace this great gas system. Whether I find there a purchase of more than $1,000.00 worth of pipe under January 17, 1913, I didn't see the date of the second voucher I assumed they are the same date, they are the same price per ton and the two amount to figures just over 1,000. I absolutely do not think that the purchase of $1,000.00 worth of pipe January 17, 1913 would be a fair criterion of what that would cost when bought in quantities necessary to reproduce this system. Mr. Lea estimated the value of 4 inch pipe at $32.00 and this bill shows that 4 inch pipe cost $31.55 January 17, 1913, I just testified to that. In this cost of $30.00 $28.00 and $26.00 per ton for this pipe I figured for drayage or storage down at the company's work or at the station; that would include switching charges because I think the company from whom you purchase will set the pipe at the gas works, any pipe in large quantities; ordinarily purchases f. o. b. Lincoln wouldn't include switching charges, it would be in the yards of the
1543 railroad company. For these costs that I give about pipe I assume that I am going to build a plant within one year and buy all of this pipe for its construction in a period of one year; it is under those conditions that I put the value on this pipe at $30.00,—$28.00—and $26.00 per ton. And in the digging of the trenches, whether I assumed that the work is to go ahead as one piece of work it is reasonable to say that you would go ahead as fast as you can with all the force at your command desirable to have to carry it along to completion. But a substantial percentage I think in a situation of that kind you can do the work a little more cheaply than you could do as the company is required to do. Commonly called the valuation I am seeking to get at by my method of computation is the reproduction cost of this plant, by that I mean the building of a plant like this one. That is by taking it all as one job you could get your materials cheaper, do the work cheaper and build it cheaper than the company built it in the course of its business. And the whole proposition of that is to get the one item of reproduction cost so called. That is not the value you expect to get of the matter of determining what the company should be entitled to here in the way of return these things all being old have shrunk some. I think the per cent value of this property is the value that must be determined for the purpose of fixing the rate, that is one way of getting at it but not necessary, it is one of the elements that the court will necessarily need. The evidence of the reproduction cost is only offe-d by me as just a step in the direction of guiding the court as to what the present value of the plant would be; that is all it is. I deny the proposition that the per cent value of this plant is more than the reproduction

cost because the plant can be built as one contract and the supplies purchased as one purchase. If I were to answer this I will
1544 say that I am not supposing necessarily that you let your entire contract of buildings and mains and works to the same party, I merely say that you can go about the matter at the same time and carry it ahead; I understand the company's original works to have been built in just that way. This is a small works, and I think you can go right ahead. Whether I would assume that the present value is what you could reproduce that for under one contract, I would say you might let it under a half a dozen, I didn't limit the mains to one party. If the company was required to pay $31.55 for gas pipe as per this voucher under date of January 17, 1913 I say it is not of that value for a rate making case, because you could buy a large amount of pipe at a less cost than $31.55 hence in valuing that pipe it is certainly not worth $31.55 notwithstanding they paid that for it. That is my idea of value for rate making purposes, or for purposes of a transfer here of this property to sell, nobody would give the company that, and that isn't this property based on that price per ton for pipe.

Joining materials, incidentals and specials in addition to the pipe for the laying of these mains which enter into the construction of the 4 inch gas mains. Under the heading of specials I have included the drips, valves although that might be questionable on a strict construction of the language whether the term specials might include it, that is what I mean to include, the special pieces of cast iron. All of the regular specials, drips and valves would be included under the heading I denominated as specials. The regular specials are quite a number known as crosses, T's, L's and reducers. Reducers are special castings for mains, by which you change from one size of pipe to another, then the drip pots are not uniformly included under the term of specials. The valves I include in the specials are the valves of the gas system, used to shut off one part of the system from another, the large valves of the mains at different points,
1545 there are a few in gas mains, and a good many more in water mains. The T's and L's are used where there would be a change in direction or the crossing of pipe,—suppose you are running out O Street and want to run out 14th Street,—you would put in a cross. On the small 2 inch steel or wrought iron mains you use some specials; they are in some cases where you run off a service, you generally get a special when you run off the lead gas mains; you commonly tap your service right into the main. My specials only refer to specials in connection with the main, the estimate does not refer to any pieces of material used in the service pipe, that is covered in the service pipe *ti* includes the specials connected with the service where you have a 2 inch wrought iron pipe, it is intended to include too that to be cut into the main system itself. In addition to those specials referred to I also include under the same heading drip pots and valves and have added to what would ordinarily be required as specials and valves at least the drip pots, I think they can fairly go under the heading of specials. Drip pots are for the purpose of getting the condensation out of the system, various vapors are

condensed into liquids and they will give trouble and stop up the mains and you have to have drop pots to catch that. There is no uniform rule of determinging by the number of miles of mains per drip pots. You determine the number of drip pots by getting a record of what it has been in a system, by making a fair estimate based on other systems. The companies commonly keep a record of drip pots and their location. I haven't seen the record of this company, it seems to me there is a reference to it in Mr. Lea's testimony that he stated he got it from some record. I didn't assume a specific number from Mr. Lea's report to be in the system, I added a percentage which I thought was a sufficient number. As to how frequently in
the course of construction of a mile of mains a drip pot would
1546 be necessary, that all depends on the changes in the elevation of the pipe profile, you want all your gas pipe to slant one way or the other towards the drip pot so you may have you- condensation run towards the drip pot; you want your main to lay flat or sag down to a low point unless you put it at the point, I can't give any uniform rule, I don't think there is any. There couldn't be any such rule, you would have to take the local conditions whether it is a flat or hilly town. I don't think there is a rule as to how far ordinarily they could go without putting in drop pots, if there is I don't know it. There isn't any such thing as the smallest per cent of pipe that you could use, you might adopt some small percentage of grade, but you couldn't lay down any fas- rule. It is not absolutely necessary to be on some grade, you might lay the pipe on the level, but the moment your liquid begins to accumulate you would have to make a fall towards a drip pot one way or the other. That wouldn't be desirable nor it wouldn't be the best construction. I don't think there is any regular practise in the grading per length of pipe. I don't know that it is 3/16 of an inch drop in a length of 12 foot pipe, it might be that in a good many cases. I don't think there is any hard and fast rule about it. To assume that the engineers for the gas company had determined that the minimum of 3/16 of an inch in a distance of 12 feet where you could have to put in a drip pot in that main, you would reach a point where you are getting too deep in the ground, so you would put in a drip pot to bring up your pipe and start on an upward run or you would be getting too deep in the ground. I think you could go more than a block in actual practice without putting in a drip pot. I don't know how far you could go on 3/16 of an inch, counsel said that I didn't. There are
differences in the character and construction of these drip
1547 pots, you may have a regular cast iron pipe or have a little pipe siphon. I don't know where the drip pots are located in this system. I didn't know that there was a pipe running out from the mains to the curb and the drip pot is below the curb with a pipe leading up. If that was the situation that might be a slightly different item of cost than on some other plants, but it would be a very minuet item compared with the entire cost of the pipe itself. It would involve the construction of a pipe from the main to the curb and an excavation for the drip pot and a pipe from the drip pot to the curb and a casing for that and a cover I should think. Where

drip pots are in connection with a main in the street the means employed to get to the drip pot is to have a pipe from the drip pot covered up so they can unscrew it out in the street with a casing leading down to it. I have just testified that I hadn't in mind whether those casings are used in the street over the main or over the curb, but the 3% for specials allowed is ample to cover their cost in either event, that is 3% of the weight of the cast iron pipe. These pots regularly are somewhat greater in diameter than the main, in the shape of a cast iron pot; as to how much they will hold in gallons I should have to look that up, that would enter into the percentage of the specials but the point is I know about what percentage these specials amount to. My putting it in as 3% and Mr. Lea as 4½% for specials whether I think I should increase my percentage,—I should say where a thing is a matter of estimate and not a matter of actual enumeration it is impossible to estimate it as to minute amounts, but the value is so small that any variation though very slight runs into dollars; I wouldn't want to be so egotistical as to say my estimat- covered the precise amount, I think it is a fair estimate, but not as accurate as if any size, number and location was scheduled out, some statements are less, but I think that is a fair estimate. I
1548 have used sometimes 3% and sometimes 4% I have never used more than that and I think I have never used less than 3%. If anybody convinced me that it would be 4% I should not quarrel with them, it wouldn't make but a small difference in the valuation. These specials are sold by the pound, in general cost just about double what the pipe cost. In fixing the percentage of specials I did not take that into account in the cost of the pipe; I figured up these specials on other systems bought as to the relative weight and relative cost of pipe; and relative weight will be always about half as much as the cost because they cost twice as much a pound. When I took $30.00 a ton for pipe that covers nothing but the bare length of pipe, and I took 3% and added it to the pipe for specials, the $30.00 don't cover the specials, drips and valves. Being asked whether 3% of the bar cost of that pipe did not represent the cost of the specials because they cost more per pound than the pipe,—I will admit the statement that they cost double but don't admit the conclusion that 3% don't cover it. I finally got the cost per foot of pipe and specials by adding 3% of the cost of the pipe to the other costs, I think that 3% of the cost of the pipe would include the cost of the specials. I didn't say that 3% of the weight of the pipe is represented in specials; I said the percentage of the weight would be about only half the percentage of the cost, it wouldn't weigh that if the valves were included as I have don- here. In addition to the specials I add the joining materials, incidental materials, and a little fuel for hot lead that you occasionally put in a joint, that is here in exhibit "238". That is for the materials delivered here, I do not add anything for storage as a segregated item, I have given what I think would be the cost of the materials and the drips. I meant that $28.00 for the 4 inch pipe in connection with the cost of delivery I allowed would be the cost at the trench. I allowed nothing
1549 specifically for storage. My allowance per ton or per foot for hauling the pipe and specials to the trenches is not segre-

gated for the hauling apart from the other labor it is in that item of carting and laying which on the 4 inch pipe amounts to 3.4 cents per foot. The hauling of the pipe and specials out to the trench is in one item and is so shown here in my estimate; I didn't make any separate item of the hauling. I don't know whether I ascertained from the water department what it cost per ton of pipe to haul it from the point where delivered on the cars to the trench, if I did it was certainly after I made this estimate; I don't know that I did. I have in mind various figures of what it cost to haul the pipe from the station to a point where it was delivered to the trench, you take 50 cents a ton is a very good figure on a good big job, sometimes they haul it for less and sometimes more than that; 50 cents a ton on big jobs and on always up to a mile or so. Taking the ordinary job such as take place here and the ordinary hauling I think 50 cents a ton here for this work taken as a whole as one job the contract to haul all this pipe and specials. I would not say if the city in hauling its water pipe paid about $1.00 per ton for hauling it to the trenches was a fair estimate of the cost of gas pipe unless they paid it for the construction of a large main system like the gas pipe system here; if they paid that on the ordinary laying of pipe from year to year that wouldn't be a fair criterion, if they paid it on a few jobs it would be worse. It would cost considerably more if the pipe was hauled at different times than if it was *than if it was* hauled as one job, the hauling of a pile of pipe, it is greater if it was hauled piece meal than if the man made a contract to haul pipe, or if the party putting in the pipe by the day made an arrangement
1550 to haul that much pipe in the course of the pipe season. I don't think it would be fair to allow the company what it cost because it hauled it out in small lots, because it isn't my idea of a reconstruction cost.

I don't pretend to decide between the two propositions. One made up of the investment cost less depreciation, the other taking what it would cost now to reproduce the whole thing less depreciation, it may be that is the proper basis, but it isn't for me to decide. I am asked to give one price and I have given it. I haven't given what it cost to have this work done, that comes in an analysis of the compan-s construction account. I don't segregate the item of the hauling, I include that with laying the pipe. I can't tell, I never have apportioned to the laying of the pipe, I could make up a detail having that apportioned to one or the other. I could arrive at the total in one way by giving the cost of doing that work in a lot of other jobs that I thought was similar; jobs that I watched to a greater or less extent and annalized the case and doing it like this case here in Lincoln. I claim to have something in the way of records that show the cost of carting and laying pipe per foot under the classifications I have here, it shows that in connection with other cases of carting laying and the entire labor connected with the job. Carting as a separate item isn't in the company's gas reports, I have forgotten whether it is in the main work orders or not, if it is I haven't cast it up and segregated it; I have taken the entire labor cost which I presented. I did not base my carting

and laying upon the company's record of what the cost was per — only in the sense that I have compared and checked it up with the company's cost, that being somewhat greater than I have allowed; I don't think the cost on a wholesale construction should have to be the same as on piecemeal. On some of those I thought you should not be allowed what it actually cost the company, on other
1551 things that have appreciated the company ought to be allowed what they are now worth, either taking all things at what they did cost I *and* deduct*ing* the depreciation or taking all things at what they would cost now and deducting the depreciation.

When I take all things that have cost as of January first 1913 I wouldn't object to taking what the pipe cost on that date in the quantities required I am not going to take piecemeal quantities or $1000.00 worth of pipe. I haven't taken quite the same equipment the company has if I were going to estimate on the reproduction of the plant and located in the same place it is and determine the cost of reproduction. I varied some in the matter of the holders, I got at the value of the company's holders by seeing what a fellow would have to pay for a more modern type of holder, but in the main I have taken the equipment the company has now and measured the new cost of the equipment with it in order to get at the value it has now, in a few instances I valued it by considering what a different thing of equivalent capacity and efficiency would cost. Whether the reproduction of property means the reproduction of the same property, I would say that I am arriving at and stating to the court for its benefit what I think the value of this property is now. This thing called reproduction is but a step in arriving at the value of an antiquated piece of machinery I don't think you are obliged to reject, or allow you to assume that anybody now would be so foolish if he wanted such a thing, as to have to have an antiquated piece of machinery or structure reproduced in kind, he would get something for his use and purpose that was its equivalent. That antiquated machinery wouldn't help out any on the reproduction of the mains, I haven't assumed that of the mains.
I assumed and have taken the cost of what I believed to
1552 be such mains as the company has on the average; I think its weight of pipe varies, and I have struck on what I think would be a fair weight. In determining the reproduction cost of mains I would figure on what it cost to buy the pipe now at wholesale. I wouldn't necessarily put it where it is now. The view I take of the main situation, is that some of the company's mains lay where well-advised persons wouldn't lay them, they wouldn't dig through all of that pavement where they could dig through soft soil, and I have done for a means of arriving at the value what a person would give for it who would like to lay some of these in different places from where they are now. I say that is the reproduction of mains, of similar capacity or adapted to perform the same work. I don't say that the mains are in the same place, I specifically advised that I would put them somewhere else; and think that as a matter of reason, you are too reason that it would be placed somewhere else;. The value of the thing that exists, where

it is, takes into account what could be done to get something else to do the same work. I am trying to arrive at the value, and value means what someone may give for it or an equivalent thing to do the same work.

1553 It is an absurd question to state that if the gas company was engaged simply in furnishing light for illuminating purposes and I was trying to get its equivalent and could get it through the construction of an electric light plant that I would construct that and offer it as a substitute for the gas plant,—I would not try to substitute an electric plant as an equivalent for gas for use.

I included something in the labor item of laying the pipe per foot for calking but I haven't segregated that. I put down the labor and material cost of pipe per foot and I could segregate it by reference to my data into the different items of laying the pipe, carting, putting in cement and lead to make joints, etc., but I haven't it here now, I consider it entirely unnecessary to make any such segregation. I have seen such samples of segregation, and have made them myself. Whether there is any fixed rule by which they set apart any fixed amount per foot for laying and carting pipe,—I should not think any well-advised engineer would set pipe that way, you couldn't lay 16-inch pipe for the same amount as 4-inch.

As to what amount I figured per foot in Haverhill for the 4-inch pipe I have that figure at the hotel and will have to bring it in the morning. The cost per foot ordinarily increases as the size of the pipe increases, sometimes I have added some small cost per foot to make it uniform, like I have know- specials to be estimated per foot; it is a rule of thumb, it isn't accurate; it may be accurate enough for total but not for pipe of different sizes. A part of my joining materials and incidentals the cost per foot for them I cover in miscellaneous items, in joining materials you have a little lead and considerable hemp and considerable cement, and in addition to that a few additional materials, such as fuel, little pieces of lumber for soft places in the ground that may be needed.

1554 I based my estimate upon what I have found these mains cost in different places, that aided by such an*n*alysis as I am able to make of those costs. I haven't the lead and hemp items separate from other things, I figured most of those pipes laid with cement joints; by taking ½ cent a foot from the figure I here show for joining materials and incidentals you will have remaining my figure for lead, hemp and cement. The total figure for joining materials for 4-inch pipe is .88 cents per foot and taking out ½ cent it leaves .38 cents per foot for the cost of hemp and cement you would use in making joints, plus a small percentage of joints which I figured would be laid with lead, it is sometimes desirable at intervals to put in a lead joint. I haven't separated here the amount for lead joints as to cost and labor, I don't think on the whole this system has lead joints, it is largely laid with cement joints. Concerning the source of my information that this system was largely laid with cement joints, I made some inquiry and found that they were laid largely with cement and I thought that

was a fair assumption that it was laid with some amount of lead and a reasonable amount of cement. I don't recall whether I made any inquiry of the gas company whether these joints were lead or cement. The gas company's officials haven't shown any disposition in this case to give me any information as to the facts. Concerning whether it is a fact that these joints were practically all lead throughout the system,—I would say it would be an unfortunate thing that the gas company would get a costly thing where a less costly would do just as well. I regard cement joints cheaper and just as good and because generally used in gas business. I assume they are generally used here. It has been my experience in the operation of gas plants that they are generally used; I don't mean to exclude all lead joints, I allowed for a fraction here being laid with lead joints my experience is that a greater number of
1555 cement joints are used instead of lead joints.

In the matter of services if I am right in my computation my valuation includes 8546 services laid from the main to the meter, and 124 stub services. I have now forgotten whether I got the number 8546 services from Mr. Lea, or from the company's reports on the number of services laid year by year, I certainly got some from the gas reports but I have made an allowance in the first year,—1902,—for the additional services claimed by the company's testimony, if not I would have to look that up. Mr. Lea has 8201 as against my 8546 services that would look as though I went by the gas reports as I understood them to be; I have 124 stub services as against 114 by Mr. Lea and it would be my opinion that I got this data from the company's records; I know I got the services laid year by year and as to the total number if it doesn't agree with his number I think probably I got them from the company's records.

I think I have a computation in my valuation showing the number of house services under paving and the number which are not under paving; I haven't that here but I have set down here as the services under paving that is, to be laid under paving in the event of building a plant like this one 3550, that is a mere estimate. I haven't determined from the records of the company just the number of house services under paving. Assuming that Mr. Lea shows in his report 3069 house services under paving and my estimate is based on 3550 and assuming Mr. Lea shows 114 stub services under paving would make 3183 house and stub services under paving as per Mr. Lea as against which I estimate 3550, mine is an estimate assuming the service to be pro rata distributed along the main.

The net construction cost of services laid in unpaved streets as shown by myself is $69,453.00 for house services and $486.00 for stub services, making a total of $69,939.00. I haven't Mr.
1556 Lea's figures before me but possibly the item of $111,689.00 is his item for house services and stub services in unpaved streets. Mr. Lea's report and my valuation appears to be the same namely, $486.00 for stub services; I didn't take his valuation but reached the same valuation, the way my valuation on stub services shows in exhibits "247" and "248" where I give the items. There may be a difference of at least $42,000, practically in the item of

house services and stub services between Mr. Lea's valuation and my valuation but I haven't his figures before me.

With respect to the house services I assume the length of the average service was 50 feet and very likely Mr. Lea assumed the length of the average service to be 73 feet and I think the difference between 73 and 50 feet very largely accounts for the difference in valuation between Mr. Lea and myself on that item, I think that is a very large part of that item. I got my data — which I based my assumption that the house service- were of the average length of 50 feet by considering the width of the city streets in Lincoln, on consideration of that width I concluded that 50 feet was a fair average figure to take for the part of the service that lies between the main and the property line, and then in connection with that I notice in the company's gas reports it appears to be charging the consumers for a large portion of the service pipe on the average, and I concluded it was fair to allow the company for the part that lies in the public streets. That is the only part I intended to allow the company for in arriving at my 50 feet, I thought that was fully enough*t* and I assumed the company owned 50 feet. I assumed that the average width of the streets from lot line to lot line is not to exceed 100 feet on the average, I assume that taking all of the company's services in the city. I didn't assume that the width of the average street from lot line to lot line in this city was
1557 100 feet. I deny that if the average width of the streets in the city were 120 feet from lot line to lot line that that portion of house services that lie in the street would average 60 feet. I would have to know that the company's services were pro rata in the streets of this width and that the services are equally distributed between the wide and narrow streets. As to how I determined upon that 50 feet would be the average service, I determined that by learning the fact that some of the streets are substantially less than 100 feet, some over run it, and some are 100 feet and I thought on the whole that 50 feet for the service pipe was a fair average to assume for the portion of the pipe laying in the public streets.

Concerning whether the records of the company show that for many years the services from the main to the meter was paid for by the company,—I will say that I think the records show a great variation. Some years the company pays for most of the cost of the service. In other years the greater portion of that cost being charged against the property owners. I don't think that the records do show that for many years this company paid the entire expense for that service from the main to the meter. I think the rule was that for many years the consumer had to pay it; I learned that in some years the company did pay for the greater part of the service. I took into account what the company had paid on these services during the time it paid the expense from the main to the meter, but I couldn't base a mathematical computation on it. This record about the cost of services only runs back to 1903. On the question of the length I took into account I thought as near as I could make up my mind from the fragmentary and partial extent of the
1558 records on that point, that by allowing 100 feet as the average width of street, that would be giving the company all that

was coming to them if it was assumed that they paid for all the services in the public streets. I don't think they paid for all the services in the public streets at all times. I think the record was that the consumer paid for a portion of the service beyond his lot line. I have this computation here in exhibits "206" and "207" showing the cost and amounts paid by consumers in total beginning with 1903 and ending with 1912 which I took out of the company's gas reports. Exhibit "206" or "207" shows a less cost per service paid by the company than the amount I have allowed for in the services for 50 feet that I have allowed them for. In exhibit "207" I have compared from the records of the company the total cost of the service pipe since 1903. As to the number of house services for years prior to 1903 I concluded that 2911 was the proper number to use prior to 1903 that added to what was put in since and including 1903 would be the total I have allowed, except there might have been some discontinuances, something of that kind, it would approximate that. In 1903 the number I used was 2911. I haven't assembled any data with respect to those house service-, I think there is some statement in the company's corporate records about that, but I haven't been able to assemble any data. For the year 1903 my exhibit "207" shows the total cost of services to be $9060.73 and of that amount the consumer was charged with $81.23 for 1904, and I think this shows all services house and stub, it is headed total cost services, for 1904 this item was $7,956.36; and for
1559 that year $81.91 out of that amount was paid by the consumer; 1905 the total cost of services was $8,528.05; and of that amount $490.75 was paid by the consumer. Whether for those three years that is a fair indication that the company was paying for the cost of construction of house services,—I would say in those year- that was the great bulk of them, services of all kinds. That wouldn't indicate in face of some of the entries of the corporate records, that for 1902 probably the same proportion of the total cost of services was borne by the company as shown in 1903. The information was not available to my so that I could have compiled it back of the year 1903 just as well as for 1903, that is the extent of the information I had of the cost of the services, else I would have gone right back with it.

In the matter of placing the mains out in the park way in order to reduce the reproduction cost I don't think I would experience any difficulty in these house services in such construction, I thought that over and I didn't see any difficulty about it. Whether I said 41% of the mains are under paved streets I haven't purported to change part of the services under paving, exhibit "243" shows that. I haven't assumed to change the percentage of services that lie under paving at all, it is only the percentages of the mains. In the reproduction of this property at the cost I have indicated 20% of the 1¼, 2 and 3 inch mains and 32½% of the 4 inch mains I have assumed as the percentage of the total mains now under paving that would have to be put under paving if you were going to reconstruct another plant.

The statement is wrong in saying that I would put 80% of the

4, 3, 2 and 1¼ inch mains now under paving out in the park way. I wouldn't necessarily put them all in the park way. I have information that I am going to introduce to the effect that there is a very large amount of unpaved *allies* parallel with paved
1560 streets and I still reserve the choice to use the *allies* or park way. I wouldn't necessarily reproduce these mains in the streets where they are now. I wouldn't necessarily take them out from where they are now simply to avoid the expense of paving, there is no particular reason for laying them where they are now, in a great many cases the paving is a narrow strip 30 feet wide in the midst of a 100 foot street with more than 30 feet on either side, that strip varies. Whether the principle reason for wanting to take it out from under paving is to avoid the cost of paving,—I would say there is no particular reason for laying it in any particular place, and where it is a costly thing lookin*t* at it from the standpoint of cost and value, I would take the cheaper place to put it, and I picked out the park way and the *allies*. I have decided definitely about the *allies*, I hadn't been able to get the length but I have it now, I had my eye on the *allies* ever since I have been looking around the city.

Whether in distributing this 80% of the 1½, 2 and 3 inch mains and the 67½% of the 4 inch mains in some other place than now to avoid the cost of paving I would go back of the *the* curb line into the park way,—I would just take it to the curb line, the actual location you would occupy would vary some with the location of the trees, if I went into the park way at all, I might lay to some extent in the all*ies*. On some of the park ways in the streets of Lincoln there are a great many trees and shrubbery. Escaping gas from gas mains is kind of hurtful to the trees. I had heard in a general way that the company had paid some damages to somebody caused by the escaping gas from gas mains killing trees, but I haven't followed that up or made any compilation of it. I would think if the work was properly done there might be a little additional risk assumed by moving the gas mains back from the streets. In the construction I am not
1561 figuring on putting in more than one gas main in the streets where you move the gas mains back into the park way; I don't find two gas mains in a street very much there is only one service needed to put these under paving. Whether I would experience any difficulty, if I moved the mains back into the park way, in carrying the service across under the paved street to bring it on the other side to put it into a house for service.—I thought some of that problem before I suggested the location, and the reason of that was I thought there might be some difficulty in choosing a new location I had to think of those problem- that might be involved but I have concluded it would work out. In many cases the park ways are not graded to the level of the pavement; in many cases that portion of the street which lies between the curb and the lot line is several feet higher than the paved street. You have to *to* go deep enough in the park way to get below the pavement with your gas mains but I don't agree with the statement that you would have to sink your gas main 4 feet in the park way before you got to the top of the pave-

ment, unless you had a park way that came up like a vertical wall, which you haven't got here, it slopes gradually from the curb and that would allow the main just inside of the curb, that is where your 4 feet goes. If you run your main from the service to the curb the proposition is you would slope your service from the main up to the premises, to each consumer just as you do now. Asked whether he would slope it from the main to the curb to get under the paving,—I would say no, you would slope it all the way from the main to the house on either side of the street. In such construction whether you brought the gas main down to the bottom of the pavement on either side of the street. Asked if you would have to cross under that pavement on a level I say no, I would cross with a rise towards the
1562 service of the house to which it was going. I figured on having the main low enough so that the service can slope upward from the main to the houses on both sides but that don't involve putting it any deeper in the ground than now. I didn't figure out what grade or slope I would be justified in carrying a service across the street, say from the east side to the west side of the street, assuming that the street runs north and south; I should more conveniently allow several inches of a drop of the service under the paving which is only about 30 feet wide. As to how far it would be from the main to where the service would enter the house on the opposite side of the street,—if you take a 100 foot street and lay your main just inside of the street on one side is run to the house on the other side you would have 60 odd feet to get to the lot line and then you would have whatever distance the basement of the building was inside of the lot line, in addition to that 60 odd feet, you would have a very long service on one side and a very short service on the other side but the average service would not be changed any. Whether I know of any gas plant where such an attempt at construction has been made, I understand that a few of this company's mains here are in the park way, more than 10 miles of the water mains are there, I put in an exhibit showing a good many miles of water mains. I understand it is in the company's testimony and from some of its maps that the company has a few gas mains in the park way now. I don't understand that the company put in two mains, one on each side of the street. I don't think it would have to. What the company may have done I don't know, but I don't think that is necessary at all. I think this extra depth for the cross mains is imaginative. Asked if the park way was 5 feet above the pavement whether the extra depth is all imaginative when we talk about a main 5 feet deep,—I take it that the park ways in the great majority of instances slopes gradually up from the curb. If counsel says they don't you have lived
1563 longer here in Lincoln than I have, but where they don't slope up gradually I would say that isn't a good place to lay your mains in the park way.

Asked to draw a diagram showing just how I would put the mains back in the park and extend the service across the street under the paving and construct a service into the house on the opposite side of the street,—I would say that I am not going to draw anything to be reproduced; I don't care to make a drawing and wouldn't do it in

the record unless I have a chance to make it properly. The statement that where you have taken a main out from under the pavement and put it back in the park way, whether I understand that in all such cases the park way is above the top of the pavement,—I deny that, it is above the side but not at the center, the center of the pavement is about on the line with the top of the curb or park way, substantially on a level with the top of the curb. (Witness here produces a paper) That represents in a rough way the situation as to the cross section of the street, I am not a very skillful draftsman, I have exaggerated the relative width of the pavement, ordinarily it is only ⅓ the width of the street it is supposed to have it cut right down through the street. In the diagram I have drawn I have assumed that the park way is level with the top of the curb. My attention being called to exhibit "260", I notice that it is substantially the same level right next to the curb, I should lay the main right below that in the park way inside the curb, the city has miles of water pipe laid in that same way. I would not lay it right up against the curb, but in a line substantially beneath it, the curb don't go down as far as it would go, it only goes down a little below the bottom of the pavement. My idea is right near the curb, near the vertical plane of the inside of the curb. I don't understand that if the city graded the portion of the park way and bring it down to grade that

1564 I would have the benefit of having that point graded, the park way is substantially the same level as the curb without any grading; the park way is the distance between the curb and lot line that is the place where the side walks are. In this city the park way or side walk space isn't brought to a level with the pavement, in the edge of it, but touching the curb is substantially the same level in most cases; there are a few cases where you have a vertical wall running up, I wouldn't put a main in there, but there is no such illustration as in that picture, there isn't more than 1/10 of foot difference in the level of the curb and the park way next to the curb, otherwise the earth would fall over into the street. By doing that I think I could get the proper level for the pipe across under the paving and get it out on the other side and into the house on the opposite side of the street I wouldn't suggest having any jog in the service pipe, I don't think it would be the sound and practicable way to do it, if I couldn't run my service across without putting in a drip pipe I wouldn't do it at all. You could run a service pipe that would carry an elbow in it where the ends were higher than the elbow where the elevation is up. You can run that service pipe all right. I don't see any necessity for making a joint like that with the end up to get a pocket, before you would have anything up in front of it, you can't get the liquid to stand in it if it slopes. But if it came down to the house on this side of the street (indicating) and across the street you would have to have a drip pot. You must have your gas main low enough here (indicating) so you can come across the street and have the pipe all the while slope towards the main. That is what I said at the very start, I didn't suggest anything that didn't involve a slop- of the service pipe towards the main. If the main isn't deep enough

in the ground to carry that pipe across into the paving with-
1565 out a slope up I wouldn't risk it, I would either dig the main deeper or wouldn't lay it in the park way. If I dug it deeper that would involve an additional expense. I would lay out a plan for the ditsribution system where I would have to have drip pots in the service but that is a different proposition putting drips in the large pipes used for mains,—as compared to putting them in the 1¼ inch pipe for service.

Being asked to give the cost I assigned to repaving over the mains that would be laid on the reproduction purpose and asked to assume that the net construction cost of the paving over wrought iron mains as shown by Mr. Lea's report is $57,448.00 and the net construtcion cost for paving over cast iron mains is $53,917.00 making a total of $111,365.00 that Mr. Lea figures as the cost of paving over mains. My net construction cost of the paving over all mains wrought and cast iron is $34,518.00 or a difference on the item of paving over mains of $76,847.00 assuming that counsel has correctly stated Mr. Lea's amount. I suggested the construction of a plant of the same capacity and size as this one but laying the same mains in the park way. And that by doing so I would save $76,847 assuming Mr. Lea's figures to be as stated; I assume that it would cost $34,508.00 to cut and relay the necessary amount of paving over mains that I would suggest as installing to take the place of the present mains. Mr. Lea's figure for paving may be somewhat greater than mine that ought to be allowed for whatever it is, I think I have guarded myself against that by assuming the cost of paving to be as represented by my cost of paving $34,508.00 if our unit cost per square yard were a little different that would make a difference. My unit cost per square foot is 25 cents for cutting the paving and putting it back; I took that as a figure to be applied to all kinds of paving indiscriminately. There is a little difference in the cost
1566 between opening asphalt paving between the cost of opening brick paving but I have taken 25 cents per square foot as a fair figure; I have a computation somewhere. I had access to the contract with the city in preparing that computation. 25 cents a square foot is $2.25 per square yard which is a price above a great deal of the prices paid for contract paving here, and I consider it a fair price to allow for this paving. I aim to get what would have to be paid in the case of the reproduction of a plant similar to this plant, just what the arrangement may be between the city and the paving company for cutting a little piece of paving here and there I haven't in mind; my 25 cents wasn't based on that but on the general paving per square yard in the city for a number of years. Whether I know I wouldn't be permitted to go on the paved streets and open them up without permission from the city, unquestionably the city has control over that. I am not sure that the city wouldn't permit,—where a contractor had put down the paving and guaranteed the life of it,—anyone else to open that up and replace it; at any rate I haven't been bound by any such regulations as that; I think it is open to me to assume fair conditions and in opening the paving that is what I have done.

So in my figures about the reproduction of these mains that the company if I didn't expect to reproduce these mains under the paving as they are now at the figures I suggested; that clearly appears, there is no mystery about my estimate.

To get the total cost to the owners of the property for putting the necessary length of mains as I compute under the paving I would take my $34,508.00 as the cost of the material and labor for the paving and add to that the 7%. The total of my $34,508.00 of cost plus 7% for engineering and other general expenses would amount to $36,913.00 I don't denominate that as the reproduction
1567 cost, I haven't used that expression. Assuming that the reproduction cost of the paving in Mr. Lea's report is $129,184.00 there would be a difference in that one item of paving of $92,271.00. Asked whether that same difference would be carried into the present value,—I would say I depreciate the cost of the paving at the same rate that I have the mains underneath, and when the main is gone the paving for the company's purpose and that value is gone.

There are two Haverhill cases, I used 4% for specials in estimating the cost of the cast iron gas mains in the later Haverhill case, I am not sure now and don't remember which figured I used in the earlier case. The one in which I valued the property as of January 1, 1913 I used 4% for specials, drips and valves. Whether I denominated the item "Pipe and 4% for specials" I don't remember the exact heading I can tell it in the morning as I have the schedule at my room, that was 4% on the cost of the pipe, instead of 3% I put on the plant here.

Without reference to the cost of service pipe here in the unpaved streets I have a tabulation showing the cost per service which is $8.13 for a 50 foot service for 1¼ inch pipe which I took to be a representative service. Whether Mr. Lea's figure was $13.56 on that item,—I don't know what his figure was.

Asked whether the cost of the 1¼ inch wrought iron pipe itself for which I gave the cost to be 13½ cents per foot for the 1¼ inch wrought iron pipe as against Mr. Lea's 18½ cents,—I will say I don't know what Mr. Lea's figure was; my figure for the pipe apart from some special fittings and meter cock is 14½ cents shown on exhibit "247", there is an additional charge of 50 cents besides the 13½ cents. I don't show on exhibit "247" the cost of the pipe alone: it says there 50 feet of 1¼ inch pipe laid at 13.5 cents and at
1568 a lower point in the column connected to the main 50 cents; I chose to separate my labor cost that wan and assign 50 cents for labor of connecting the pipe to the main. The 13½ cents contains a substantial amount of labor cost and the 50 cents is the additional labor charge in toto that is 1 cent per foot, in that 1 cents per foot I include the items of labor for connecting up the 50 feet of pipe, one street "T", two street elbows, one plug, and meter cock and the 50 cents for connecting that up and the labor portion of the 13½ cents. I put a portion of the labor in the 13½ cents and gave separate item in the 50 cents because I thought that was the right way; it is a little special job connecting a main to the pipe, it isn't

like laying so much pipe to get at it evenly in my own mind, I sometimes put it that way. If I was laying that 1¼ inch pipe as a main and not as a service pipe, a long length of it, that would be 13½ cents a foot. Under ordinary conditions if I was laying it as a service pipe I would add 50 cents with every 50 feet if I had to make a special connection to the main it would cost more for labor so really the basis I take is 13½ cents in position connected there to that stub.

In the stub service I get $3.92 per service, including the cost of the pipe and the cost of putting the pipe in the ground and connecting it up. Whether Mr. Lea's cost for that same pipe is $4.27,—I don't know what his figure is. In that case I have 23 feet as the length of the stub service. Assuming that Mr. Lea has 23 feet of pipe and on that pipe I get the difference of 35 cents I will say that if I am expected to answer the question I find my stub service estimated to cost $3.92 and counsel stated the stub service per Mr. Lea cost $4.27 on which the difference would be 35 cents.

I think I presented a tabulation showing the number of services in 1903 and the number of services added each year subse-
1569 quent to 1903 down to and including 1912; which data I got primarily from the gas reports of the company, with the aid of some assistance I figured it out myself.

From the same records I presented the number of meters in 1903 and then gave the meters each year up to and including 1912 which number I make 8326 meters. I got the figures for that tabulation out of the gas reports of the company. I don't think I included in my number of meters any meters that are in stock I think those 8326 meters were all in use. I think I only took into account the meters in use. In valuing the property to get the reproduction cost I don't think I included any meters in stock. I have before me my exhibit which shows the total cost of the meters and the tabulation of the cost of the three light ordinary meters. I did not give the cost of the meter itself at $4.50 because my exhibit does not show the individual meter reduced to its cost; I started with the list figured that way and then took my discount off; the list was $7.50 for the three light ordinary meters; I figured 40% discount which gave me $4.50 that was f. o. b. Chicago, I added $1.40 for freight, setting and connections. I don't remember what I ascertained the freight would be on the meters. I haven't with me the details to show how much of the $1.40 I included for connections, it is down to the room and I can bring it in the morning. I did have it before me when I made the computation. I made it up from the details and can bring the details I have. I can't state what I included in the $1.40 if anything, for the setting of the meters because I haven't the details here as stated, and as to testing of the meters and setting and for incidentals I can not now state how much of the $1.40 applies to those items. I haven't any details with reference to the freight, connections, setting, testing and incidentals in connection with meters. I have the cost of the meter here, the years that they would acquire in
1570 depreciation figured on those various details. Taking the meters all together I have estimated the cost of the labor and

1129

materials on the three light ordinary meter at $1.40 for the freight, setting, and connecting. Asked for the total cost of this one three light ordinary meter,—I can only get it by adding $1.40 which I have taken as the fair average to the amount of $4.50 which makes $5.90. I added $1.40 to cover all the cost of freight, connections, setting, testing and incidentals, I used that as a fair average figure to apply to all sizes, as a matter of fact the three light would cost less than 100 light, that is those incidentals.

Turning to the item for engineering, interest, etc., of 7% which is included in exhibit "231" which is the valuation of the Lincoln Gas Plant as of January 1, 1913, that item is on the page carrying the items of lands, works equipment and distribution system. I did not figure on the 7% as covering the interest charge during all of the period of construction because you have advantage of the ordinary credits, but during the construction period you wouldn't have the advantage of the credits on each particular part of the plant. I don't mean to say that you are going to have interest for the entire fraction of a year the plant was building on everything, but you are going to have interest on some things a longer time and some things a shorter time and for whatever that is I have included 7%. I do not assume that if it would take one year to build the plant the interest should be computed on the amount it would cost for operating half of that time, nothing like that at all as to what portion of the time and about what portion of the total investment I did figure this interest on, I should get it by figuring the percentage of interest on the whole investment, it might be ½ of one per cent. It don't make any difference about the period
1571 of time for the year if you get the investment and the percentage you can call it one year or ten. I reduce the time by reducing the item of interest, that is I cover the time by fixing the ½ of one per cent; I am not giving that as a hard and fast rule, but that would be an approximate figure for it, taking the total cost of the plant; I computed ½ of 1% for interest and considered that about sufficient to cover the item of interest, it might be as great as ¾ and it might fall below ½, but somewhere in there would be about right. I do not include the balance of that item in engineering expenses. As to what other things, enter into that item besides interest and engineering I would say some little incidental travel/ing expenses, little incidental office expenses and a little taxes, they would catch the company with a little taxes on this property if they were lucky. You would have to pay some taxes, but part of the taxes you would pay would go into operating expenses; you would get the plant started long before the close of the year and a part of the taxes would be in the operating expenses, but you couldn't capitalize all of them. Outside of the taxes and traveling expenses for the men building the plant and everybody connected with it ordinarily the engineer, possibly some other persons would be included, or some of his deputies. I didn't figure exactly how long the engineer would be expected to be in the service of this plant; it depends on how many other jobs he had to get his plans and specifications all made and arrangements completed to begin work.

POOR COPY

I wouldn't get a substantial sum unless I did quite a chore about it, more than I required in building the plant. It would not depend on the amount of other jobs I had but I would be about it from the time it began until it ended, I say the whole time, I would be about it just as the whole time I am about that Ypsilanti proposition, it depends on whatever jobs I have, you have to
1572 divide your time up as well as you can. I didn't fix on an absolute percentage for engineering expenses in connection with this plant, it would be somewhere between, 4 and 5% for the engineering and supervision of a plant of this size. I determined this amount of 7% partially from actual*ly* experience I have had in that work, also from the experience of other companies I know about. The companies I have in mind that I know about are some companies in Massachusetts and some elsewhere; I have in mind the water works plant at Milwaukee and some railroads here in Nebraska I don't remember the railroads in Nebraska, I haven't that folder here with that in, I can bring that in the morning and a number of gas plants. I have the data of several gas plants in Massachusetts about engineering charges. I learned something about the engineering charges allowed by the Commission of Wisconsin when in the Racine case and I have learned something since. I learned that the Wisconsin Commission used a 12% item for some additional things I haven't included. It seems to me they included in that 12% some things they called contingencies, one or two other matters, that is Mr. Pentzer's testimony anaalizing that before the Commission.

In this item of 7% I do not mean to cover the item that Mr. Lea covered in his item of 16% under the heading of engineering, etc., including engineering and supervision 6%; casualty liability 2%; taxes and loss of interest during construction 4%; omissions and contingencies 4%; total 16%. There are some of those subdivisions in Mr. Lea's tabulation that I omitted from this 7% namely, omissions and contingencies and the rest so far as they are to be included I included them in so far as they are an actual expense; I have taken anything into account in my 7% that I think would be incurred under other heads in my valuation I have allowed for omissions and contingencies all through my tabulation but not as a
1573 separate item. To take care of the omissions and contingencies in giveing the cost of these meters for instance, I made the item substantially large to cover all expenses I believed, for the installing of the meters. I neither added nor subtracted I made what I thought was the right price, and that is just what it would cost. I allowed for contingencies by allowing what I thought they would cost. There would be contingencies in there, I haven't a doubt but it would cost less on a good deal of this work.

It is something usual and ordinary in contracting work for engineers to figure up the total cost of the work as far as they can determine it and the- provide for an additional amount for contingencies and omissions; it may be sometimes done that way. I have allowed a price for this work it could be done for by contract right through, if the contractor wants to figure a part of his price

for contingencies that is immaterial, so in my mind I have allowed enough for this contract. I don't say that I have allowed 4% in the amount that affects the value, but I have allowed enough to cover any incidentals or contingencies, I didn't testify that would be 4%.

As to how much I figure of this 7$ for taxes,—that would be a small fraction of 1% it might be 1-10 or 2-10 that would fall on the property while it was out of use. 1-10 of 1% would be ample I think for that. I mean of course the kind of taxes that are really collected, the general property taxes; I omit any special occupation taxes.

As to when I would expect to commence the construction of this plant or the portions of the machinery I would say the construction of the machinery would be commenced at any convenient time of the year, I have in mind the first of January. I didn't make any computation definitely as to the amount of materials and
1574 appliances I would expect to have on hand by the first of May. Whether it would be necessary to do that when it takes 1-10 of 1% for taxes,—if I was fixing that as an absolutely fast sum to be arrived at by a certain mathematical computation I would say it would be necessary; but I don't think it would be necessary to carry it to that refinement. I simply think from some knowledge of the business and of taxes that 1-10 of 1% would be a plenty on the property to cover the taxes that would fall on the property out of use.

I would not necessarily expect to have all of the money here and available for the construction of that plant in the beginning. I haven't made any computation about raising the money, I assumed that the parties would have the money to build it with. It is very doubtful whether they would either have to pay the taxes on the money or the plant because you might have your money in New York getting interest on it. If I was here I would be expected to return the money here for taxation if I expected to build a plant here I would say I don't think so, you would have to pay interest on it in New York unless you could dodge it in some way, if they got you, and all of these ifs should come true I think 1/10 of 1% is sufficient for the property while it is out of use.

Assuming that all of the taxes of the property of the gas company if fairly and honestly returned here in Lincoln might be more than 1% if the company had it all here, the company wouldn't have it all here, during the year; a considerable part of the taxes would — on it wherever it was and would be applied as a separate expense, it wouldn't all by applied as a construction cost.

As to what information I have that justifies me in assuming that this plant could be built in one year I would say these contracts for gas machinery; and I put into an exhibit here the other
1575 day the length of mains laid by different companies in one year's time which contributed to that opinion. If I came here to build the plant as an engineer I would not necessarily expect I would have to get a franchise from the city, they might have one when I got here. I would not necessarily expect to organize a company, a private individual can engage in a public service business.

POOR CO

I haven't said I would expect to come here without a franchise and without a company and build a plant, I said the company part is unnecessary, and the franchise part might be got before I came. I certainly haven't testified anything about the expense of a franchise, and I haven't included any such cost here and don't know anything about the cost of franchise. I don't know whether it is true or not that the city assesses this company for the purpose of taxation, in the amount of $100,000.00 a year over and above its tangible property, for a franchise. If that was true I didn't take that into account in valuing the physical plant of the company it pays taxes on a certain amount, it should not be considered. I am not valuing the franchise of the company. Whether if I didn't value it I should not have to take it into account of the earnings of the company in some form I should say that I should take into account all taxes paid by the company in trying to arrive at the idea of their profits; it would be informing to the court I suppose as to what rate should be charged. Taxes would only come in as operating expenses, they are paid ultimately by the consumer whatever they are and would be charged up against the income. I should not capitalize taxes or franchise.

In the Ypsilanti plant I worked a number of weeks on the plans and specifications for that plant I can't tell how much. Under the plans and specifications that I prepared we never got so far as to definitely — on how long it would take for the construction
1576 and completion of that plant, I never had the idea it would be a year. I didn't. Whether I fixed any time in my specifications,—I didn't get that far. I didn't prepare any specifications that would accompany the contract, not in the primary form; I prepared preliminary specifications describing and outlining the kind of equipment, etc., so as to get at an estimate of the cost I made on the plant; and it is true that is the nearest I ever came to building a gas plant.

1577 I was asked to bring in the details of my net construction cost of the meters, more particularly covering the item of $1.40 per meter for freight, connections, setting and testing of the meters, that and some other things; I haven't brought in that item but certainly expect to. I explained that I used the one uniform sum of $1.40 not as representing the cost of the setting, connections, freight etc., of a particular size of meter but as a fair amount to allow for the range of sizes and prices here. I have a detail apportioning the part of that $1.40 for setting the meter unless I have lost it. I don't often lose things, but it will be impossible for me to give that until I get my detail here. I now produce my Haverhill valuation on everything, I don't know what point was in counsel's mind when I was asked to bring it in.

In the Haverhill case I put in the weight of the 4 inch pipe prior to 1901 at 17½ pounds per foot; and subsequent to 1901 I put it in at 19.4 pounds per foot. In Lincoln I put it in at 17 pounds per foot.

I am considerably acquainted with the practice of engineers in allowing interest during construction of a plant,—the amount

COPY

allowed and the period of time allowed. In proper amounts such an allowance is a proper item. I can't name any single rate that I would say was the common rate to allow, but something like 6%. As to what portion of the total time required to construct a plant interest is allowed on the amount required to construct the plant,—I would say it varies a great deal, there is no uniform amount. It is no more common among engineers to allow interest at 6% on the total amount invested in the plant for one-half of the period required for the construction of the plant, than various other practices as to the amount of interest allowed. It is not to my knowledge, and I have no reason to think it is a common allowance by various Commissions throughout the country as well as the Courts. I don't have any such precedent of that kind specifically in mind.

1578 I should not doubt there might be found a precedent where someone had allowed that amount perhaps. The only standard among engineers to determine the period this interest is to run is to try and get into accord with the facts, which will vary according to the construction. There isn't any uniform rule of practice which takes the time the total investment will be put into the plant and compute the interest for one-half of that period, and I don't agree with the statement that it depends on what the particular engineer sees fit to place on it. The amount of interest I have allowed on this plant is the total amount per year at 6% for 30 days, I don't now recall of any adjudication for that specific amount. I wouldn't necessarily expect, if I came here to construct this plant, to have all the money arranged for before I entered upon the work, for the purpose of constructing it, it might be furnished as the work went along well enough. As I have testified a number of times if I were going to borrow the money and it was to be furnished as I went along, I should pay the interest on the money during the period that the different parts of the construction was out of use after the money had been invested in those parts. I haven't testified that I should expect the work of constructing the plant to proceed uniformly throughout the year. I should expect to complete the plant as rapidly as was consistent with proper construction and reasonable methods. Whether my investment per month would be about uniform going into that plant to complete it within 12 months, I don't think so, I think the investment would be lighter in the earlier months. I would not necessarily have to make an investment in the real estate before I started, but that would be expedient at some very early part of the year, you couldn't begin to construct your works or definitely decide on the proportions of the heavier part of your main system until you knew where your works would be. I think it is fair to this company to compute the interest

1579 upon the reproduction of the equivalent to this plant and compute the interest on that for 30 days; I think I testified that it might be as great as ¾ of 1%, but I thought ½ might be enough, I should not want to hold them to just ½ of 1%, but ½ of 1% would be ample.

In addition to the interest upon the investment I put in the con-

tingencies and omissions in my estimate of cost, I would not eliminate those. I said I had provided for them in the amounts I allowed.

In figuring the quantities going into a brick building, I figured that the company could let the contract for all the buildings it has, taking into account only the element of brick now, on the basis of $15. per M and the contract for that would save you harmless as to the brick, on that basis the contractor would take all the risk and cover it by his contract price of $15. per M gladly, that is what I figured. I didn't consult a contractor here until after I had come to that conclusion. Then I only consulted Mr. Assenmacher, and that confirmed my conviction.

In my 7% I figured only a very small and indeterminate amount for casualty insurance, or liability, the contractor would carry most of that, to which the company's witness Mr. Steinmueller testified, but there would be a little that would not be covered by the various contracts and I considered that a very small fraction of 1% would go for that purpose.

In my exhibit "347" showing the total gas sales of the Lincoln Company from 1905 to 1912 on the basis of $1. per M cubic feet, that is an estimate of mine. Whether I took the total sales as they were made during those years and applied to those sales the rate of $1. per M cubic feet,—that is not quite accurately stated.—I make a reduction of 20 cents per M feet from the income of the sales made in the respective years and get the income, I take the actual income as reported in the gas reports and deduct therefrom 20 cents per
1580 M. I took the stated income and the stated feet of gas sold in Lincoln only, and on that stated feet of gas I computed the amount at 20 cents per M feet sold and deducted it from the stated income. So that exhibit "347" gives my estimate of what the company would have received for each of the years from 1905 to 1912 had the gas been sold at $1. per M cubic feet. I don't show in exhibit "347" the number of feet of gas the company would have sold during each of those years from 1905 to 1912 at $1. per M, because there was sold more than shown in the exhibit; I took the amount they sold and what the final result would have been, but the $1. rate would have substantially increased those sales. I haven't shown any such estimate; what it comes to I have simply taken the amount of gas sold and applied the $1. rate to that during those years. If it had resulted in an increase of sales I didn't estimate that nor take it into account in this exhibit. I haven't taken into account any increase in the operating expenses of the company due to any increase in sales if there had been any, I simply dealt with the expenses as they were, and with the sales as they were in those years, and made the deductions for the lower rate and also made a certain revision of the expenses; I started with the expenses in those years and haven't made any estimate about the change of expenses on account of the volume of gas sold. There are no expenses shown in exhibit "347" and I didn't estimate any there, but in exhibit "348" I did.

Undoubtedly there would be an increase in sales if the gas rate were reduced to $1. from 1905 on, and there would be an increase in expenses from what I have estimated,—I don't say it would be an

POOR COPY

increase in expenses from what the company reported,—I don't think it would be as much as that; still there are variations in the expenses between my estimate and your company's report in one de-
1581 partment—that of the general management of the business—whereas the greater increase in expenses for the output would come very largely from the manufacturing department, so I couldn't compare the matters very well, because any that were made for the greater output of gas were made by the expenses of the manufacturing department. That would be an additional amount added to the expenses.

In exhibit "343" I show the total operating expenses for the years 1905 to 1912 inclusive as estimated by me, starting with the records of the company and making such changes, deductions or revisions in those records as I think should be made. So that in the year 1907 my estimate comes to this: Assuming your expenses down at the works which you say were $141,621.49,—I am not certifying as to their correctness at all but just taking them as you have taken the items,—which I have classified as expenses down at the works as correct and adding all other suitable items my estimate amounts to $127,135.18; that was arrived at, in part, by an analysis, criticism or examination of the items entering into the total operating expenses of the company for that year, I did not apply a percentage of reduction to any particular department of the operating expenses to get the 18 cents at the end of my $127,135. In a sense I picked out particular items in the operating expenses for that year that I considered excessive and deducted a fixed amount for those items, because I segregated certain items and added them up and found that they amounted to a certain number of cents per thousand and concluded that was too great—too excessive a number of cents per M. Whether it was a question altogether in my mind of finding out how many cents per M the expenses should be in any department and if the amount actually incurred by the company was in excess of that amount, whether I reduced it to the amount I thought it should be,—Will say that I looked the items over in a general way in that connection, and I also took a pretty careful general view of the way
1582 the expense was run up to the amounts quoted. Answering whether in exhibit "348" I have not taken the accounts of this company where they have actually spent the money to manufacture the gas and distribute it and have said to the court it could have been done for less money and the company should not be allowed the expenses it actually incurred,—I say as far as actually incurring the expense, I didn't testify as to that, all I know about what the company incurred is what its gas reports say, and I have certainly said it didn't need to spend the amount it said it had spent. I did not say the company did not spend the amounts its records show it did spend, I simply refuse to certify that it did spend it. I don't think any such amount was ever properly spent; if it called the money the company parted with in the way it did part with it to make up these expenses for gas expenses the company may so call it but I shall not label it that way. My attention has been called to

POOR O

no particular items, the enquiry has been about the bunch and I am trying to answer as well as I can on the questions asked.

In referring to those items I say were not proper items, and in making this reduction for the year 1907, I have the items set up here that I criticized in the aggregate; I haven't got the certain specific items, but have taken a group of items and given my estimate for the total charge for that group as set out in the exhibit. I had before me then the items to consider as entering into the operating expenses for the purpose of determin-g the amount that should be deducted from those amounts for any particular year, those items for 1907 are given in exhibit "285".

I haven't eliminated specific items in this group shown in exhibit "285" and I have said too that taking those items together amounting as they do to 20.58 cents per M feet sold that the aggregate of the alleged expenses for such group of items is excessive in that
1583 year, although it is less than two-thirds of what the company has charged in a later year. By a good deal of additional work I could eliminate specific items; the only trouble in trying to do that is of knowing exactly what services were charged under the different heads; the services in the company's books are charged under a large number of headings, and it is impossible to determine, without a great deal of investigation, beyond what I have made, just what things were done for the different amounts given under the different heads as shown in exhibit "285".

As to whether I did that those operating expense accounts and set down for the purpose of examining and determining any particular amount or item of expense that should be eliminated, or that I considered excessive,—I would say that I consider these items here of general expenses and management very excessive, as a whole. It is true that by reducing to so much per M feet reduces no particular item,—not because it is impossible, impracticable or that I couldn't,—but because it is more difficult and a long process of investigation required, of just what necessary work was done for the particular expense the company set down. I haven't made a deduction on a percentage basis. I deny the proposition that I undertook to fix the operating expenses at so much per M regardless of the items entering into the operating expense account.

The statement that in exhibit "348" I have eliminated certain items appearing in the operating expenses for each of the years from 1907 to 1912, isn't a correct statement; I have just testified that I didn't eliminate the specific items, but took a group of items covering a certain class of the company's expenses, namely, general office expenses and management, and I concluded that group of items covering that part of the work of the company aggregated too much, and not being able to tell just what parts of that were charged under each of the many items the company has it separated into, I
1584 made my deduction on the basis of allowing so much on that part of the work done by the company. Exhibit "348" does not make the deduction in a lump sum on the basis of so much per M feet sold,—I have an exhibit where I say what the amount of the office and general expenses of management should be; exhibit "348"

R COPY

included the company's own statement of the manufacturing expenses and materials and labor at the works that I have simply copied in and assumed to be as the company stated, for the present purpose.

To state precisely, I would not say that exhibit "348" shows my total estimated expenses of the company for each of the years from 1905 to 1912. The heading of one column is "Dollars estimated expense", as against the different years, but that has already been fully explained to mean the company's stated expenses in the materials and labor of making gas plus my estimated expenses for o-her items, so that that column heading is only a part of my estimate and a part of the company's statement. It is the total expenses as I estimate the expenses to be for each of those years, assuming that the company's statement for that purpose to be correct; I am not going to cut myself out of the opportunity and right to criticize the Company's manufacturing expenses, which I may wish to do later, and that is just what is in my mind in making this reservation. With that reservation in mind those expenses under the column "Estimated expenses" are intended to include all of the fair expenses of the company for each of those years in the manufacture and sale of gas, but not all the money it spent. That is, not all the money the company actually did spend, but what I think would be a r-asonable and proper amount to spend, assuming the company's statement of material and labor is reasonable as I have copied it into that column, from their books.

I think in exhibit "339" I have undertaken to show the gross earnings of the company, in its gas department, for the years 1905 to 1912 inclusive; that is the purport of the exhibit.

1585 As to whether exhibit "339" shows just what the records of the company shows the gross earnings to be for each of those years,—I am unable to recall now that the column headed "Dollars income in Lincoln", varies in any way from the fair import of the records as to Lincoln. I don't remember whether the company seggregates its income in Lincoln from the other; I rather think it does not seggregate it. I included in this table as income in Lincoln not what the company got from some outlying municipalities. I don't remember that the records on their face show that seggregated income, I think it would involve a computation to get that. But by fair inference all of them are found in the records of the company. So I would say that this tabulation is intended to show the gross income from 1905 to 1912 as the gross income shown by the records of the company for the sale of gas in Lincoln.

I show a column in the same exhibit what I estimate the total operating expenses in Lincoln alone for each of those years should have been,—always with the proviso that I am assuming part of that operating expense by the company, it has reported it,—and part not,—not necessary to be, but resting in my estimate.

Referring to exhibit "345", as to whether that exhibit shows the total operating expenses of the company in Lincoln alone, as shown by the records of the company for each of those years, as I found it in the records for the company for those years,—I will say that I am inclined to the opinion that,—while it shows the total expenses for the years mentioned, taking the fair meaning of the gas reports of the company,—that it does not show the expense exactly as set down in the gas reports. That is taking what I consider to be the fair meaning of the report. I think I had to make a change on account of the way the residuals,—coke and tar,—were treated, not thinking that the reports really meant in all cases just what the final summary figures would indicate. In other words: I went into
1586 the substance of the record and tried to get at the fair meaning of the report as a whole, rather than take just the footing of the total expense for a year, so I rather think that would apply to exhibit "345", that is my best recollection. Whether that would make a slight difference in any case,—I wouldn't dare to testify to that, it might make quite a difference. It was a habit of the company in its gas reports to charge in coke at the cost of both the labor and coal to make it, that had been paid for and charged to expenses in the same account. I present in exhibit "345" what I understand the records of the company to fairly mean taken as a whole, that is, the gas reports to mean taken as a whole, and without meaning to say that the figures are necessarily found in just that form in the gas reports. Taking the year 1912, as I understand the records of the company they show the total operating expenses for Lincoln alone, to be $170,507.82, and according to my exhibit "339" my estimated expenses for 1912 for Lincoln to be $136,145.01, or about $34,000. more than they should have been. The .01 cent is the result of an

estimate of so much per M feet of gas sold for a certain portion of the expense; I am not particular about the 1 cent, I would just as soon make it 2 cents or drop it off entirely. I don't think that indicates that I was using some general rule to reach the amount of expense applying a certain amount of cost to a certain 1000 feet of gas sold to get the result,—the company's expenses are just the expenses it did have that runs into cents. I deny the statement that I was using a general rule.

Exhibit "306" shows the net earnings of the company, as per the gas reports, for the sale of gas in Lincoln at $1.20 for each of the years 1905 to 1912, as shown in the records of the company. It was prepared by me showing what the net earnings of the company was for each of those years, as I understand the records, without saying that any of the company's excesses should be changed for some others,—just taking the records as they stand.

1587 The exhibit "304" shows the amount of the expenses of the company in the respective years as I understand it, on the full meaning of the records. Whether for the expenses alone for the sale of gas in Lincoln alone, I don't so read the exhibit, and a*n* not able to state from pure memory that it is so limited, it appears to apply to all of the reported expenses of the company. I say it is the entire expenses of the company for Lincoln and outside, basing that on the face of the exhibit, which I believe to be correct. The total estimated exp-nses of the company for 1907 was only $127,671.40 as estimated by me; for 1908 $129,693.72; for 1909 $121,300.04; 1910 $119,069.95; 1911 $121,261.28; 1912 $140,399.11. I don't know that those six years make a total of $759,395.50 *i* haven't that total. Whether assuming that to be the correct total, the difference between the actual amount expended by the company for operating expenses for those six years and the amount I estimated, for those six years is $134,261.82. — — I am not able to take all those additions off-hand. I specify a large group of items in number and I say as a group they are all together. I have neglected to seg*g*regate the specific items because of the labor involved and not knowing just what labor was performed under the head of each item. I never did seg*g*regate them, I have set out the group of items covering certain definite sorts of services that must be performed by the company to carry on this business, and I have said the amounts charged in the company's gas reports for those services is excessive, in the amount of $134,262.82, assuming that is the correct figure for the addition of those six years, which addition I haven't made. I have pointed out the particular items that are too big, and as to that now call attention to exhibit "290", in which I give in the company's own language 19 items, as I count them, under the headings that occur in the gas reports of the company, and the aggregate of

1588 those items is 31.12 cents per M feet sold in that year. Now looking at those items on their face, it is uncertain to me just what services may have been performed under the head of a particular item, and it would require a very extensive investigation into the company's methods of working to be sure. If I said certain expenses under one item was too big because they involved the do-

ing of a certain work that wouldn't cost as much, I might be met with the suggestion that some other work was included in that item. So I have taken the whole cost of the items constituting the general office and management, all those services that must be performed as indicated by the company's headings and I have said that, measured by the experience of other companies and this company's in earlier years, when the gas out-put was less,—that 31 cents is an unnecessary charge for those services. I reduced that 31 cents to about 12 cents as I remember.

The problem of picking out particular items is complicated by the fact that the company has two departments—gas and electric—in which they apportion those general expenses, and also by the large number of entries under which they have their services made here; suppose I take the item of executive salaries $8917., or the item of promoting new business $19,692. and I attempt to say that one is too big because it don't cost that much to do such work as it ought to be done for under that heading; I will be liable to be met with the suggestion that there is a lot of other work that I hadn't thought of — done under that heading,—work that I thought was under one of the other headings,—so the only way is to take work of a given kind or character, you might have all of these charged under 100 different headings, that wouldn't change the amount to manage and pay these salaries,—the way you divide it in your books,—the company might divide it into 100 different charges,—and how could
1589 a man, without a great amount of labor investigating as to the company's office methods to see which particular labor came under each head.

Whether I would have difficulty in stating my criticism of the $8000. item for executive salaries because it is something specific and the amount of salary ought to be tested out to determine whether it was excessive or not,—I would say if I could find out exactly what the company got for its alleged expenditure of $8000. I should not hesitate to criticize it, there would be no trouble about it. If the company will tell me here exactly what is obtained for that item I will be able to tell whether I criticize it or not definitely, or tell what I would reduce it to. I can assume what I ordinarily understand to come in the classification of executive salaries. Upon that assumption I would be able to tell whether it was excessive or not, but a more direct and comprehensive method is to tell whether it comes under this whole bunch, that is just as easy to tell as under one of them. A good deal easier and more direct, it don't give a chance to jump around and say it is charged to that or some other heading. The company has a definite general classification of the work, namely, the general management and payment of general office expenses apart from taxes, depreciation, materials and labor making gas, it is the one I have dealt with year by year and I haven't thought it worth while to try to find out from the company's office, how these services are charged under these different headings, I didn't know to whom I could go to find out. The exact classification mentioned as produced here was never offered to me. I don't recall that I asked for it; the company had a large printed book of

instructions which I didn't think was profitable, in view of the time at my disposal, to wade through; I wasn't sure where I would get to if I did, as to what particular charges the company charged under each one of these general headings. Whether I just took the
1590 general rule of so much per M feet because it covered all of the expenses in the department of salaries and executive officers and taxes at so much per M here or anywhere,—I would say no, I didn't include taxes; I allowed their taxes they say they paid as an entirely separate item.

It is absolutely untrue and unfair to say that outside of the actual labor and material expenses at the plant, everything else that lays outside of the naked expenses of the plant I lumped off as being covered by an estimate of 12 cents per M. It includes all of the distribution expenses except materials and labor making gas, repairs, renewals and taxes,—all of that is under one heading in my exhibit "290",—and that expense I treated under the one general heading and in the year 1912 was the allowance I made running up to the earlier years we are talking about.

You can't answer by saying simply all of the expenses of manufacturing gas should be about so much per M and let it go on that same basis, because the money for manufacturing gas is money the company has to pay to other persons that are not under its control, but its officers can reach their hands into the treasury of this little corporation and take out what they will because they control it; but the man who sells it coal, it can't do that to him, he has to sell in the open market and all the company pays him is the competitive price for coal; I assume what the company pays for coal to be a fair price in this part of the country, and so for oil and so forth in order to come to the amount in exhibit "290" of 31 cents. Whether I want to reserve the right to criticize,—I say I do, but I haven't yet that I may find wrong for any purchases of coal.

Referee: The reservation will stand without making it special; criticize everything. To which the plaintiff excepts.

1591 In exhibit "341", as I understand the records of the company, I have shown the actual amount of money expended by the company for gas making materials labor and taxes that I found in the records of the company for the years 1905 and 1912.

Being asked to refer to exhibit "304" and to state whether I have there shown what I understand the records of the company to show as the total cost for gas making materials and labor plus taxes for each of the years 1905 to 1912,—I say I haven't shown the sum of the materials and labor plus taxes alone; it is plus various other expenses also. I have shown in exhibit "304" what the records of the company show the cost to be for materials and labor making gas under one seperate colume from 1905 to 1912; and in the same exhibit show what I say the records show the taxes to have been for each of the years 1905 to 1912 in a separate item; so by adding those two items together I have the cost for materials and labor in making gas plus taxes for each of those years, but the addition is not made in that exhibit, however. As I understand the records that exhibit shows what the records of the company shows with respect to the

items mentioned. I didn't estimate for each of those years the proper amount for gas making materials, labor and taxes, I took what I understood the records to show, that appears in exhibit "341".

Exhibit "341" does not show my estimate of the amount for material and lab*le* making gas plus taxes, I haven't estimated those items, I have added them. The heading is for materials and labor plus taxes per gas reports not per Adams. I accept them with the reservation I made that I might want to explain them further.

I show in my exhibit "342" my estimate of the proper amount to be expended for salaries, office, distribution and general expenses for each of the years 1905 to 1912, in cents per M cubic feet of gas sold. And also in dollars showing what it would amount to. I also show there the number of M feet of gas sold for each of those
1592 years. And I obtained that by multiplying the amount per M feet 12 cents as I found in 1912 by the number of feet to get the total amount of expense I say should have been incurred for those items. It is absolutely untrue that I obtained it in that way without any reference to any details in the reports of the items making up the expense for salaries, office, distribution and general expenses. Turning to exhibit "302", I have undertaken to show what the records of the company show was actually expended for the years 1903 to 1912 for salaries, office expense, distribution and general expenses, but I have left out here my usual precise designation as to the source of the figures; I believe the figures in exhibit "302" to be from the gas reports of the company giving their statement of the expenses for these particular items which are the same items I refer to in exhibit "342". Whether the difference, as stated by counsel, between the amount actually expended by the company for the items stated for the years 1907 to 1912 as shown by the records of the company and the amount I estimated to be the proper amount for those items for the same years, is $168,567.13,—I haven't made any such addition, and don't consider it particularly illuminating and I haven't got it; moreover, my figures run from 1905 to 1912, I don't know whether those are left out purposely by counsel or not. It is true that my estimated expenses and the company's reported expenses shows 1907 to 1912, the addition I can't certify to.

Whether by that process I eliminate $168,567.13 of the actual operating expenses of the company,—I don't admit that the company ever incurred any such expense, I don't think it can fairly be said that the way the money is taken out of the company's treasury that the expense is actually incurred. The money goes whether that can be called actual expense. That wouldn't have gotten away from me if I was in charge of the interests of the stockholders. You couldn't beat the taxes very well, but I have allowed them
1593 all; I don't think you could estimate them.

Exhibit "304" shows the amount I understand to be charged for repairs and renewals for each of the years from 1907 to 1912. I haven't any definite suspicion that the repairs were not eventually made, I doubt if they were made just as charged, I have a suspicion that they were not, but I don't doubt the repairs were

ultimately completed, as shown by these exhibits here and in the amounts shown, but I don't want to be understood as saying that they were really repairs so charged, but things the company calls repairs.

In exhibit "341" I don't go quite so far as to undertake to show what in my opinion should have been set apart and retained out of the earnings of the company, for repairs, renewals and depreciation for each of the years 1907 to 1912; and dictate to the company what they should do with the money they got. The exhibit indicates what, in my mind, would be fair to allow for such of the property out of the income, for each of those years. If the company chooses to put it in New York or put it into the plant, they would have to bear the burden, I am not dictating, but that I think is a fair amount. I have added depreciation in exhibit "304" to the item of repairs and renewals. That accounts for all of the difference between the amount shown in exhibit "304" as expended by the company for repairs and renewals, and the amount shown in exhibit "341" as the amount that should be carried for repairs and renewals. I don't accept the amount charged as repairs and renewals in the company's records for many purposes as a sufficient and proper amount; it would be impossible to properly estimate the amount of repairs and renewals without taking into account the depreciation; when the renewal occurs it absolutely takes care of the thing renewed and I can't express any opinion about the proper amount for repairs and renewals without including the element of depreciation. As to whether I can give its entire cost where

1594 I can't separate between repairs, renewals and depreciation,—would say that I can separate approximately between repairs simply as such, and renewals and depreciation, but renewals are depreciation; but taking care of what counsel asks for,—I can't separate a thing from itself. I can't do it. In one of my other exhibits I separated the amount of the proper charge for repairs and renewals; in exhibit "232" I have the annual depreciation in dollars as $10,914.26 in 1912, that includes all renewals,—the cost of renewals and depreciation cover the same items, and dividing that by the thousand feet of gas sold that year would give the amount of depreciation only. I include renewals and depreciation as one item, they are the same thing, and the balance of the amount I find in exhibit "304" is for repairs pure and simple as near as you can separate it.

I have figured it all over carefully and the amount that should be set apart fairly for repairs per M feet of gas is the difference between what I have allowed for depreciation and renewals and the total amount I have allowed per M feet sold, that is this allowance here in exhibit "343" for which I have allowed the company 9 cents right through that period of years for repairs, renewals and depreciation. For repairs alone somewhere around 3 cents, 3 cents is an ample allowance for repairs. 6 cents would be for renewals and depreciation. I allowed the company more than my computation showed was necessary to be generous. I based my computation on the valuation of the company's property, for depreciation and

renewals. I didn't get the amount of the repairs at all from the valuation of the property to make the repairs and depreciation. I got the renewals and depreciation which is the same thing. To get that I took the cost of each item of the physical plant and divided by the estimated years of life to get the amount that should be allowed annually for the depreciation and renewals of that piece of plant and added all of those together to get my totals. That is where I take into account the difference in the life of the equipment that entered into that.

1595 The amount to be used for repairs I got from an observation of the amount of that cost in a great number of plants and a great number of instances,—I refer to a great many plants in Massachusetts,—and the records of those plants because that is what I depend on considerably and to some extent on the records of the company's plant as far as it has gone. I found from the records of Massachusetts and those companies that 3 cents per M only just covered the item of repairs, or thereabouts, it might raise it to 3½ cents. I have had no occasion to correct my judgment.

Asked if I should be mistaken about what the records show whether my conclusion would be wrong, should this company have things a little b-low on its records than the Massachusetts companies have charged 15 and 20 cents for repairs and renewals,—I would say for repairs and renewals there were particular things that weren't given in the showing I am talking about; I am talking about an analysis of the records and what they have done, and found out what money really went to repairs and not to extend the plant. I brought the records here of Haverhill, Lynn, Lawrence, Cambridge Taunton and Charlestown to show what they were charging for office expenses and general management and they don't show the depreciation or other charges to repairs at all.

Whether any of the companies in Massachusetts carry repairs separate and apart from renewals,—they are reporting now to the Massachusetts Commission repairs and renewals on meters separate, segg*r*egating between repairs and renewals. I claim to have based it specifically on some records of Massachusetts reports on meters that segg*r*egated that. I would have records of the Massachusetts reports to enable me to segg*r*egate on meters between repairs and renewals, and I have that on all the other equipment that goes into the gas plant and when I want to segg*r*egate between repairs and renewals I looked to see what the company did with the

1596 money and it says it spent it for those combined purposes.

In determining the amount set apart for repairs, renewals and depreciation as of the time when I valued this first property I took into account the condition of the property. It is a very violent assumption to say I could tell from the records the condition of the property considered. As to efficiency I assumed this property in fair operating condition. I should have to figure out the percent of efficiency. The property is as efficient as a manufacturing machine or tools as it ever was, I don't know as the efficiency has declined.

If the property had been allowed to run down and I were to

value it now whether I would make a larger allowance for repairs and renewals than if it had been kept up,—I should not make an allowance for renewals in the future to compensate for laxity in the past. I think Justice Moody's talk against that in the Knoxville case is right.

As soon as there is time I will prepare for the company's use in cross-examination a detailed statement of all the items covered in the cost of construction by my item of 7% for engineering, interest and so forth, giving the amount apportioned approximately as near as I can to each item entering into that total of 7%.

Just as quick as there is time I will also prepare a detailed statement showing the items entering into my $1.40 cost for freight, connections, testing, etc., on the meters. I think I have it all tabulated, I did have it. I have a big bunch of computations.

I will not prepare a tabulation for the company's use on cross-examination of the division of the amount I apportion for repairs, renewals and depreciation, giving to each of those items the amount I apportioned for the total, because it is impossible and impracticable to prepare such a statement; I will explain how those ac-
1597 counts are made, but will not prepare a detail unless ordered by the court. Whether I will venture to give a statement as to what amount should be provided for depreciation as apart from repairs and renewals,—I will say it can't be for renewals, because renewals is simply another name for the item that takes care of depreciation,—when you renew the plant you take care of that,—repairs can be separated with a fair approximation, that I am willing to testify about, but I can't give the renewals; it can't be separated from renewals in any exact way. They can be separated from repairs in an exact way,—renewals and depreciation together,—remembering that those two words mean substantially the same thing, can be separated with a fair degree of approximation from repairs, simply repairs. By repairs, as I now use it,—having in mind that the word is used with great latitude,—I mean in the narrow sense of just fixing up your equipment without replacing and renewing it which is necessary to keep that equipment going. I can segregate renewals and depreciation together from repairs with fair approximation, but that is the kind of repairs I defined, namely, just keeping the very things that set there in a fair condition of operation until they have to be renewed. If a length of gas main had to be taken up I would call that a renewal of a particular section taken out. I would call a repair of a gas main in a block a renewal, for one length I should not quarrel with anyone who classified it as a repair. I defined repairs as fixing up a specific item of plant and keeping it in condition and doing whatever you need to do with it, but when you take a large and wholly complete item of plant and renew it that isn't repairs, strictly speaking, although the word "repairs" is used with great confusion and without meaning the same thing in different cases.

Whether I find any confusion in the records of this company in their account of repairs and renewals as distinguished from
1598 new construction,—I would say that renewals isn't construction and I found in the company's repair and renewal account

what appeared to be new construction. I don't consider the company has thrown any light on it,—it is just as dark as the dark ages,—as far as its account is concerned, and as far as its explanation of its account is concerned in any that I have heard.

I base my judgment very largely on the amount of repairs, renewals and depreciation that should be set apart on what I learned in Massachusetts, studying those plants, and I got some idea by looking over this company's repair and renewals account here, and seeing,—as I think I see,—very substantial elements in it which are actual renewals, that is, putting in an absolutely new piece of machinery or equipment there by way of a renewal or extension of the plant, but I haven't had time to analize all of the company's repair and renewal account to find absolutely any equipment that has gone in just how it was expended in keeping the existing plant in condition to operate.

I have a very definite opinion about the amount that ought to be set apart to take care of the items of repairs, renewals and depreciation, I find in connection with that kind of a plant there is no fixed amount in respect to the plant counsel is talking about.

For the mains of the plant that are not open to view I have not fixed any amount that I should apply anywhere for repairs, renewals and depreciation; I shall apply what I do apply to any situation according to the facts of that case; because the company's mains for over half their length have wrought mains, that means a different depreciation proposition from the others where they have bigger mains and cast iron mains, so you have to consider the local facts of the plant you are dealing with. The wrought iron
1599 in proportion to the cast iron in the distribution system here does not compare in proportion to that of the companies in Massachusetts; the company here has decide-ly a larger proportion. I brought that out in one table here.

The 9 cents per M I set apart covering the three items of repairs, renewals and depreciation is not an uncommon amount right along; that is what I have allowed in other cases. The Massachusetts Commission has nothing to do with setting apart any amount for depreciation in reference to the companies in Massachusetts, in such a general way as that, the- have set something as to specific cases.

I think I said something about this in the Racine case. Whether I advised the Wisconsin Commission that 12 cents per M was a proper amount for repairs, renewals and depreciation,—I say I didn't advice any Commission that there was any flat or fixed rate that applied indiscriminately to different plants. I don't remember the amount I gave for the Racine plant; I may have said that 12 cents was right for that plant, which was a bigger and much better plant than this. I went into the works and looked at that plant and had a list of the equipment. I could just as well see the distribution system in 2 hours as in 2 years. If I said 12 cents was sufficient there I justify my saying that 9 cents here is a sufficient amount because they have a more extensive plant than this one here. I know that for I had a list of the equipment for both plants. I don't remember how much the Racine plant was valued at, I have the Commission's valuation in

detail and you can have it. I haven't my testimony in town that I gave there; counsel has it and has copied a figure here and there from it.

I don't recall any amount having been set apart for repairs, renewals and depreciation in the Consolidated Gas Case, and I don't know who is referred to as setting it apart.

1600 Asked whether the amount is not specifically mentioned in the opinion of the court on the report of the Special Master, and whether I claim I am ignorant of the fact that a specific amount for repairs, renewals and depreciation was set apart in that case,—I would say, that I claim that I don't know of any amount being approved by the Supreme Court of the United States in that case as the proper amount for repairs and renewals in that case. I don't recall that the Company set apart 10 cents for depreciation alone in that case; and I don't recall any such thing as the court commenting on the fact that the company had set part in the neighborhood of 15 to 20 cents yearly for a great many years, running back 20 years, for repairs, renewals and depreciation and in view of that fact 11 cents per M was sufficient for the purpose of determin-g that case. I should have to know more about it than the question states before I can tell what influenced me; as applying to the mains it was because the Racine plant was so much better than this one that makes it so much longer lived than this plant; they had a great many more expensive and longer lasting mains than this company has. They had cast iron mains I think. I think I gave the lives of the cast iron and wrought iron mains up there, whether I gave the wrought iron mains as longer lived than here I would have to say that lacking information from counsel that when I give information I give it fairly, all I have before me is the fair purport of the figures I am quoting.

I think I have here my exhibit "341" that shows the gas making labor and materials plus taxes for 1907 to 1912 as shown by the records of the company; it shows what the records of the company said for the materials, labor and taxes as I understand those records, there is a little question about the materials and labor, but the taxes I think there can't be much question about.

1601 I don't think there is any question about the materials even in the years 1911 and 1912, I think that comes from when the company was dealing in residuals; that is the only item of material involved in the question. I haven't estimated; I haven't estimated the expenses for that, I have taken the company's statement. The first item for 1907 is materials, labor and taxes per gas reports $87314.05; that does not include anything in that total for depreciation. It is possible and probable that a small part of that labor might have gone in the way of repairs, or possibly some small renewal at the gas works; I haven't made any allowance for that, if that is true it is a possibility, I haven't an-alized or done anything with it. I claim the books of the company the gas reports show that $87314.05 was the expense for gas making labor and materials plus taxes for 1907; they are the only books I have extracted this from.

The same item for 1908 shows 86707.70; and for 1909 $77378.98;

in those three years I have made corrections in those figures to take into account the item of residuals, I tried to keep out what I thought was the meaning of the gas reports, and have put those down to what I thought was the fair meaning of the reports. Assuming the books of the company, which I haven't before me, show as the amount spent for gas making labor for 1907 to be $92332.14; for 1908 $88286.29; and 1909 $78679.87, the correction I have made would be in the residuals resulting in the difference, that is all I attempted to correct was the residual item, but I don't agree with that figure.

I do not now know why I eliminate from the items of expense for gas making labor and materials plus taxes in 1907 the amount of $5809.19; all I know my analysis resulted from a later exhibit in
$87314.05 for 1907, and the later exhibit shows the items I
1602 included. I don't know whether for 1908 I found the company had expended $1578.59 in excess of the amount that should have been expended for gas making labor and materials plus taxes, I haven't a copy of the company's books before me, I only have my analysis of what I think the books show. I don't know whether for 1909 I found the company expended for those items $1319.89 in excess of the amount that should have been expended for those items, for the reason just stated. Whether my record shows that the company lacked 1 cent of spending as much money as it should for these same items; I make the same answer. I can tell for 1909, it is $77378.98. I think for that one year I show a larger expenditure than the company's books do; I attempt to show every year what the company's books show. Whether in 1911 the company should have spent $71.59 more than it did for these items, all I can tell is what my figures show. I don't agree that my estimate of expenses for 1911 for these items show $71.59 more than the books of the company show was expended for those items; I have shown what the books show, if there is a mistake in addition I don't consider that a fair showing of the company's books, nor any other mistake in going through the figures but taking the fair import of the books as they show there.

I think I have here the item of salaries, office, distribution and general expenses, shown by the records what the company expended for those particular items for 1907; I have grouped the items in my exhibit "285" called all expenses, except materials and labor making gas, repairs, renewals and taxes, in the form of language I have used. I show there an expenditure as taken from the company's books for 1907 of $36,912.89; and on page F of the first part of the folder in
exhibit "344" in 1907 I have estimated as a sufficient ex-
1603 penditure for that item by which I mean, all expenses, except materials and labor making gas, repairs, renewals and taxes at 13½ cents; In dollars according to my exhibit "342" that amounts to $24,214.41; whether I have eliminated from the items shown on the books of the company the amount of $12,698.48, of the expenses incurred for those particular items for that year,—will say that I have not made the subtraction, I can make it, for that item I make it $12,698.48 less than the reported expenses in the gas reports of the company.

Now in the distribution and general expenses of the company, I haven't included in my estimate of 13½ cents any repairs and renewals, or any labor upon repairs and renewals.

In the figures on gas making labor and materials plus taxes, there are included in those figures some minor repairs; I haven't done anything there except to simply copy the company's figures for what they are worth.

In this tabulation including salaries, office, distribution and general expenses, I include all the labor the company employed in the distribution of gas, office help, clerical help, and work in collecting the gas bills and taking care of the distribution system; all necessary and suitable expense in getting new business; but not a cent of expense suitable to handling appliances,—I don't allow any expense against the cost of making gas for selling appliances; that business should take care of itself. Whether it is the practice or not in Massachusetts, I know many of the companies do handle appliances,—gas stoves and lights of all kinds,—treated by the companys themselves as a part of the operating expense and reported to the Commission as such. I haven't said that you ought not to be allowed that as a part of the operating expense, even though I eliminate all of this expense from the distribution and general expense in
1604 my exhibit I still think your company would still have enough money to do some of it; I quoted a number of large companies doing that business and they get along with less than those figures. There is enough in the amount I allowed even if the company loses something on appliances. Whether I included in the $24,214.41 anything for handling those appliances,—I say I think an indefinite amount could be found in there that might be spent for that; it is more than the company needs strictly for the gas; it is more than these 6 or 7 other companies doing business successfully spend. I regard a comparison of the experience of the Massachusetts companies of great value to the court in this case, because the business is much the same in Massachusetts as anywhere else.

I haven't testified and don't so regard a general statement of what was set apart for repairs, renewals, depreciation, operating expenses incident to the manufacture of gas in Massachusetts a fair criterion for the court to apply here. I would not necessarily regard the necessary expenses in the manufacture of gas, the labor and material expenses, in Massachusetts a fair criterion for the court to consider in determining the cost of labor and materials for the manufacture of gas here; it throws light, but has to be taken in view of the local prices and conditions; the prices of labor and material might not be the same here, you have to go into the market and buy those and you have to take it into account. Just speaking of the manufacture of gas where you have to go into the market and buy material and labor, there are points between Massachusetts and here which would be much closer. I do not assume that a comparison between Massachusetts companies and Nebraska Companies on items of labor and material would not be a fair comparison, I think it is an ex-
1605 cellent comparison, but not absolutely controlling as against local conditions. I assume that the item of coal in Massa-

chusetts can be compared with coal here but in making that comparison you would want to find out the price per ton in the two places. Until I had that information I couldn't compare it, but you can get that from Brown's Directory that, as a source, of information I know is accurate. I tried to introduce that here the other day but counsel objected to it; it is one of the sources.

In the item of labor whether there is any difference in the amount paid between Massachusetts and here,—I think the differences are minor, I should be inclined to look for the labor prices in Massachusetts as higher than here, I am speaking of the labor at the gas-works; that is a little higher in Massachusetts than here if there is any difference, I don't think they are a great ways apart.

Concerning the price of labor in the office as between Massachusetts and here, I would say that in Massachusetts it is fully as high, the tendency is up, labor on the whole in Massachusetts tends to be a little higher than here.

Concerning the management, the manager of the Massachusetts plant would get more than a manager here, he would have to act in an independent position where he would be allowed to manage it and get paid for it, and I have taken those things into account.

Whether the difference between the cost of material and labor between Massachusetts and Nebraska are shown in the records I am produce- from Massachusetts, I will say that I tried to bring in the cost of materials in Massachusetts and counsel objected to it. I mentioned what Judge Moody said as one of the things I considered, and that influenced my mind in making up my mind about the depreciation question.

Whether I also had in mind what Justice Harlan said in the Smyth-Ames case about the comparisons between freight
1606 rates in Nebraska and Iowa, more particularly the following:

"Comparisons, therefore, between the rates of two states, are of little value, unless all the elements that enter into the problem are presented. * * * Hence, a mere difference between the rates in two states is of comparatively little significance. * * *"

I didn't have in mind anything as extremely irrelevant and immaterial as that.

Whether I knew that the number of consumers per mile of mains in any town produced in Massachusetts was not the same as the number of consumers per mile of mains in Lincoln,—I would say I know that the gas sold per mile of mains compares fairly well with Massachusetts, which comes to the same thing. I should not think you would need to distinguish between the number of consumers per mile of main between Lincoln and Massachusetts, or the population per mile in Iowa as related to the population per mile in Nebraska, it distinguishes itself. If I was figuring freight rates in Massachusetts, Nebraska and Iowa, I probably should find other factors affecting freight, I should not compare freight rates like that. Whether I would compare freight rates by the number of population per mile,—and the number of consumers,—I would compare the gas sold per M feet per mile of mains; it all comes down to the gas sold; I speak more particularly of the gas sold because I have

more in mind the number of gas consumers. I haven't in mind the number of consumers per mile of main, I usually deal more particularly with the gas sold per mile.

In exhibit "342" is shown what I regard as the proper amount of expense incurred by the company in 1912 for salaries, office, distribution and general expenses; the amount is $28,126.32; whether I say that would be the proper amount notwithstanding the company that year actually expended $72,944.99,—I say they might be allowed to have that amount, but it is more than they need, but to be generous I assume that they have that.

1607 Whether the amount the company actually spent for those items in 1912 was $72,944.99 for which items I show the company parted with as per their gas reports $28,126.32 making a difference of $44,818.67,—I will say that I haven't subtracted it. Being asked for the details of my deduction wherein I have reduced the amount of those items in this one year by $44,818.67 I will say if I have time in this case I will show in any one or all of those years a complete detail of how the company could well and easily run this little gas business in Lincoln with the amounts of money I have allowed for the expenses I have estimated. There isn't much dispute about the size of this plant, except as to the size of the business. Whether I consider the company has one-half of what it has of not, we agree in the diameter of the water gas machines and mains, by way of assumption at least, and sales of gas.

Exhibit "343" shows for repairs, renewals and depreciation the amount I set apart for those items in 1907 to be $16,142.94; that covers the repairs, renewals and depreciation, all expenses necessary to keep up and maintain the then plant. I should not say the records of the company show simply the amount for repairs and renewals,—I think repairs, renewals and maintenance are the words used; I don't think the word depreciation is used. In the company's headings in its gas reports I don't think it uses the word depreciation.

Whether I find in those records a specific amount in addition to repairs and renewals for depreciation that isn't shown in my tabulation of repairs and renewals,—I will say I don't find any record of expense. I remember of seeing in one of the reports some isolated entry about a certain depreciation fund, something of that sort; I haven't a copy here and can't tell whether it occur-ed in more than one book or not. I think there was a specific amount for

1608 so-called depreciation, written in the operating expenses; it was simply an entry written in the book that so much should be or was allowed for depreciation in general without applying it to any particular thing. I think some such language was used, as that it was carried in suspense pending a determination of the proper amount to be charged to depreciation; I haven't any copy and can't testify positively. I didn't find that it was charged out through the operating expenses at all. I understood from the testimony of the company's witnesses in this proceeding that they hadn't any such fund nor made any such payment, simply something they had written up, as indicating that the company thought they should have set it apart for depreciation, I found it in the records anyway.

I can't assent to the statement that I have added the item of depreciation to the account in the books of repairs and renewals and increased the amount that is carried in that account for the year 1907 over that shown in the books,—I haven't added something to the amounts alleged to have been spent for the so-called repairs and renewals. I have used the word depreciation, I haven't stuck it over the company's figures, I put it over my own estimate. I haven't added it in the sense counsel uses the word. I think I did, in my verbal testimony, compare the amount I set apart for repairs, renewals and depreciation, or say the amount carried by the company and charged by the company for repairs and renewals wasn't in my opinion sufficient for repairs, renewals and depreciation. I haven't added anything to the amount carried by the company as repairs and renewals, each year to cover repairs, renewals and depreciation; what I did do I made an allowance for repairs, renewals and depreciation. How much that exceeds for each of the years 1907 to 1912 the company's account shown in the books carried for repairs and renewals, I don't know, I have made that compilation; I allowed the figures in the company's books, but
1609 year by year I can't give it; I haven't added it up. It is all set out here, 1907 to 1912 inclusive along with my estimate for the amount for each of those years for repairs, renewals and depreciation. In 1907 the company charged for repairs and renewals in its gas reports $12,920.67; and I have allowed for repairs, renewals and depreciation in toto $16,142.94; in 1908 the company charged to the so-called repairs and renewals $8,915.99 and I allowed in 1908 $17,585.19 for repairs, renewals and depreciation as shown in exhibit "343", from that I am quoting what I allowed for all repairs, renewals and depreciation necessary to keep up fully the value of the plant and keep it in good working condition besides.

In 1909 the company's books show a total for repairs and renewals of $9,104.01 and in 1909 I allow for repairs, renewals and depreciation in toto $18,385.56; in 1910 the company charges for repairs and renewals $10,721.04; in 1910 I allow for repairs, renewals and depreciation $18,915.21; in 1911 the company charges for repairs and renewals $14,898.14; in 1911 I allow for repairs, renewals and depreciation $20,454.12; in 1912 the company charges for repairs and renewals $11,712.60; in 1912 I allow for repairs, renewals and depreciation $21,094.74.

These figures represent what I consider was the allowance for repairs, renewals and depreciation without saying whether or not it would be expedient to absolutely expend all of that money in the several years named or not, or whether some would lay over at times from year to year; that is enough in my opinion to allow for those items of repairs, renewals and depreciation. I referred to the records of the company to ascertain the items that made up the amount that has been spent by the company for repairs and renewals for the year 1907 or any other year between 1907 and 1912; it is all set out here in full detail in exhibits "309" to "319". In those exhibits I have given the details or the things this amount was expended for so far as they appear.

1610 I didn't make an estimate as to the amount that should have been expended for materials and labor making gas in any year; I have simply taken what I understood the company's reports to show; whether I deducted from what the records show or re-adjusted and re-arranged the residuals for 1907,—I think I took what I thought the showing was from the reports as a whole. I did not rely upon the figures in one place as against other places. I don't think it was quite the same footing the company may have had.

Whether the total entered on that record for 1907 for gas-making materials and labor, plus taxes was $92,332.10, I haven't the amount before me. I don't know that I have ever referred in any proceeding that I have seen to Mr. Floyd's book on the subject of depreciation. I don't remember what he says in his book. I do not know whether there is found there a table for determining the depreciation for different companies where the matter has been up and passed upon by the courts or commissions.

Asked to examine page 199 of said book and state if I know whether any such amount would set the number for depreciation in this particular case shown in that table,—I would say I do not know anything about it.

I haven't footed up the company's manufacturing report for 1907 as to what the cost by that report was for the gas-making materials and labor omitting taxes for 1907. The items from the report that I would include under the head Gas-Making Materials and Labor. I have got that on the coal carbonized $42,844.46. It says enricher and enrovalty, a term which I do not understand. It is only $178.41; I included it. Coal for bench fuel $2495.39.

1611 Being asked to show where that item of $2,495.39 is entered in my report,—I would say that my recollection is I went by the 1907 printed record of the United States Supreme Court. These figures are in pencil and they are so nearly rubbed out I can't cite them. The case record is here and I may be able to find it in that. I can't make out the figures

Mr. Lea: Here is money in dollars plainly in red (figures; witness referring to U. S. Supreme Court record). The figures written here in pencil that are clearly in this exhibit attached to the record are 5,347.42. I went by this copy; whether that item of 5,347.42 wasn't entered by me but for which I substituted the item of $2,495.39,—I will say that this bench fuel here I haven't followed because it says "coke". The Company made more coke than it used that year. I think the figure I have used represents the coal, the Company indicates it used that year. I have used for bench fuel, coal for bench fuel 2,395.39; and base that upon what I claimed the report of the company showed, but not entirely in that place. I got it from another place in the report; I will find it if given time. I cut the coke out. My principle was to allow for the coal for bench fuel, to cut out the coke as appears from my exhibit "292" on page 20 of this folder the Company made in the year 1907 4,143 tons of coke I will tell you where I find that in the report, it made 4,143 tons of coke residual in 1907, and deducting the coke they used for

water gas generated and the coke used for bench fuel, still leaves an excess of 947 tons according to exhibit "292"; so having paid for the coke once in the sums charged for coal and labor to make it, I didn't think it proper or necessary to enter it again as a part of the cost of making gas, and so I left out the coke; and if allowed a little more time I will show where I got it. In the copy of the gas report contained in the United States record for 1907, ending De-
1612 cember 31, 1907, on a page marked 25, that is, a special page, the gas report put in in a special form. The number of the item there is 2,321, there is an entry received or made during 12 months coke 4,117.96 tons, breeze 423.31 tons. I take that to mean coke and breeze made. The entry as here is of a double kind covering by its reading either coke made or coke bought, and, taking the whole sense of it, I thought it was coke made. It says 'received or made'. The 4143 tons of coke, received or made, was treated by me in this way: the printed record of the United States Court that I used, shows bench fuel used of 498.49 tons, that is what you can see in their report, and taken in connection with another in another part of their report showing it is measured tons. The received or made tons of coke is 4143 in line 2321. It is 4117.96, but I think that is incorrectly copied. It appears to get in there in a slightly different figure 143 instead of 117, but that is the amount they received or made during the year of coke 4117.96 tons. I find in the same report that year that the company used 498.49 tons of bench fuel.; and the difference between the amount received or made as shown by the report and the amount of coke used for bench fuel is 3645 tons still left after deducting the bench fuel. I find from this record to offset line number 1041 receipts for coke per tons sold $7.13. I deducted the coke used in the water gas generator from the total amount of coke made, I took the coke used in bench fuel and water gas generator from the amount the company say they received or made. My exhibit "292" shows what I did. Asked what I did with the balance of 3635 tons, I would say there is not any such balance. Counsel only allowed me to subtract one of those and it left the company net amount of coke of 949.15 tons. The other entry of coke used besides the one we have referred to in line No. 2236 bench fuel, is in the water gas making department, in line No. 1101 generator fuel 2698.18 tons of coke that the company has charged up at
1613 $14,000.00. Deducting it you get 947.15 tons net of coke. That whole process was to get at generator fuel that had already been paid for in the form of coal before the coke was made. I have been trying to arrive here at the way I did arrive at the net amount of coke made by the company in its operation,—that is shown in my exhibit "292",—that is, it made enough as I understand the report, to provide for the bench fuel and water gas generator fuel and then for some 947.15 tons of coke left for sale in that year. The balance of the coke between the two items I say was used and which gives a balance of 947.15 tons, whether I figured that at $7.13 a ton,—it was 947.15 tons at $7.13 and amounts to $6753.18 as shown by my exhibit "280", that is what I did with the remaining tons of coke. Coming back to the original proposition this exhibit

of mine purports to show what the records of the companys show with respect to gas making materials and labor, and being asked to show what this record shows with respect to coal carbonized, enricher bench fuel and all other items of material entered,—I would say I went by the United States Supreme Court record, that is, the record I have a copy of. As entered in that record the items shown are coal carbonized 7098.57 tons for the year ending December 31, 1907; the amount in dollars is $5,966 per ton amounting to $42,844.46; and enricher $178.41; with reference to bench fuel 564.56 with no other words after it which I probably took for coal. I would have to change my mind by looking at another place where that figure occurs with the word attached to it; between lines 1001 and 1002 there are figures 5644.56 which probably means tons of coal, which I can confirm by looking at another place; then, there is entered underneath 498.49 coke all stated at 5.50 amounting to 5347.42 and there is also the word breeze there entered without any figures or
1614 quantities unless it be that a part of 498.49 was 'breeze'. The dollars as result of bench fuel was $5347.42.

The next item in the way of material shown in that report is 4143.82 coke at $5.00 under coke residual is the amount $20,537.73; also under coke residuals it shows 443.63 at $1.00 and something following that I can't make out, I suppose that runs in the $20,537.73 before mentioned. I think the $20,537.73 is opposite the item of Breeze.

The next item is Tar 574.13 and opposite that is the entry $1248.26. Those items are footed into the total residuals, I am reading all the items before me in the record. The water gas tar residual comes in as a part of the material, there is nothing here in this record, it may be somewhere else. The total residuals is $21,785.99. To get the total residuals I would not necessarily add to that the water gas residuals from the plant. I don't agree with this statement here about residuals at all. These are company figures I am asked to read, not mine. Item No. 1104 says water gas tar residual account 45,809 and then .02, which I think means at 2 cents, and opposite that is $916.14. I take it that is tar residual from water gas. Whether the total residual amounts to 22702.13, I haven't that figure before me. In my report I show Coke, Breeze Coal Gas Tar and Water Gas Tar residuals, four items shown, but not in the amounts shown here as I have read from the record.

The next item of materials after bench fuel, well residuals come after bench fuel, and I have just gone over that. Following that the next item of materials is the net cost of coal gas manufacturing materials in line #1009. Steam for coal gas is in line 1014 and comes down a ways below residuals. I see no items of material between the residuals and steam for coal gas. There is no item of
1615 material between residual and bench fuel the bench fuel comes next above the residuals; and steam for coal gas come next below residuals. The amount of steam for coal gas is stated in dollars at $1649.97. The next item of material is purifying materials $389.13; that is all the items in the coal gas account as stated in the report

Turning to item of water gas materials in the record the first item is steam for generating water gas $4183.74; the next item is generating fuel, coke 2698.18 tons entered st $14,491.19; the next item is enricher 495024,—I am not able to read the dicimal, at .042, amounting to $20,623.74. I think there is an item of steam for water. I haven't come to it yet.

The next item of materials for water gas is water gas tar residual account 45809, and following is .02, and the entry of $916.14; and steam, this is in the water gas account, the only word is 'steam' with an entry of 880.78; then purifying water gas material against which is entered $392.04.

I was looking to see whether there are any other materials there; here are items of Work's Expense, Supplies, $1662.97, that appears to be on its face a mixed item; it is in the water gas department, well enough may be labor or gas materials or both, I have forgotten which column I put it under. I might put it under either; it is too indefinite to classify.

Going back to the coal gas department for the labor items we have retort house labor $5,108.18 and I find an item of retort house expense which might be either labor or materials which was entered in the material column for 201.54; it is entered in the report $201,54, and so copied by me. I copied the total retort house expense, that is, I made a summary of materials and labor separately, and I put it in the summary of materials although it is uncertain under which one it goes.

Then the purifying coal gas labor, I find under coal gas here $386.68; then the next labor item apart from repairs is
1616 sundry of labor $1003.51; that is, coal gas.

The work's expense and supplies is 878.50 for coal gas; then here is set down an item for general supervision of coal gas, which I did not include in my total of the labor, the item is $1052.67. It is included in the company's total but not mine. It is not in my classification. Gas making labor of the manufacturing department of water gas is $3737.66; and the next item I find is purifying water gas labor $799.10, a general supervision again which I did not include in the work's expense labor; the next is labor, that is the last one I find here is $2,266.18.

Now under water gas generating house expense $24.03 I find the item and notice it in taxes, but it looks as though it might have been a repair item and I may have so used it,—no I didn't, I assumed it was not and put it in the cost for material, that is, $2403 water gas generating *water gas generating* house expense.

Now, the items are the same for the total amount of labor for purifying labor, coal gas retort house, gas making labor, water gas and labor, according to my tabulation is the same apparently as the amount shown by the records I have referred to, and the total I make to be $14,201.31. The total in the record you would have to add it up. The total amount enricher for water gas as shown by the record, of the materials there is shown to be $20623.74. The bench fuel charge which counsel has said is $5347.42, but I haven't accepted that. That is the amount set down in the record. I had

it before me and I left it there. The amount of the generator fuel, water gas is set down in the printed record at $14491.19; I suppose that is what the record of the company shows for that year,
1617 that is a part of the company's testimony in the case. For generator fuel I have entered nothing, I have dropped out that $14,491.19. The amount of coke residuals as shown by the company's record before me is $20537.73, which includes, as shown by the record, the Breeze residuals; and for those two items I have entered in an exhibit "280" for coke residuals $6753.18 and for breeze residuals $1109.08, but for the same quantities, I have taken what I believe to be the actual residual quantities of coke from the whole manufacturing operations. I have not taken what the record shows as the amount of residual coke, as to the amount of credit that was given the plant on account of coke residuals.

1618 Now as to the coal gas tar residual the record shows there was a credit for *aht* account of $1248.26, and with respect to that item I have entered a credit of $1,607.56.

Now I have the total of the labor and materials for the year 1907 as shown by the company's exhibit for materials and labor making gas per reports of the company, the total of which is $90,615.01; I have the total in my exhibit "274" for materials and labor at $90,615.01; I set the company's item right down as far as accepted them and added them up, of course you understand the credits are not in that, my total residual credits for the year 1907 is $10,386.00. I have in connection with that in my exhibit "299" the amount of labor and materials less residuals, which is $80,229.01. I don't remember what the records of the company show as to the total amount of materials and labor less residuals for 1907.

The criticism I make for the amount for labor and materials for 1907 lies wholly in the manner of handling the residuals. Whether that difference results in a difference of about $5,018.09 in the way I handled it and the way the company handled it,—I will say that I don't remember what it amounts to, it amounts to that as far as I know that is the only difference; and there may be a difference in the addition somewhere, but the only difference I have attempted to make is the difference in treating the residuals. By the same method and on account of the same items in the company records I get a difference for the years 1908 to 1912 inclusive; I have treated the residuals uniformly in the way I have indicated for 1907, but I haven't attempted to change any of the labor and material expenses, excepting that I have left out the charge for supervision all the time as a part of the labor expense at the works making gas. I haven't treated the supervision as a part of the labor and materials in making gas, I have classified it under another heading. I put it under the heading of general expense.

1619 For the items of salaries, office, distribution and general expense for the years 1907 to 1912 inclusive, and for the year 1907 I have offered a tabulation showing that those items should have been $24,214.41 as per my exhibit "341". Asked to refer to the record of the company here and show the items going to make up the amount entered in the record covering those items

of expense for 1907,—I will say I can shorten this a little if I read off on my sheet here, on which I have copied what is in the record. I will read the amount I find in the record under the headings, the amount in dollars covering these items of salaries, etc. for 1907 are as follows: reading meters $952.10; collection clerical salaries $5,355.20; collection office expense $770.14; delivering bills $176.26; outside collections $709.63; general clerical salaries $394.80; general office expense $478.25; executive salaries $3,215.52; general supervision coal gas $1052.67; general supervision water gas $2084.52; promoting new business $13,394.04; total salaries and office $28,583.13; street department expense $797.48; meter department expense $458.60; gratuitous work $1,891.53; legal expenses $2,160.31; incidental expenses $1,723.38; rent collection office $634.42; rent executive office $664.04; total above expenses $36,912.89; that is the total as shown by the record for those various item- mentioned. I have allowed $24,214.41 in 1907, for the estimate of salaries, office, distribution and general expenses. Referring to exhibit "341" I find the company's records show that the amount expended by the company for those item- in 1907, the reported expenses of the company showed $36,912.89 so that $12,698.48 is the difference between those items, I didn't subtract the difference but it is the difference between them.

Referring to exhibit "285" and being asked to state what particular items in that exhibit of the record of the company I reduced,
1620 eliminated or in any way changed,—as previously testified I am not able to make the reduction item by item. I haven't carried the study of the actual labor the company charged under those items to a sufficient extent as to be able to do that. The item of promoting new business of $13,394.04 it looks to me would suffer a large reduction but I am not going to testify what reduction I would make without further study because I don't know enough about what the company charged under that. Taking just the single item of reading meters, I don't think the item of $952.10 is excessive.

On the item of the collection clerical salaries, I don't know the number of clerks they have in the service, I don't remember if I ever knew. The number of clerks necessary to transact the business of selling gas and getting the money would have a good deal to do with the item but the number of clerks the company has to sell appliances, etc. wouldn't have anything to do with it. I haven't any precise idea whether that item of $5,355.20 is excessive, because I don't know what services were performed for that $5,355.20 what you have charged and how much should be charged under some other item. I doubt very much that it might be an entirely proper charge. It is conceivable that the company might charge enough to calling it collection clerical salaries properly to the amount of $5,355.20, there isn't anything hard and fast about the items that may be charged in those three ways. There isn't anything in that that would indicate to me what the service was, it might contain the secretary and particularly the manager, it might contain supervising or bookkeeping, you might write it in that way. In Massachusetts the secretary stays right there and tends to business and draws

a good salary for doing that. Whether that is regarded as a clerical salary,—I don't know what is in the man's mind. And not knowing that I wouldn't want to criticise the item standing entirely
1621 be itself, but taking it in connection with 19 other items I do criticise the bunch.

Collection office expense $770.14 that may be entirely unnecessary in view of the $5,000.00 item that just preceedes it, I don't know whether it is or not, I haven't any opinion on it at all.

I have not been here in the company's office since October 1912 making this examination, but I have been in the company's office a moderate number of times since then. To say that I criticise the accounts collections, clerical salaries without knowing what is included therein, or without making any effort to ascertain,—I say that is not a fair statement of my position at all: I criticised the total of this bunch of 18 or 19 entries which amount to $36,912.89, it is too much, for attending to the clerical management and office business of that company, but as to setting here and guessing at what the company has chosen to charge under those headings I am not going to do it. Asked whether I wouldn't know that was too much if I didn't know how many items went into that total, I say it don't make a particle of difference how much the company separates its items, the question is what departments of the work of the company was actually preformed for that $36,912.89, of the names the company tacks on it don't matter one way or the other. Under this heading I have the general supervision of the water gas department. I think I know what the classifications of Massachusetts would be with respect to general supervision at the plant; under the Massachusetts classification that would be included in salaries, etc.

I noticed in this Lincoln company in these items of salaries, office expense, etc. that they included the item for promoting new business, I took particular notice of that $13,000.00, that was big enough so I could see it even. I haven't eliminated the expense
1622 charged under any one of those particular items, but if I were to assume that the company actually spent $13,000.00 hustling around trying to get new business and that was what all the $13,000.00 went for I should certainly eliminate a great part of that item, most all of it. There wouldn't be a very large item expended on that account, it should be pretty small. I would allow a fraction of one cent per thousand or less than that for new business. Whether as a result of that new business expenditure any new business had been acquired, that would be an interesting fact, but I should not be able to justify the expenditure because it had resulted in some new business; then too even if the company had all of this money as it has had from the consumers here, it wouldn't necessarily follow that the company had to spend it again and keep on spending it over and over. If I knew for that $13,394.04 that the company had actually acquired a large amount of new business and being asked whether I would throw out the expense anyway, incurred in getting it,—I would say I am not affecting this expense and I haven't thrown it out. I don't care whether the company got a large or small return for that $13,000.00 or whether it has got to go on mak-

ing expense of that amount in all of these years for rate making purposes I don't think it has, but if the company wants to take that out of its own pocket I have no objection. Under the company's method of doing business the increased consumption of gas doesn't seem to result in a benefit to those who are consuming and taking the gas. Leaving this company out and as a general proposition down in Massachusetts with a reduced rate when the gas output goes up for a couple of years they run along together. Under a situation of that kind I don't think the company would be justified in spending money to get new business, I think the company would in-
1623 crease the business faster to reduce the price of gas rather than spend the money getting new business; that has been my observation as an observer and student of gas affairs, and accounts and operation of gas companies, and some as a consumer of gas, I live in a town where the gas rate is high, and I am more economical. I really have forgotten the rate in my town, but somewhere near $1.50, I think that is the rate. Asked whether I haven't had time to get that rate reduced,—I would say I am going after them later, there is a good deal of kicking about that rate and people are talking to me to have something of the kind done, but I told them I was busy at present and that is a small town with a few million feet of gas per year. The amount of gas consumed has a great deal to do with the price. Assuming that if the company should spend some money to get new business it would result to the benefit of those taking gas I would say that hasn't worked out here that way, because the company has placed the money in its clothes, and they parted with it and the gas rate is double or thereabouts, and no reduction has come from it. Asked w-ether I think the history of this company justifies that general statement and whether there isn't about as much truth in it as in some of these figures I will say I am talking about the recent history of the company, I am not criticising back in the early days; they reduced the rate and they got an enormous expansion and I have an exhibit that shows that. As to when the company put in the new business department and began spending the money to get the business, I don't know precisely I notice in these sales of 10 years I have an*a*l*i*zed the general expenses that although the out-put has greatly increased down to 1912, this expense is 50% greater than before that per M feet. I have taken the same items from 1907 to 1912 and the company's expenses under its own items is 50% more in 1912 then it was in 1907, under my summary of the company's items. I have taken them out the company's own books and added them together
1624 for 2 years and for each one of those items I have made a computation or a long series of years here.

Referring again to this item for promotion of new business amounting to $13,432.41 I did not say that the item had been increased 50% per M feet sold. I said that group of items in which that is found had been increased 50% since 1907. I mean by that the group of the items I read from exhibit "285" the items are all the same in each of the exhibits. I mean to say that the expense per M feet sold since 1907 has increased 50% for that entire

group of items, as I have denominated them in exhibit "285", all expenses except materials and labor-making gas, repairs, renewals and taxes, I put it all under the same heading each year. That is I have put into the tabulation the company's same items for each year, I have taken just the same items each year from the records and added them up just as they appear, and they are 50% greater in 1912 than in 1907.

Concerning whether I said I was not able to make any specific deduction from any particular item because the classification being too general I couldn't tell what would be included in that particular item,—I said I didn't have sufficient information as to what the several items were it included so I would be safe in criticising to the full extent the line of items as they appear. I do criticise the new business item as all together, all together if it means what it says new business.

Whether on the item of executive salaries of $3,215.52 I wouldn't be able to offer any criticism because I wouldn't know what would be included in that item. I say I wouldn't know what value the company received for that $3,000.00 if any.

Whether that same would be true of the item of general supervision of water gas, coal gas, clerical salaries, outside col-
1625 lections, collection office expense, collection clerical salaries, and whether I wouldn't be able to determine from the reports under any of those general headings whether the items were proper or not because I wouldn't know what services were render- with respect to those matters,—I would say I could make an approximate estimate about those different items, the trouble lies in the uncertainty, I know some of the items taken to cover that class of service that all must cover is altogether to- great. I could criticise those items to some extent as they stand without knowing something more than is shown in the classification itself, but for the full criticism of the bare individual items I should want to make a further study. They are not sufficient in themselves to explain to me what service has been rendered under any one of those different items.

Whether I experienced some difficulty in studying the records of Massachusetts,—I would say we avoided that difficulty by doing what I have done here, taking the information and range of service in a certain department of that business and adding the averages there together. Taking the classification of accounts of a number of gas companies in Massachusetts upon which I have based my opinion here I would not be able to accurately tell from that *that* classification what service had been rendered under any one of those accounts, as to what would be a proper amount to put into different companies for these items here in this report. I did not get from that report any substantial different information than I can get from the company's report here as to what is included in these different items. Whether I can get enough information from this report to criticise and say whether it should be more or less,—I would say to criticise a particular item covering that same class of work you have got to get the class of items covering the same

service. I think to get the class of items for companies mak-
1626 ing gas in Massachusetts that of expense, except materials and labor is shown on that expense sheet which consists of 30 lines printed. The first one is coal; 2 is enrichers; 3 purifier materials; 4 water; 5 wages at works; 6 repairs and maintainence of works; 7 renewal of plant (including retorts); 8 apparatus and machinery (station tools and appliances). To know how much expense a Massachusetts company reports under the head of station expenses we look to see what they report. This report purports to be a copy from the little town of Taunton and being asked to state from that item #8 whether supervision of the plant, water gas plant and coal gas plant, is included in the expense "station tools and appliances",—I would say there is no supervision included in that. I know that from my understanding of these accounts and study of them. I got it right from the account itself, from the tools and appliances under station expenses. Station expenses as shown in that report says for the manufacture of gas. That refers to tools and appliances at the station and no other expenses than tools and appliances.

Now for the distribution of gas in line 10 wages for clerical labor in this department and salaries or commissions of collectors,—I am asked to tell from that item the extent of services rendered for the amount I find in the item. I would say in taking that item separate they have combined them together as I have in my exhibit in this case. I don't know the extent of the clerical labor nor the salaries that are paid under that particular item; it is in just the same situation as were all of this company's items. I have not said that these reports told me of the division of labor and materials, I understand the details I got there and here.

1627 Taking the item #11 repairs, renewals and maintainence of mains and service pipe, and line 12 distribution, tools, and equipment including expenses of horses and wagons and automobiles, I don't know that they have automobiles connected with gas plants they probably do but nobody is criticising for having them if it is a necessary expense, it is a legitimate expense. Asked if I criticised line 13, repairs and renewals on meters, and line 14 gas stove fixing, repairs and renewals I don't even criticise this company for handling gas stoves, it can handle all it is a mind to, I never said they ought not to have gas stoves in stock. Any other company that I compared with this company with all expenses I have used as a basis includes all of their expenses on gas stoves. I didn't eliminate all the expenses for appliances in stock, I didn't do anything with it; I didn't include the gas stoves as a part of this company's plant. I didn't include the appliances in the gas plant or in the working capital. I don't deny that the company owns them and in owning they should if they don't charge them to the consumers.

In item #15 lighting and repair street lamps, item 16 lighting and repairing materials used for other lamps; for office expenses and management; line #17 director's allowances; 18 salaries of officers; there isn't anything under that item to tell how many

or what officers, and these items don't disclose that, but other parts of that report do, I say again that they don't disclose what the men do that get that money. Line #19 other general salaries, that discloses what the items for that expense were but not precisely and absolutely. Line #20 rent of offices not owned by the company; 21 repairs and maintainence office; 22, general office management expense; I say the general character of what is included in that is indicated. This shows an expense of $2,679.12 and I would take and add the items all together as we have done there, they
1628 have men engaged to annalize the company's accounts down there.

Now for miscellaneous expenses whether I know what would be included under that as shown in this report, I have included whatever it is, I have included any expense that I have compared with this company's expenses. There isn't anything to indicate what this $162.87 is for.

Law expense is #24, Insurance #23, fire and employers' liability; 26 is claims; 27 bad debts; 28 incidental expenses; Whether there would be anything under the head of incidental expenses that would indicate to me in that record just what this company spent for that I would say sometimes they put in a sub-heading and sometimes they don't, it doesn't matter if I don't know. That is the method I have been taking as coming from Massachusetts. As to whether I can understand that classification and criticise and act upon it when I am not able to offer a criticism of the items in the report of this company,—I would say I think I can criticise the classification of this company as a whole, and that is the way I have made my comparison.

Asked to point out in this exhibit here which I presented where it says opposite line #18 salaries of officers, where there is anything in this classification of what is included under salaries of officers than would be in subdivision 18,—I would say lists of officers other than directors President W. C. Davenport, Taunton, Massachusetts; I am reading from this report of the Taunton report of June 30, secretary W. T. Soper, treasurer Walter T. Soper, salary $3,000.00; that is the salary list of the officers. Whether that is all I know about the salaries or what would be included under item #18 salaries of officers as shown in that report,—I have my general knowledge on the way the business is done whether my general knowledge would be as good as the station where I have this report that gives
1629 me the general classification of the accounts and I have the records of the company that shows the actual money that was paid out so I could take each one of those accounts and check back to every dollar paid out,—I would say I have had no trouble in annalizing this company's accounts. Possibly in this account the books of the company show why that money was paid out and to whom, but I would like to confirm that. Down in Massachusetts with this record in the investigation of particular companies I had the accounts beside me to check it up against. I don't think my time would have been better spent to annalize these accounts and trace back what the money was paid out for rather than brin- here a re-

port from Massachusetts of general classification without any knowledge back of it,—because we know what is covered by that classification. Asked if I know what is covered by their classification why I am not able to take the item of collection clerical salaries amounting to $5,355.20 and offer criticism or approval of it,—I say because we don't know just which of the items are under item 18 or 19 headings; That covers the class of labor; labor, general office expense and management of the company; we don't know what the company has tucked in with nobody to control it and the company does as it has a mind to about it.

I can take the books of the company and check every dollar that goes into that $5,355.20, there is no reason why you couldn't but when I find the company is charging two or three times as much as other gas companies are charging for that group of items, as long as it is getting it tucked in there and is getting the money out it isn't necessary. So I prefer to criticise,—on that section of the account, general office,—the whole account rather than put my finger down on any one thing. I haven't criticised the manufacturing account;

1630 the company has to hire its men and it pays in the market for what they are worth, it pays for its labor and the price of materials, but when it comes to the officers they can take what they are a mind to out of the treasury for office expenses and clerical help. Office expenses, clerical help and officers might have advanced a little for individuals since 1907, but with the rise in the out-put of gas it ought to shrink, experience shows that it does shrink. Whether this item has advanced since 1907 I say no, per M feet sold it is less. Being specifically asked whether the amount the company has to pay for help in its office in my opinion has advanced since 1907,—I say I think the officers must have advanced for it has gotten up to 31 cents where in 1907 it was 20 cents; I think the labor and salaries for help in the office has advanced a little since 1907. It might be a moderate amount of advance; it does show up very particularly in a number of those records I brought in from Massachusetts. Whether I went a long way from hom- to get to records in this case,—I didn't to get the gas manufacturing account down at the plant, that didn't advance very high. Whether that was on account of my adjustment of the accounts I will say I have taken some items that are high.

I am acquainted with Prof. Beemis. I don't know whether my view would agree with him on this item of new business as to whether the company was justified in incurring that expense in order to get that business. Witness having read to him extract from Prof. Beemis' testimony taken from the Supreme Court Record and being asked if having in mind the idea Prof. Beemis had of the item of expense of new business of this company, and having his view before me, would I still criticise the amount of money this company spent to get more business,—I say I certainly would, and I suppose that Prof. Beemis must have been speaking without having the facts before him, it was in 1907 when this whole group of items amounted

1631 to 20 cents per M feet sold and now amounts to 31 cents per M feet sold. I was speaking about new business but as to what that did amount to in 1907 per M feet I haven't gotten that

item divided. Coming back to the new business expense for 1907 Prof. Beemis had before him the amount of sales for that year and witness is asked if they were not 179,366 M feet,—that is right. And the cost of the new business was $13,394.04; I haven't figured how much that would be per M cubic feet. Asked if that wouldn't be 7.46 cents I answer I haven't figured it. The amount of gas sales for the year 1912 was 234,386 M feet; the expense of the new business department for 1912 was $19,692.64 as to how much that is per M feet I would say I haven't figured that and don't know whether it is 8.4 cents, at this time when I am testifying I certainly would still criticise the money expended in the new business department. I haven't said that I wanted to clip that all off, I said that it would have to be greatly reduced; I also said for the companies in Massachusetts that I figured in all the new business they wanted to have and pay for, I haven't cut out a dollar. You can not take this report from the Massachusetts and precisely classify the expenses incurred by *those* company for salaries and office expense as distinguished from distribution and general expense, but you can separate the expenses, you can not do it precisely but you can approximately, I specifically testified on my direct examination that I based nothing on that division that I indicated for convenience, that the total was what I relied on. I offered an exhibit classifying the very expenses from the report I have here from Taunton for salaries and office expense distribution and general expense in two separate items, and at the same time said that there was not particular importance attached to that division, I merely set it down the*ir* for convenience. I did not present that division and so testified, to show that this company was paying more than it should pay for salaries and office ex-
1632 penses; I did not present it to show that they were paying too much for distribution and general expenses; I drew no conclusion there illustrated. I didn't exhibit it as a proper classification of those two accounts, I said I set the accounts down that way as a matter of convenience, when I began this tabulation I thought I might be able to get the information in that way that would — of some value, but later concluded that any classification attempted to be based on that division would not be satisfactory and I didn't base it on that. I did not say it would be of no value, I say it might be of such questionable value that I haven't attempted to base any value on it in this case. I simply took the total of the items, and that was made very clear on my direct examination.

I don't find any item classifying general supervision of coal gas, general supervision of water gas, in the Massachusetts classification of accounts; we don't classify them that way. I would know where to find that item in these accounts, I would know where the labor pr*e*formed, indicated by those two words would be pr*e*formed; I would know it would be pr*e*formed in several items. Here under salaries of officers or general salaries ordinarily. It might possibly be slipped in under general office and management expenses. It would be very unusual and improper to put it under miscellaneous and incidentals. I have added those all in the comparison. It would not come under station expenses, notwithstanding the expense in-

curred in the station it isn't intended for that at all. This copy of the report submitted by the Taunton company for 1913 is a copy of their report, and has the date on the cover. On page 7 of the return is a column headed depreciation, and there are the credits during the year meaning any depreciation the company charged off from any of the physical equipment shall be there written down, or any other credits for what they may sell or what not. It does
1633 not mean covering the general item of depreciation on that property. There is nothing in the repor- that indicates that it does cover the general item of depreciation on that property; it is my general knowledge of the thing and the business in Massachusetts that tells me it does not cover that. I don't mean to say that it only carry-s in the item of depreciation such materials as the company has disposed of in the year; only such changes as the company of its own volition chooses to write down without any control on the part of the Commission. It is not charged as a part of the operating expenses in the section my attention has been called to.

In addition to that item of depreciation on the general classification, consisting of 30 items containing the amount expended for repairs and renewals, as those items are taken care of by repairs and renewals,—I am asked if I find in another portion of the report an account set apart specifically for depreciation.—to which I reply if any, in many of them you won't find a dollar. I never said that the Massachusetts reports carried the item of repairs, renewals and depreciation as one item. Often times they do distinguish in Massachusetts between depreciation, repairs and renewals in the actual operation of the company's property. The report does not require them to do it. They can do just as they are a mind to. I said in basing my knowledge of the Massachusetts reports you could not segregate depreciation from renewals; for repairs and renewals together you can. I say that the repairs and renewals as separate parts of the operating expenses of the company does not appear there as a part of the operating expenses.

I wouldn't attempt to say that there is any item in this classification of street department expenses, meter department expenses, gratuitous work; that corresponds in this company with what I find in the Massachusetts classification. Being asked where I
1634 would put those items in what particular class of items,—I wouldn't attempt to say there is any item that exactly corresponds with that, I wouldn't undertake to put them anywhere. You can take two classifications that go to different bookkeepers or different men, and the classifications often have the wording exactly the same and the two different bookkeepers will enter different sums for the same work in different places; it is impossible to compare them and say that the same items were put in the same way by different bookkeepers, even if the classifications they were using were just the same; for I know from studying these reports and other documents in connection with the Massachusetts business I find there under different general purposes they get items of the same kind charged differently in different companies.

For the years 1908, 1909, 1910 and 1911 I pursued the indicated

classification as of 1907 right through the accounts of this company; and my criticism with reference to these accounts for those years would be of the same kind as in 1907. My knowledge about the particular items of each of those accounts for those years would be the same in kind about as the accounts of 1907.

Whether I have eliminated for the accounts for salaries, office, distribution and general expenses for 1912 something like $44,818.67 from those accounts,—I don't remember the amount my estimate differs from counsel's statement. I didn't assume for my purpose the amounts shown in the books of the company as the amounts that they actually expended on those items. If any such expenditure was made I criticised it as being too large; too large by over $44,000.00 if that was the difference between the amount I say was reasonable and the company's statement. With respect to that particular year where I eliminated $44,000.00 if that be the amount, from the operating expenses of this company on account of salaries, office, distribution and general expenses, and
1635 asked if I am able to get an item that constitutes a part of that $44,000.00,—I say the concrete item of salaries here, collection clerical salaries $6,975.16. The executive salaries amounting to $8,917. and general supervision of water gas amounting to $3,554. is too large a salary for the management for supervision of the company to the extent indicated as near as I can tell. Thetake the new business management that is too large. I haven't prepared to scale down the items each one separately, but I have mentioned some. Whether I criticised them but can't tell how much they should be reduced,—I can look them over and on consideration reduce them a considerable amount; I haven't done it, I can't do it on the spur of the moment, I don't want to deal with them recklessly. When eliminating the item of $44,000. out of a total of $72,000.00 and asked if I did not have time to pick out some of the items,—I looked it over and I saw those items were longing to pick; it wasn't necessary how much I should take off of any one of the 19 items that run it up to $72,000.00 for the general office expense to manage it and pay the general expenses. It includes more than the general expenses, it includes the distribution expenses, but not the repairs distribution expense that is a repair. It includes all of the expenses connected with the distribution department consisting of more than half of the property of the company, except repairs and renewals, it includes all the other expenses connected with the distribution of gas in this city. The distribution system constitutes a large percentage of the total percentage of the company's property. I don't know what the exact amount is whether 60% or not. Whether I made a horizontal cut or not, I have denied a good many allegations made here, I don't think I will deny that; I don't consider that exactly a geometric method of dealing with it. Counsel is welcome to it if he likes it that way. I think the reply
1636 on the size of the executive salaries for 1912 gives an indication to some extent of what would be included in that item. I think there was included in that item the salaries of some persons who are supposed to aid the company in managing its business.

With such a heading as that it would often include all the salaries of the general manager and president. That would be George Montgomery and the secretary, one man would very likely hold the combined offices here, he does in many of the Massachusetts companies. I think in this company the general manager and secretary are two different persons, and some more. Whether the salary of the superintendent of the distribution system would be included in the executive salaries,—I would say if the general manager did the work of the superintendent of distribution, except what was done by the foreman which is the case in many cases, they don't have a separate superintendent of distribution. Whether it would include the superintendent of the plant, again I say the general superintendent or manager of the company would often do all the necessary superintending of the plant outside of the good gas works foreman who would stay at, and have his wages charged in the wages at the works. I don't tell what is included under that heading as to how many officers and who they were. I am telling the class of service such an entry might fairly be expected to cover; but just how many persons the company has included under that entry is a matter within its knowledge and not mine. It might include the amount paid to the directors for their attention to the company's business, and often times does. It isn't a very large amount and it could be put under executive salaries very well. I don't think I would be inclined to criticise for a company of this size the $8,917.30 as an excessive amount for the general manager, secretary and superintendent of
the distribution system, superintendent of the plant and com-
1637 pensation paid to the directors. Whether I would know whether to criticise it if I didn't know what it covered,—I would say only in connection with other items, when you see $72,000.00 written down there, there is a pig somewhere. That $19,692.64 is one of the pigs. That is for getting more business, that is the way the company labels it, I don't know how the company let go of that $19,000.00, it could hire a lot of solicitors on it. Possibly I could find the pig by checking the accounts, but the company's accounts are not particularly easy to check, counsel might be able to do it.

I notice Mr. Lea's exhibit showing the number of house services and the number of meters in use and the sales of gas from 1873, following section "O" in his report; and notice the line showing the sales of gas in this exhibit beginning with 1872. I notice that line starts off in 1899, I don't know that the increase in sales of gas in this city took place after the new business department was put in. I don't have any record of the company's dealings until along in 1903, near the end of 1902. I have no information that the new business department was put in anywhere around 1899 and don't agree to that. In 1902 as shown by this exhibit the sales of gas were about 78 millions. In 1912 234 millions. The population of Lincoln in 1902 was a little over 40,000; in 1910 it was about 44,000,—44,146 in 1910,—and 49,000 and something in 1912 a gain of 3,000 in population and the sales of gas increased from about 80 millions to 234 millions. And from 1873 to 1902 the company had only pushed

up its sales to 80 millions; that is a very common record, I have got this for a great many companies. I think it is evidence that the new business department put in by this company in 1900 had something to do with getting people to take gas; I never suggested that I didn't think so. I should have to say that I think that some portion of the
250 million feet which the company is selling now is evidence
1638 that it is due to the money expended in the new business department, I never suggested that I didn't think so; I think it was a factor. I don't know what proportion of that increase I would attribute to the money spent by this company in its new business department. I could arrive at a rough estimate of the amount of that increase that I would attribute to the money spent in the new business department, but I haven't done it. I would say from the history of the company back of that that a moderate proportion of it was doe to the activity of the new business department. If you take the increased sales *the* come to this company as a result of the expenditure of the new business department I would want to give the benefit of those increased sales in the reduction of the cost of gas by eliminating the expenses from the company's record that made it possible to put those increased sales on its books. I say it is better and fairer with the consumer that they should get a lower rate and that they should get as stimulating the sales than that the company should spend $19,000.00 on new business. I didn't eliminate from the company's books the amount it cost it to put the new business there, I have allowed the company as much for the item of expense included in new business as many, as successful company's in Massachusetts as this company, have spent. As to how much of the new business expense between the 80 million and 250 million I would want to allow this company as a part of the operating expense,—I haven't segregated it; I have allowed the company from 12 cents up to 13 or 14 cents per M feet gas sold; it is ample to include for some new business in addition to the other necessary expenses. I haven't made any compilation in dollars per M to allow for the expense this company was put to to put that new business on its books, if I go back to the time the company had 80 millions of gas, it would
increase the cost of gas per M if I had to base my computation
1639 on the sale of 80 millions. Whether I want to eliminate from this case the expenses this company paid out to increase those sales and get the benefit in the reduction in the cost at the same time,—I would say not necessarily, the expense the company says it incurred I say was too big.

Again referring to exhibit "308" on repairs and renewals, and depreciation and also exhibit- "309" and "310" I would say that "308" has been withdrawn, there is no*t* particular reason why the exhibit should be withdrawn any more than it is going to take up a lot of useless time to compare that exhibit with "309". I have explained how the figures were compiled. I shall not have to ask to have it withdrawn only the figures are not set down to the company in those two places, they foot up finally to $104,000.00 and something. in each case, and it will be a lot of bother to explain the two, they being taken from different places in the gas reports; they don't check

out with my other exhibit on the same subject, but they check out absolutely with the company's gas reports, there is several hundred dollars difference in the final total.

Exhibits "309" and "310" are on the subject of repairs and renewals. Exhibit "310" shows the amount of repairs on the water gas buildings of $486.47; and on the coal gas buildings $210.46, for the year 1903. Exhibit shows the repairs and renewals for the same year. The summary of the two items of repairs and renewals for the heading buildings in exhibit "310" is $696.93, I show it as one item. I show in exhibit "310" machinery, which probably includes coal gas apparatus in the amount of $436.94 and in exhibit "309" I show the summary of that with other items. As I now remember it the machinery items in exhibit "309" are divided as between gas benches, water gas generators and other machines; and I think *it* those items go to make up and include all the items in exhibit "310" under the heading machinery. I don't find
1640 the item general apparatus repairs coal gas $436.94 as a separate item. I find general apparatus repairs water gas in the amount of $418.23 in exhibit "310", and the same item in exhibit "309". I find in exhibit "310" general apparatus repa*ris* water gas immediately following the $418.23 in the amount of $868.42 in exhibit "310". I do not find the item in exhibit "309" covering the same item in that language; I find an item for machinery $1305.36 which would correspond to $436.94 for general apparatus repairs, coal gas and $868.42 general apparatus repairs water gas in exhibit "310".

I haven't got the total for water gas apparatus repairs in exhibit "310", that starts in for another series. It is not added up in exhibit "310" as separate items, that addition wasn't made necessary, it is perfectly plain how exhibit "310" was added up for all the machinery is added together. Whether it amounts to $1286.65, —I don't know, I haven't added it that way. I only have one total in exhibit "309" for the year 1903 and that is $5912.21. I have in exhibit "309" under the heading machinery $1,305.36; and in exhibit "310" I have two items that go to make up that as I called attention to.

Whether for street main maint*ainence* I have $471.92 in exhibit "309" and in exhibit "310" service maint*ainence* $293.00 and meter maint*ainence* $794.28.; with the service and mains added together in exhibit "310" being the addition not carried back into "309",—I would say not the separate items. I don't remember of any distinct purpose in arranging exhibit "309" by bunching the items and changing the arrangement for the same items that are in exhibit "310" and taken from the same record,—except to shorten the matter a little. The objection in introducing two exhibits covering the same subject matter.—exhibit "309" is a summary for all the years from 1903 to 1912 consisting of two pages where in exhibit "310" you have the whole page devoted to the detail entries of one year, it is a process of concentration.

1641 The totals for the second year, 1904, of repairs and renewals as shown by exhibit "309" is $8,544.68; and the same

total is shown in exhibit "311" for the same items and again I have concentrated in one instance the items as they appear on the books of the company, and have combined the items to get the total. Exhibits "310" and "311" I took the items as they lay in the books of the company and abbreviated them to get exhibit "309". Whether in exhibit "309" I show the total amount expended by the company for repairs and renewals for the third year 1905, and the same thing is shown in exhibit "312",—I would say the detail for the year 1905 is shown in exhibit "312"; segregated into the divisions that appear in the books of the company. The exhibit deals only with the one year showing the entries as they appear in the books of the company. Exhibit "309" for 1906 shows the amount expended by the company for repairs and renewals as $11,555.67; and corresponding to that total exhibit "313" has the same item.

For 1907 exhibit "309" shows the amount expended for repairs and renewals to be $12,920.67; and corresponding to that total exhibit "314" has the same item.

For 1908 exhibit "309" shows the amount expended by the company for repairs and renewals to be $8,915.99; and corresponding to that total exhibit "315" has the same item.

For 1909 exhibit "309" shows the amount expended by the company for repairs and renewals to be $9,104.01; corresponding to that total exhibit "316" has the same item.

For 1910 exhibit "309" shows the amount expended by the company for repairs and renewals to be $10,721.04; and corresponding to that total exhibit "317" has the same item.

For 1911 exhibit "309" shows the amount expended by the company for repairs and renewals to be $14,898.14; and corresponding to that total exhibit "318" has the same item.

For 1912 exhibit "309" shows the amount expended by the
1642 company for repairs and renewals to be $11,712.60; and corresponding to that total exhibit "319" has the same item.

And the net result of those items combined in toto I did not think the company was charging enough, or spending enough for repairs, renewals and depreciation. Whether for repairs and renewals standing alone I think the expenditure was reasonable and justifiable,—I should not seg-regate the matter here any more than I would anywhere else. I don't think the company can set up any definite sum as the correct sum for repairs and renewals, that is, I think it is very hard to arrive at any statement of that kind. I haven't arrived at it, but if you take repairs, renewals and depreciation you can get a pretty fair figure. But for repairs and renewals only it is very hard to set a figure: I haven't found any figure for that because of the uncertainty of the term renewals, but not the uncertainty of the way the renewals go along. I had access to certain records of the company, and I found them very bare of information for any specific items that were involved in these exhibits for repairs and renewals for each of these years, and made considerable investigation to see what those items were. I went through a considerable portion of the voucher distribution records,—that is the name the company applies to one of its forms of records,—I had an assistant

going through it, I did only a fraction of the work myself, I indicated what I wanted and started the assistant and he stated the result, and when I got them I found I wasn't getting very much information or light on the subject. That investigation was never completed, and isn't now, I have other records in the company's office that I have in mind that I shall try to complete it which I shall go and see if I can't get some more light. I found not a sufficient amount of detail in 1907 or in any other year of these repairs and of what the money was expended for; I found some information; I found
1643 these entries I have allowed, and I have some addition- information, by going through the voucher distribution records but not as much as I would like, or would think sufficient for a complete an*n*alysis. It is not necessarily as much information as I would get out of the Massachusetts reports under the classifications of repairs and renewals. In the classification here or reports, that I examined in the division of the items of repairs I had a bunch of repairs and the amount for the year 1907.

The buildings repair for coal gas and the amount for 1907; and the general apparatus repairs coal gas and the amount for 1907; repairs water gas generating apparatus and the amount; building repairs water gas and the amount; general apparatus repairs water gas and the amount; street main maint*ai*n*e*nce and the amount; service maint*ai*n*e*nce and the amount; meter maint*ai*n*e*nce and the amount. I had those items and they are quite as specific as any items I have access to in the Massachusetts reports, but there is to be taken into consideration in connection with my answer to the other questions that the Massachusetts reports include a good deal of matter besides the entries about repairs and you can compile the various entries and find out where the company spends the money and where it charged it and get some idea where it was there.

In the Massachusetts report I have a classification, #6 repairs and maint*ai*n*e*nce of works.

Opposite that is set out the dollars expended for that item. There are that on that page to indicate what it is spent for beyond what would be indicated by the wor*k*s repairs and maint*ai*n*e*nce of works.

The next item is renewals of plant, including retorts. Whether I regard that as an item of repairs and renewals why renewals of the plant is a renewal of the plant. There is nothing in that item beyond the amount in dollars set opposite it to indicate what it
1644 was spent for any more than a renewal of the plant. I take it to mean the works plant.

Item 11 says repairs, renewals and maint*ai*n*e*nce of mains and service pipes. Opposite that appears the entry of the dollars; there is nothing else on that page to indicate in particular what that was spent for.

Under item 13 I have repairs and renewals of meters, there is nothing in that item beyond the amount in dollars to indicate what that particular thing was spent for.

Under item 14 I have gas stoves, fixings, repairs and renewals; I don't run that into the repairs of buildings, that is one of the miscellaneous expenses. I didn't run in the lighting and repairing

of street lamps. Standing alone there is nothing on that page of the exhibit that represents the spending of money to indicate anything more than is stated in these reports of the company. Decidedly I say there is something else in these reports that aids me in annalizing these figures. By turning that part concerning the cost of the plant where it recites the additions during the year, cost of plant, lands, buildings, machinery and appliances, mains, services and meters giving the dollars, if any, charged for additions to plant in that way during each year. That is the additions, and I was asked to explain on what annalysis I based it. Now looking at page 7 we will see what has been charged up and the cost of additions to the plant during the year, and you have the amount of money spent and charged to new construction, that is to the cost of the plant; now you will have to look at another page on page 18 under the heading coal gas plant, there is required a statement of the number of benches, and the location of those benches and type, the number of retorts, and on the same page is required a statement of water gas plant, and the location, type, number of settings, dimensions of generator, carburetters, super-heaters and the capacity for 24 hours wrok of that plant; then on page 19
1645 is a description of the purifiers required as to the number, length, width, and depth, and their location; on the same page is required a description of the gas holders giving the location of each and whether open or covered giving the type and dimensions of the gas holders, the date of construction and working capacity of the said holders; on the same page 19 is given a complete schedule of the sizes and length os the cast iron mains required to be stated in that schedule, the length and size of cast iron mains laid during the year; and on page 20, is a tabulation requiring the size of wrought iron and steel mains and the length of each size during the year; on the same page is a statement of the number and size of the meters in use and the number added during the year; on page 21 is a statement of the number of services at the date of the report and at a prior date one year earlier, and the increase in the number of services during the year.

Now take these reports year by year with the information I have indicated on the different pages and see what, if any, has been charged to the cost of the plant and if you have found it see what there is of a substantial increase in the length of mains that has been added and nothing charged to additions to cost of plant for mains that year and which is charged to the reparis and renewals here; it is obvious what has happened, the company has laid some miles of mains and charged them into that account which commonly happens with prosperous compan-s, and the same thing holds true as to the other parts of the plant. In other words we have in that Massachusetts form of report segg*r*egated out and required to be stated each year the dollars of repairs expended at the works; what amount was paid on the meters; and the dollars of new construction charged for the machinery, buildings, mains, services and meters, and then we have the quantity actually added during the year re-

quired to be set out in different parts of that report and by
1646 following those items through and seeing where the charges are made in regard to new equipment,—works equipment and any mains go it,—you can get on the whole, by devoting considerable amount of time following it through year after year, what the charges in the repair account are doing; whether they will extend the plant with the old pieces keeping the plant that was there and is there in operating condition. The operating expenses were taken from these sworn reports, that isn't true of all the data I have given about the Massachusetts companies, but the operating expenses I compared with this company were taken from the sworn reports. I don't show any repairs and renewals of plant in this exhibit of operating expenses that I brought in here that I now wrote at all; certainly not with salaries, office, distribution and general expenses. In other words, the expenses I have denominated all expenses except materials and labor making gas, repairs, renewals and taxes, I specifically cut out repairs and renewals, and excluded them, neither did I include them in making that comparison. I made no exhibit for the Massachusetts plants in which I include those particular things and nothing else, repairs, renewals and depreciation, if I have I have forgotten it. These different things I have referred to on page 7, 18, 19, etc., oor refer to new construction, new equipment, extensions of mains, equipment and buildings. None of the items on those pages refer by me to the subject of repairs and renewals. I am telling what happened. Whether the only classification that I have in the Massachusetts reports that seggregated and refers to the amount of money spent on repairs and renewals upon any particular equipment is upon meters in my sub-division #13,—I would say that repairs and renewals in the case of meters are separated in the dollar charges, so that I have a specific item for repairs and renewals. Outside of that repairs for meters, whether there isn't a classification in the Massachusetts reports that required them to enter a dollar under the head
1647 of repairs of mains,—I would say repairs and renewals of mains go together under the same heading mains and service pipes. You don't know which it is so far as that heading standing alone is concerned, and so far as that heading standing alone is concerned it might by either renewals of mains, services, or repairs on either mains or services, or maintainence of either mains or services. As to what other entries there are that direct me to dollars of money spent in repairs of mains or services I would say this indicates the dollars of money spent in renewals and in addition the new construction is charged as repairs, and anybody who knows how to annalize a report of that kind knows that if you find a company putting in five miles and nothing is charged in the cost of plant ac-ount for those mains, that it necessary went into the repair account, unless the sworn return is a lie and we assume they are true.

I say if there was a $5,000.00 entry opposite the item repairs, renewals, and maintainence of mains and services I could determine just what was done with that money. If no new construction

of mains was shown in this report that would be an abnormal report, and if there was no new construction we wouldn't know, except we would have to suppose that they had some very remarkable kind of reports going on and on those mains. Whether I would have to accept it, I don't know, very likely it would call for a letter of investigation from the clerk, a special letter would come in from the company explaining in full what they were doing with so much repairs; it is very common to find anywhere from one to half a dozen letters attached to furnish to anyone because there has to be a document explaining what was repair charged and what was construction charges and what construction was alleged to have been done. Whether the letters aren't sworn to and I am basing my testimony on the sworn reports,—I would say I might base
1648 it on the information the Commission collects and treats as public documents.

Assuming that they took up a 4 inch main of 1000 feet and put down in place of it a 6 inch main of 1,000 feet and asked what entry in this classification I would expect to find for it,—I would say it would be futile to expect any kind of an entry in that classification because the different companies follow their own sweet will in charging up those matters. You could find a place to light on in that classification in the charges to repairs. As to how the company would charge that in the report I suppose it would depend entirely on the company you happened to strike, some charge it to repairs and some to construction, we have all sorts of companies in Massachusetts the same as you have out here in Nebraska and they treat their accounts in all kinds of ways. We would know what they charged for repairs and renewals and by investigating the rest of the return we could find out what happened to the physical property. The answer is the same as to all of these entries about repairs, renewals and maint*ai*nence on page 8. Whether you pay freight on the repairs and maint*ai*nence to the works as to what was done with the money and how that would be entered, you have to construe the report as a whole. It is just as useless to take a specific entry here as it is to take a single ent*er* out of the company's books and try to build up a conclusion on it without an investigation, without all the other circumstances, you can't tell what the bookkeeper chooses to enter under that. If a coal gas equipment was taken out of repairs and a new one put in whether that would be entered as repairs and renewals or as new construction, I would say of course it should be entered as a repair. Whether I would know how it would be entered if it was one of these retorts to one of these benches of 6's,—I suppose it would be fair to say it would be entered as a repair by most any one who knew anything about mak-
1649 ing bookkeeping entries, but what we recall to in the Massachusetts situation is the charging up of a large amount of new construction in the repair account which is a perfectly notorious and obvious — to anybody that is familiar with 27 years records in that office and where these expenses are reported as illustrated. Possibly that is one reason why I only require so low an amount for depreciation, because so much construction is taken up in repairs

and renewals; you will remember my repairs, depreciation and anything all goes in in one lump; I allowed more for that than the depreciation alone as I estimated this plant figures up. Witness being asked to explain in the company's records the classification for all of this expenditure includes all expenditure for repairs and renewals,—I would say the only classification of this company's that I know of is exhibit "314"; I might add that in the back of each gas report the items are brought together with slightly different reading. I think the substance of the readings is nearly the same, without referring to that discarded exhibit "308" I haven't that exact form of wording, here is the classification actually insofar as the report shows in exhibit "314", and there it is reported for each year that goes into the company's actual expenses report; the other one don't, those entries are taken right out of the company's expense report just the way it reads year after year.

Taking this report for 1907 the classification there shows separate items for repairs, bench repairs, building repairs, coal gas general apparatus repairs, repairs water gas generators, water gas apparatus; build repairs; water gas general repairs, water gas street main maintainence, service maintainence, and meter maintainence, and all that I have taken the additional item of setting and removing meters it is at least partially a repair, it is a necessary item but not all repair.

Concerning my comparison with certain towns in Massa-
1650 chusetts and whether it is important that I should take into account the number of M feet of gas sold in the different towns in order to make a fair comparison,—I should want to know the number of M feet of gas sold in considering a comparison, I don't say you couldn't make a comparison where the amounts were this. That has a bearing upon the cost per M feet of labor and materials and all of the operating cost in connection with the plant, and office expenses and all that. Charges for operation have no fixed sum, you can't run your manager's salary down indefinitely for a small plant, you must stop somewhere, it is true with some other items, but you can't run the rent down indefinitely for you must have a suitable place. I think undoubtedly that the matter of the character of the consumer, the question of the consumption and the conditions under which the gas was taken by different consumers would properly have an effect upon the matter of the operating cost or the price at which the gas could be furnished, but you would have to know what it is in order to give a- opinion you would have to know more about it. Unless the matter of the gas company furnishing a large amount of gas to the city for lighting the streets I don't think that would have any great or marked bearing as an element that you would want to take into account in considering the operating expenses of that company. I don't think that you would have a meter reading, I don't think the gas sold for lighting the street goes to a meter. Whether you would have a very large sale of gas to one consumer where you would be relieved of the expense of meter reading and collection I don't think so you would have collections to make which perhaps at a less expense per unit out-put on the other

hand you might have the labor to lighting and extinguishing
1651 the lamps but the amount to furnish the street lighting is very moderate as compared with the general sales of gas. The city might take as much gas for street lighting as three or four thousand consumers, that accounts partly can but I don't think I care to guess about the street lighting proposition. I looked in the town of Taunton and I didn't find that they sold any great amount, if my recollection is right it is that the street lighting is a very minor matter taken generally with gas consumption but each fact should be taken into account. If the company in the particular town I am comparing with Lincoln furnished gas for street lighting to other companies though that is a fact I would want to take into account in comparing the operating cost per M in that town with Lincoln, selling gas in large amounts to other companies, should have to consider if it is a large enough item to attract attention and would be weighted. It could be produced and sold to other companies at a much large- place than it could be sold to a large number of consumers.

Whether in the first 6 towns shown in my estimate were of Cambridge, Charlestown, Lawrence, Lynn, Haverhill and Taunton and whether of those 6 towns Cambridge did not furnish gas for street lighting from 1903 to 1912 I would say I don't now recall whether it did or not; if they did it was so small in amount compared with its general business that its effect on its general expenses than expenses of materials and labor making gas is repa*ris* and renewals and taxes, etc, it would be very small. I don't recall to what extent sales were made for street lighting purposes. Possibly Cambridge also sold gas to other companies from 1904 to 1912. Cambridge sold in 1912 for public lamps 4,527,000 feet, let me compare that with the total sales and see what a trifle it was; in 1912 they sold 762 million
1652 feet of gas and 4½ million and thereabouts out of 762 went for street lighting that is something over one half of one per cent. In 1912 Cambridge sold 604 thousand feet to another company a little over one half of one million feet.

Charlestown furnished some gas for street lighting. Lynn furnished gas to other companies, they furnished the enormous volume of 132,300 feet to another company that is an item that I would not take into account if I were to compare the companies, that quantity of gas sold would disappear, I couldn't estimate that in the 100 million feet the Lincoln Company sold. I made no comparison that involved the taking into account in the distribution system of the character of the mains laid in fixing the amount necessary for repairs, renewals and depreciation. I have made no direct checked comparison between the result of this company's operation and Massachusetts companies on the item of repairs, renewals and depreication; I mentioned I got a good deal of information about gas companies all about repairs but I haven't set out any tabulation comparing them. I based my conclusion of 9 cents per M feet that was sufficient to cover these three items were largely on what I know of Massachusetts gas plants, not merely what is revealed in certain plant entries in these returns. What influences me with this com-

pany was what I saw with reference to this and many companies, we have upwards to 50 and I have investigated this matter extensively for a great many years for a great number of companies.

I did not take into account on the question of operating expenses the daily capacities of the plants in Massachusetts that I compared with this plant of about the same daily capacity of this plant.

Whether I took into account in the matter of determining whether certain equipment was excessive or should be eliminated because it was more than this company needed,—I haven't suggested that the equipment of this company was either excessive or should be
1653 eliminated. I did make a comparison in comparing the book assets with the quantity of equipment in this plant and plants whose book assets I mentioned. That is the only comparison touching on that I remember to have made between this plant and the Massachusetts plants; that didn't involve the operating expenses at all and wasn't for the same group of companies, it involved some of the companies but there was no comparison on that point in connection with operating expenses.

Taking the town of Cambridge as shown in my exhibit "350" the total expenses for various years; for the year 1908 I purport to show what is shown in the reports of that company for 1908 with respect to all expenses except material and labor making gas; repairs, renewals and taxes, the amount of which is $69,084.00 I haven't shown the cents. I have a copy of the detailed report of that company for 1908 showing the detailed expenses from which I made these deductions. The items in that report which I have assembled to make up the total of $69,084.00, salaries and office expense $50,083.00; distribution and general expenses $19,001.00 making a total of $69,-084.00. The separate items in exhibit "350" are meters reading and collecting $23,734.09; by that I mean the amount entered in line 10 under that heading in the book, meter reading, collecting, I have abbreviated the items the same as the other items, I can pick it out; wages meter takers, clerical wages and salaries in this department, that is what I have entered under meter reading collecting, $23,-734.09. The next item is salaries officers and directors in lines 17 and 18 $8,785.00 I abbreviated that heading I give it salaries, officers and directors meaning to include in that the two items under lines 17 and 18 directors' allowances and salaries of officers. Thes-
items I am now reading I believe go in the first column so
1654 far for some in here. The *The* next item is other general salaries $8,994.36, in my classification that comes in line 19 in the printed form of return under the heading other general salaries. The statement being made that that isn't the printed report used in 1908,—I say I think 1908 has other general salaries; it has something that corresponds to that, I can't change the form of the printed reports, if they — the designation of the items and instead of calling them "other general salaries" they call them "general salaries." That item was $8,994.36. The next item still in the first column is advertising that is probably one of the inserted headings for that year, the companies often insert in pen and ink headings for things that are not specifically covered by the printed heading in making up

these reports. There isn't any such heading in the printed form as advertising, but I am testifying that there is such an item set down as advertising amounting to $1,590.76 which I have here, included in the sworn return of the company for 1908; not being a printed question it doesn't carry a number unless it would be entered under incidental expenses, which like enough it was in the original report; there are several lines left blank that are to be filled in for curious persons to inform themselves, and it might be it was entered there. The next item is general office expenses, that in the 1913 report is line 22 and the amount of it is $6,979.82; now those items I have read so far make up the total of $50,084.03, and those are the ones that go into the salaries and office expense column, although I have stated that I attach no particular importance to the separation between the column salaries and office expenses and the column distribution and general expenses and have hung nothing on it in the testimony in this case. I notice the entry in my exhibit "350" is $50,083.00 instead of this footing including the cents of $50,084.03.

1655 The next item is distribution and general expenses and we are now passing to the next column, "care of street lamps" that would be lines 15 or 16 or both. Whether there is any such heading as that in the printed report,—I say substantially corresponds to that, I abbreviated them, and told you it was 15 or 16 or both, just what form it might take in 1908 I am not sure, amounting to $1,566.58.

The next item is distribution tools and appliances that is line 12, $36.14; rent of offices not owned by the company, only that is printed rent of offices there, amounting to $4,225.81; the next item is insurance $4,491.92; the next item law expense $1,910.54; claims $390.90; meter connections $2,656.28,—that would be something you wouldn't find in the printed schedule, there is no printed entry for meter connections,—that must have been a written entry. I have included that in this classification in the distribution and general expenses and added in it amounting to $2,656.28; stove connections $1,094.72, that would most probably come under gas stoves, fixings, repairs and renewals. That was 1,094.72; fixing gas stoves $2,628.22, that is line 14, I may say in explanation of some of these headings, this being a copy of the original return which is very frequently interlined by the company making out the return and put in additional headings; there are some additional headings here that don't occur in the original return; that doesn't change the matter at all because I have taken the stoves here that ought to go in. I am giving the distribution and general expenses here now, that gives a total of $19,001.00 and here in exhibit "350" it is $19,001. I have not carried the cents into the exhibit. I think that states how I got the amounts in exhibit "350."

As to the amount for incidental expenses for the year 1908 as shown by this report, I have included all the expenses, I have
1656 taken and carried them into my exhibit for 1908. The same as those entries I have given the actual entry from the original

return may have been written in in pen. As to how much I included under item 27 incidental expenses,—as indicated by the original form of return these are blank lines, it is the practice of the company to fill in those with a statement of what the incidental expense *it* and even before than you will find script entries in the returns telling just what the particular item of expense *it*; I haven't in this summary of expense I have given any item that is labeled incidental expense, having preferred to take the exact items they put on there for expenses of 1908 and I have given and classified therefore all in that year except materials and labor making gas, repairs, renewals and taxes. Getting back to the question, I have a script copy of the complete expense report. Whether I have the amount entered opposite incidental expenses on line 27 for 1908 amounting to $5,341.76,—I don't say that I haven't it, it is in the other items I have given but not that specific item under that heading that I have explained. The total of it is spread out over some of the other items. Here is my total expenses for the year, and all that is necessary is to see if it foots with mine.

The item I gave under the heading of line 14 for gas stoves, repairs, etc. of $1,094.72; and the item of $1,590.90 for advertising; and the item of $2,656.28 for meter connections may be a part of the three items which make up the total of $534.76 of incidental expenses, I don't know that I can remember what is in all of those reports; I didn't make all those copies myself but can readily check it.

I didn't consider the bad debts $900.00 in that year a part of the operating expenses at all. In my opinion they should not have treated them as operating expenses, they are not like the income.

They are shown in the Massachusetts reports as operating
1657 expenses. Notwithstanding the fact they are so shown I refuse to treat them as operating expenses, and I believe the company here refused to treat them in its report also. Notwithstanding the fact that the company manufactures and delivers gas and it isn't paid for I don't regard that as an operating expense; suppose the company inserted twice what it cost to make it, if you regard it as operating expenses the expenses are three time- what it actually cost them to manufacture, and what they paid to make the gas, that would be the result of that sort of bookkeeping. As to what I would do with the item of bad debts,—I say if it is a lack of income,—if you sell $100.00 worth of gas and don't get paid for it it makes you income $100.00 less than it would be, it don't change the expense of making it. Assuming that the company manufactured $900.00 worth of gas and it was consumed as they did, and you didn't get anything for it, and witness being asked *out* the company would get that $900.00 back unless it got it back through the sale of the gas to other customers who did pay for it,—I would say that is the only source from gas and residuals. To get it back without charging as a part of the operating expenses the company can charge enough income from the customer's figure the income minus the bad debts and it still leaves a profit that way. Asked whether you could not take care of the $900.00 by raising the rate a little,—I would say

the rate is usually so high already that they have no need of that, the loss and discount usually run far ahead of the bad debts in Massachusetts, I have made that computation repeatedly.

I have given in exhibit "350" under the heading of all expenses except materials and labor making gas, repairs, renewals and taxes on all the items that I have included in the operating expenses of the Cambridge Company for 1908. I am unable to say whether
the company charged anything to depreciation that year
1658 in its report, they charged nothing in operating expenses
to that. I have all the report here. I am unable to say whether the report shows an item for depreciation, I haven't got the complete report of the Cambridge company for those years in all departments; I have a complete report of what they said was a statement of the income and expenses and all the expense side, I haven't got the income side. I have not for 1908 a copy of the report that shows the amount *the* was charged by that company for depreciation and the item of depreciation. I don't know what it is, it isn't reported as an expense. I have a complete copy of what they reported and are required to report as expense by the printed form of report. I have nothing in my total that would indicate any other expenses reported by the company and charged up in its report as "other expenses," for the year 1908; I have the total expenses footed for a total which can readily be compared with this company's if it is wanted. I don't recall an item in the earlier reports under the heading of "other expenses," I don't find it in the 1913 report.

Referring to exhibit "350" to the items for 1909 for Cambridge entered in the column salaries and office expense and the column distribution and general expenses, I have meter reading and collecting $25,488.72; that is the item entered under line 10 in the report as "wages of meter takers clerical labor in this department, and salaries or commission of collectors." That is under salaries and office expenses, I am taking them in the order they are given in that exhibit, the first heading is salaries and office expense, salaries of officers, and directors $8,805.00; other general salaries $7,800.00; advertising $1,365.75; general office expenses $9,972.83; total salaries and office expenses $53,432.30 I have it entered in my
column in exhibit "350" as $53,432 having omitted the
1659 cents. Now passing to the column distribution and general
expenses, so headed, the entries making up the sum in that column are care of gas street lamps $873.52; rent of offices $4,352.50; insurance $4,678.80; law expenses $2,011.48; claims $1,277.91; meter connections $5,686.30; stove connections $2,308.90; whether that is in line 14,—I haven't reported the number out of the expense sheet, the expense sheet as I explained is interlined with separate lining and I have taken the actual entry from the expense sheet rather than the printed entry that had been superseded by the group entries; I do not recall whether that item appears opposite line 14.

Fixing gas stoves $3,165.82; the total of those items is $24,355.31; and the total that has been carried into my tabulation under dis-

tribution and general expenses is $23,481.00; there is evidently a mistake in the addition of some item or some item of about $1,000.00 has been omitted in the tabulation as presented in the exhibit "350" because the amount is about $1,000 less than these foot up to, this exhibit "350" wasn't taken from these sheets I am reading from at all; it was taken from the original records by going over and footing up the quantities, subsequently we went again and took off the total sheets. There is a mistake in exhibit "350" in the total I am reading from but I don't know which it is there is a mistake there, or a difference of about $1,000.00. I omitted the item of bad debts $993.85, that was what was entered in the original return, I included that item in a number of instances, and in the Lincoln plant also, according to their system of bookkeeping the bad debts is included in Lincoln also.

The items I have read and given the footings of under those headings is all the expense I have included in my tabulation of the expenses for Cambridge then for year 1909, and salaries and office expense, and for distribution and general expense. Being handed
the printed report of the Cambridge company for the year
1660 1909, published under the direction of the Commission and *stated* to state if there are any other items of expenses for the Cambridge company for that year as shown in that report that I haven't included in these two columns in my exhibit "350," that should be included there,—I would say that I see no indication that there is anything there. Now in this report the first classification is of the total income of 15 cities in Massachusetts including Cambridge, Charlestown, Lynn, Salem and Lawrence that I have referred to in my tabulation; the Cambridge company is the third city in the printed report. The first page shows the gross income for each of these cities for the year 1909 as compiled by the Commission. It has a number of columns headed "income."

Which show the amount of income from private consumers, the first column; amount of income from public lamps in the second line; amount of income from other companies in the third line; amount of income for residuals in the fourth line; amount of income from other sources in the fifth line; and the total income appears in the next column; that is reduced to Per M feet of gas sold; and that is followed by the income from sources other than the gas business, including the net income from the electrical business; that is followed by a column total income for the year for each of these companies. On the next page you find the classification of the operating expenses for each of those companies; in that you find the amount of coal in the first column in dollars for Cambridge for the year 1909 to be $147,243.21; that is reduced to the amount per M feet made; that is followed by another column showing the amount of enricher in dollars and reduced to the number of M feet made; that is followed by the amount of dollars expended for purifying materials; that is followed by expenses for water; all under the heading of operating expenses. That is continued on the next
1661 page where the amount of wages of manufacture is shown in a separate column for the year; that is followed by repairs

and maintenance of manufacture. That is followed by a column showing the amount in dollars of renewals; that is followed by a column showing apparatus and machinery. That page is followed by another extending the showing of operating expenses, but I am not saying anything what that implies, that is heading manufacturing though. Probably all going to the manufacture of gas and probably bearing that title.

Next is the gas in holder per M feet made; the next column shows the gas purchased; and the final column in that tabulation shows the total net cost of gas made and purchased in holder as prepared by the Commission.

Being asked whether the cost expenses of distribution are shown in that report,—I would say as shown in that report the word distribution don't necessarily at all correspond with the item I have put down; it doesn't mean the same as the word distribution I have used; that is the heading of the compilation showing distribution. Under that is the total wages paid in connection with distribution in dollars. That is followed by repairs of mains and services in dollars for the year. That is followed by a column showing the expenses for repairs of meters. That is followed by the final column showing the total of these three items, but those columns don't under take to follow precisely the original return as for instance, the cost of meters.

The next tabulation here containing distribution expenses is the column which shows gas stoves, expenses of distribution in dollars and public lamps. And there is a column of the expense. Then a column total cost of distribution. Corresponding to the total cost of manufacture, there is a column headed that way. And then it says in the book the office and other operating expenses. In that you get what is denominated office expenses and the amount in a separate column. And taxes and the amount.

1662 And miscellaneous expenses and the amount. And the total cost of manufacture, purchase and distribution of gas less residuals in the final column.

On the next page you have the net earnings and their application. Showing the balance from the year's operation in the first column; in the next column there is a heading depreciation and other reserves. Giving the dollars of depreciation and other reserves. And in the next column you find other expenses, giving the amount of such expenses.

Being asked whether I have taken into account as a part of the operating cost here one of the items included in this printed report for depreciation and other expenses,—I find I have not put into exhibit "350" any charges that the companies may have made for depreciation as to the item "other expenses", I should have to compare that book with this one I have used just as well with the actual entry to see if the "other expenses" are not made up of a part of the entry occur-ing in the original return for Taunton, you will notice this printed return does not include all of those 31 headings of the regular printed return.

I notice in Cambridge the "other expenses" for 1909 was

$2,670.44. I notice that the depreciation for "other expenses" for that same year was $25,000.00, but it is set down as an expense, as depreciation and other reserves, but not as an expense.

Asked to take my figures for 1909 and asked to compare them with the figures here and see if I have omitted the "other expenses" in connection with that portion of the property of $2,670.44, and also see if I have not omitted the $25,000.00 which appears in "other reserves",—I now testify that I have not written depreication and other reserves in the operating expenses, it is not so written in the original return of the company and I so stated in that book from which counsel read. Whether I consider depreciation an
1663 operating expense or cost,—I think it may be fairly so considered in many ways. It would have to be taken care of as a part of the operating expenses of that and all other companies.

Whether I would consider the items classified as other expenses involved in the manufacture and sale of gas as a proper item of expense to take into account when I am classifying depreication and expense for manufacturing gas in Massachusetts,—I say it depends on the "other items", if the other items that lay in the expenses showed on the return on page 8 they should be included, otherwise not. Whether I deliberately omitted them, I took all on page 8 in the regular sworn statement of expenses and nothing else.

Whether I find on the report the $25,000.00 entered under depreciation and other reserves the item of $2,670.44 of "other expenses",—I would say that "other expenses" is an indefinite and general heading and I don't know which, if any, of those items are in the original sworn return as to which I have testified, from which I took all of my figures here, whether it includes certain items from that sheet of how much it includes, or whether it includes any I don't know. I did not say that figure in the 1909 report it is from which I presented the tabulation, I didn't see any such figure in the original return, and I don't think it exists there; I think it is a mere summary figure the Commission has tacked in that tabulation, just as they have tacked in others which don't correspond to the originals in the sworn returns. Whether I think they have reclassified the items I say I think they have combined some of the items. I have in here the total income for 1909, I haven't testified about it and I haven't got it in my copy. I haven't the total operating expenses of manufacture in the form reported by the commission, I have rearranged the items, I have the manufacturing expenses of the items but I haven't them added up in the same way as in the original return.

Being asked to say if I can avoid that $2,670.44,—I would
1664 say I am not desiring to avoid any $2,670.44 and haven't tried to.

Being asked if I would take the time to check my figures that I presented here against the amounts here shown as the total operating expenses of manufacturing; the total operating expenses of distribution; and the expenses of office and other operating expenses, and then disclose from that tabulation a statement whether I have omitted the $2,670.44 and the $25,000.00 shown in this report,—I would say that question is perfectly useless and senseless as regards

the $25,000.00 I have testified that it didn't, and that is not included in this tabulation; as to the other amount I will compare them and see if I have the expense, in it. Whether until I know that I don't know this tabulation of mine has any value or not,—I say I do know it has a value, it was taken from the original returns. I deny that if I omitted part of the operating expense carried there as an item of depreciation and omitted other expenses in the amount of $2,670.44 the statement that my tabulation isn't of any value, or that I didn't prepare a tabulation about depreciation and the amount of it. I haven't omitted any and if they existed in the original return of the company and there is nothing counsel has to show that I have. I brought in a tabulation where I say all expenses except materials and labor making gas, repairs, renewals and taxes as indicated in the sworn return of the company on the printed form provided by the Commission, which they are required to fill out under heavy penalty as that provides; and the only evidence they had in making this report up. I never testified about the source counsel is giving, and counsel disregards the source I laid before him and swore to, I took the sources which are the final sources.

Mr. Rose: When these tabulations were made an objection was made because we didn't have the original source to look over. Mr. Adams said we would find them in all except two sets under 1665 1912.

(Witness continuing:) I deny that statement and defy counsel to show any record to that effect.

Asked if I haven't already stated here that I have omitted items of operating expenses from my tabulation called "other expenses" or called -depreciation" and would I be willing to insert them now,—I say if I find that I have omitted, any item classified in the original sworn returns to the Massachusetts Commission and filled in by the company I would gladly fill them in. This exhibit is set before the court for the items I include under those headings, just what the legitimate expense would be for salaries and other expenses and for distribution and general expenses, that was my purpose. Whether if there was other expenses the company incurred as shown by the reports that should be included, going to affect either of those items, and would I be willing to put that in there,—I say I am going to include any expenses that was not already in the original returns that the Commission exacted.

My tabulation about office and general expenses as to the comparison between the Lincoln plant and Massachusetts figures, does not involve depreciation at all; it expressly excludes it; I didn't omit it because it wasn't included in the statement of expenses I was dealing with. There was no depreciation included in the Lincoln Company's expenses that I compared with these companies. I expect it does except depreciation. In the label I have put over it, asked where it excepts depreciation it excepts repairs and renewals,—which amounts to the same thing. In my classification I have repairs and renewals as a specific item. I was dealing with the heading there and no depreciation is shown in there, it is shown that it is precisely excepted in the words of the original return. I do not find

the Massachusetts Commission dealing with depreciation as a separate item and a separate operating expense. I do not find it
1666 in the printed reports and counsel can not point out on that page where it is.

I notice the column "depreciation" and other reserves under the heading "net earnings", which means gross earnings minus expenses and their application in plain English Language. The net earnings and their application are not made in the same way in this report on the next page as depreciation has been deducted; the net earnings are the difference between gross earnings and operation expenses. Being asked if there is any net earnings as shown here whether depreciation is deducted and also the items of other expenses,—I say no, I don't so understand the printed statement, although I didn't draw my tabulation from that statement at all. I don't understand from this statement that before they reached earnings they had deducted depreciation and other expenses; I understand the net earnings and right here in this column, which says net earnings and their application, and then it says balance from year's operation. I think that is the net earnings and so treat it. The next column is depreciation and other reserves; the next column other expenses.

As to what happens with reference to these two items and the amount of the balance of the year's operation, it is very likely deducted and from that you get dividends. In net earnings, it isn't so indicated, being asked if I would say dividends was understood to imply earnings, but what counsel refers to is not net earnings. As to what I call it,—what they call it in this column suits me well enough, the only possible amount of those two pages to which you can apply the heading "net earnings", is this balance of operation, that is the only amount that counsel or anybody can point out.
1667 Being asked if I would say that depreciation is an operating expense and other expenses in connection with operation is an expense of operation and if I would not get the net earnings before I deducted these operating expenses, as far as materials and labor were concerned,—I would say that I don't see any such thing as "other expenses". Depreciation is an operating expense in this, but it is commonly dealt with there generally after you get through with the statement of money actually paid for coal first and materials and labor, etc., it is dealt with entirely separate from the statement of operating expenses in the Massachusetts system of account of gas companies as shown here on this form which I testified every time I took my tabulation from. I haven't compared this company's depreciation with the Massachusetts depreciation at all, I compared it on entirely different items. In my exhibit "350", bar-ing any unintentional mistake of leaving out something that ought to go in or a failure to make a proper addition, I have treated all of these companies in the same way I treated Cambridge for the year 1909, but the method I have described is the method I followed in all of those companies.

Attention being called to Cambridge in 1907 and asked if I have the amount for repairs and renewals and maint*ainence* of mains and

service pipes,—I have in the amount of $8,588.11 The same item in the year 1911 is $28,122.36; but I suggest this isn't cross-examination as I haven't testified about these th-t counsel has cross-examined on. In 1907 witness being asked for the amount on item #10 wages of meter takers, clerical labor in this department and salaries or commission or collectors for 1907 in the Cambridge company, I would say the item is given at $20,820.21; the same item for 1911 is $30,720.41. Being a difference of about $10,000.00 the original amount was $20,820. and that was increased about
$10,000.00, which would be an increase of 50% along with
1668 the large increase in the gas output.

Taking the repairs and renewals in 1907 the amount expended was $8,588.00 and the same item four years later was $28,122.36 and witness asked to state what the rate of increase was for the expenditure of that item,—I would say that the figures are correct, I haven't figured the rate of increase; being asked as to what I think it would be,—I would say that amount runs very different as this company's account shows and all companies show, a big thing has to be renewed in some years which runs up the renewal account; I haven't presented any comparison for that for this company as compared with the Massachusetts companies, I have said nothing at all about it in my direct examination, and that item is expressly excluded from my heading; and also from my testimony except now that counsel asks me about it.

Asked why I don't just show the whole expenses, everything the company expended in the manufacture of gas here, and the total amount of sales of the company, and show the net result instead of just picking out items here and there,—to which I answer because I want to pick out and compare the items over which this company has control, and under which it puts its hands in the treasury of its clients and gets out the money; I want to show that these items over which this company have peculiar control, not being covered in a competitive market by materials and labor to see what those items under its control necessarily cost and then under the Massachusetts companies' eye sight, that is the reason I did it. They are much larger in the gas department while the electric company has gone down, I have the statement of the electric department.

I have not been able to work out the details of the $1.40 for freight, etc. on the meters, and am afraid I shall not until we let up
on the night work. I have it at my room but it takes time
1669 to find it, I haven't it here. Neither have I worked out the details for the 7% for engineering, etc. Asked if I would be able in any way to segg*r*egate the amount of repairs, renewals and depreciation from the repairs and renewals in dealing with this property,—In answer that repairs and depreciation together can be approximately separated. I have testified on that repeatedly. As to what per cent or what amount of the total covering the three items I would set apart for renewals and depreciation I testified that 3 cents per M feet also would be sufficient for ordinary repairs, it would leave 6 cents on my allowance of 9 cents to cover depreciation and renewals both, but the figures are less even that that on the

basis of my valuation, but I made my valuation big enough so that the company could have 6 cents. It happens to divide so that out of the total item it would figure 1/3 for repairs and 2/3 for renewals and depreciation, I wouldn't say that that was the relation of the figures; it figures that way in this case that the said amount of renewals and depreciation bears on the size of the plant and its supposed costs. The way it figures out in connection with this property as I estimated it, it would apportion 1/3 to repairs and 2/3 to renewals and depreciation.

I gave an item of $104,000.00 for repairs and renewals for 1903 as shown by my exhibit "309", which shows that including the meter setting and removing, you charge for the year 1903, for repairs and renewals,—I think the company uses the word main*tainence*,—and the same gives a total of $104,246.00; now of that setting and removal item because where you are frequently changing the meters,—a considerable portion of it should be deducted, but I put it all in. I haven't reduced to cents per M feet. As to what repairs and renewals could be involved in an item of setting meters, I would answer that the cost of a meter as it sets in the service is partly represented by the cost of getting it there and setting it. That isn't a repair, but when you have to repair or renew you
1670 must go and take out an old one and put in a new one and there is an item of repair. I have the amount of repairs and renewals for every year separately. Asked for the totals for 1907 and 1912,—I answer that I haven't that total.

Mr. Whettling: The total exclusive of removing and setting meters is $55,684.04, meter setting and removing $12,588.41, total $68,272.45.

(Witness continuing:) I have the amount of 9 cents per M covering the items of repairs, renewals and depreciation and I have also the amount of the out-put for each of the years since 1907 to 1912. Being asked to tell how the 9 cents per M I have provided for repairs, renewals, and depreciation for the year 1907 based upon the amount of gas that was sold,—I would answer that I went over all of *the* yesterday, but I will get it again.

For 1907 my allowance of 9 cents per M feet for all repairs, renewals and depreciation on an output of 179,366 M feet of gas sold amounted to $16,142.94; for 1908 my allowance of 9 cents per M feet for all repairs, renewals and depreciation on an output of 195,391 M feet of gas sold amounted to $17,585.19; for 1909 on the sale of 204,288 M feet of gas was $18,385.56; for 1910 on the sale of 210,169 M feet of gas was $18,915.21; for 1911 on the sale of 227,268 M feet of gas was $20,454.12; for 1912 on the sale of 234,386 M feet of gas was $21,094.74.

1671 I have undertaken to take care of all the items of depreciation by allowing a certain amount per M feet gas sold for repairs, renewals and depreciation. Asked whether I think the item of depreciation of the distribution system bears any relation whatever to the gas sold,—I answer I think it bears to determine the relation within approximate limits, but not a hard and fast relation, as between different systems or as between the same system,

but it can be conveniently computed to an approximate measure that way.

Whether if double the volume of gas was sent out through the system it would affect the depreciation,—I say if you could send out a double volum*n* through the same mains,—of course, that fact that a double volum*n* went through wouldn't make the mains depreciate faster, except it might give rise to additional depreciation on account of inadequacy that you would have to make your mains carry, as the company did in 1908, 1909 and 1910. The gas itself doesn't affect the mains; it oils them up a little and keeps them in good shape. The depreciation comes from the contact of the mains with the soil, and it is affected by the age it is in the ground, or from the inadequacy of the mains, and the changing locations of the population; that is one factor, but I don't know as that last one would be of much application here. Whether if taking only one-half of the present sales, or one-half of the present volum*n* of gas that would affect the amount of depreciation in the distribution system,—if through some miraculous and extraordinary situation the company would sell only one-half as much gas the next year as it did last year that operating change wouldn't work any material change perhaps in the rate of depreciation on the main system,—but taking things as they ordinarily happen, the depreciation of the mains will run along considerably close, fairly close; also,
1672 as to the volum*n* of gas sold, there is some variation between different plants,—it might be that the variation in the same plant as between years, is quite widely separated, but it is a convenient and not an inaccurate way of getting at the matter. It is not true that it is taken by me more for its convenience than its accuracy. There is a more accurate method of determining the amount of depreciation that should be provided for in each of the years going along, there is one that I have shown in my valuation, by computing the natural depreciation of the respective items of the plant, as near as we can fix on their fair life, and comparing the new cost with that fair life,—that, I have shown in detail in my valuation. I found the valuation of this property in 1907 and again in 1913.

The basis of depreciation that I applied to the property the company had in 1907 to deter*im*-e its value in 1913, I took what I estimated to be the cost of producing such similar or equally sufficient and efficient property and divided that estimated cost by the number of years I estimated the thing would fairly last in this plant so the consumer might pay back to the company during the use of the apparatus all that it would cost the company. I took the equipment in 1907 and gave a specific life to each of the items of equipment at its age.

Assuming a particular equipment in 1907 had a life of 25 years, that is, the remaining life of it, in 1913 six years of that life would have been taken up,—I haven't made any computation on the remaining life particularly, but you can suppose that. Whether I depreciated the property between 1907 and 1913 on the basis of the life of the property,—I say I depreciated the property all the

time on the basis of its elapsed age, in relation to its total estimated life, that is, if the property had been in use at the time I
1673 valued it in any year, one-half of its estimated life, I took off one-half of the estimated cost to procure such property.

Whether I find in my valuation a certain composite per cent of annual depreciation of 1.9%,—the term composite may be used, I don't use that term, I find a certain per cent of depreciation on the combined cost of the entire property. For 1913 that per cent was 1.9%. I did not apply that per cent of depreciation to the property between 1907 and 1913,—I got at the amount of the depreciation on the property that it had in 1907 and that it had in 1913 by taking the age of it in 1913 and deducted from its new cost that portion of its estimated life represented by its age; that is, for the thing that I found in 1913 if it was assumed to have a life of 40 years and in 1913 I found it was 20 years old, I took off one-half of the estimated cost of producing that thing, as its depreciation. When I got to 1913 that specific result in dollars was merely the annual depreciation for 1913, which was $10,914.26.

It is not right nor fair to say that I have added to that item, engineering, etc., 7% which gives a total of $10,914.26 with the engineering in it and have depreciated the engineering the same as the other, and have depreciated that property for 1913 $10,914.26 because of the age of the property. I did not depreciate it $10,-914.26, that is merely the allowance for annual depreciation, that isn't the total depreciation. Being asked what I deduct for the depreciation of the company's property for 1912,—I haven't deducted the depreciation pro rata year by year, but have taken the property in each of the two years I valued it and depreciated it according to its age in each one of those years on the basis I have stated
1674 by taking off that percentage of its new cost which was represented by the age of the particular piece in the plant from its estimated life; if the age in use equaled one-half of the estimated life I took off one-half of the estimated cost as depreciation. I have no figure here representing that I took off any particular amount or any estimate for the amount in 1912; I valued the property as of two dates, 1907 and 1913. In getting at the amount I take off the value of this property for the purpose of determining the value of the equipment I have considered the age of the property and its life. And for the purpose of taking care of that depreciation in the future I have resorted to 9 cents per M feet of gas sold, and also to something else; I have made my 9 cents per M ample and larger than the figured estimate per M feet sold and charged the total sum in dollars, of the total sum I have shown for total depreciation computed on the same basis I have indicated. I certainly can take my 9 cents per M and apply it as well to the years 1912, 1911, 1910, 1909, and 1908 and get back to 1907 and account for the depreciation that I take off on account of that equipment out of the 9 cents per M feet; 9 cents per M amply takes care of it and leaves an ample margin for repairs. I depreciate this property on a fixed and definite amount when I come to value the property based upon the age of the property

and its life. Between the years 1907 and 1913 I have depreciated this property upon that basis; and have provided out of the operating expenses an amount to take care of that by providing so much per M feet of gas sold.

Asked to show by the tabulation I have prepared that I have provided sufficient money out of the sales of gas at 9 cents per M feet to take care of the repairs, renewals and depreciation
1675 since 1907 where I have depreciated that property on the basis of its age and life, and asked to take the whole period and show that,—I will say that is a lot of figuring, but I will be glad to do it if the case lasts long enough, but human effort is limited by time, but take the year 1912 on my exhibit "232" and you have set down the annual depreciation in dollars $10,914.26.

To the statement that I didn't experience any difficulty in seggregating depreciation from repairs and renewals in order to get the value of the property.—I will say that renewals take care absolutely of depreciation, that is what I have tried to explain. Here are the figures that I allowed the company for repairs, renewals and depreciation in 1912 $21,094.74 as against the depreciation alone which of course, means renewals too, $10,914.26 that is, I allowed twice as much on the basis of 9 cents per M feet sold as the estimated depreciation based on my valuation of the specific items of property, and on my estimate of its new cost, amounted to for that year. My $21,094.76 included repairs, renewals and depreciation. Nobody know- how much of the $21,000. was expended by the company for repairs, I don't think counsel knows, and I don't know. I never said that of the $104,000. one third was for repairs and two thir-s was for renewals and depreciation. I said my allowance was one third of the 9 cents for repairs and my allowance of two thirds of the 9 cents was for renewals and depreciation, but that wasn't the money the company spent. To the statement that I make one tabulation showing the amount of depreciation based upon the physical valuation when depreciating the property for the purpose of getting its value; and then give another statement of the amount I provide out of the revenues that the company can take care of depreciation for the same time,—I say not using another method to take care of depreciation. I took care to allow enough by that other method to more than equal the sum which I have figured the
1676 property would depreciate. I did not use one method for the purpose of valuing the property and another to provide a fund to take care of that depreciation. I used the age and life of the property in both cases. In the one depreciated it at a certain percent each year, and in the other provide for the company taking care of that depreciation and put it in with repairs and renewals in a lump sum per M feet of gas sold, but gave the company the element of depreciation to start with greater than the depreciation. Being asked to show that,—I say I have shown that for 1913 and if given time I will show it.

Being asked to furnish such tabulation for 1907 to 1912 to justify the integrity of my computation, I say as far as the tabulation is

concerned that will depend on the time of the case, if there is any question remaining unanswered I will be glad to answer it.

Mr. Strode: We have only asked for three things, the details of that $1.40; the details of that 7%, and this last item.

1677 Mr. ALTON D. ADAMS, a witness for the defendant City, was recalled for further examination in chief, and having been sworn herein, testified as follows:

Examination in chief by Mr. Foster:

In exhibit "350" I have included in the totals under the heading "All expenses, except materials, labor making gas, repairs, renewals and taxes", per sworn return to the Massachusetts Commission, all items given in the original return of the respective companies named in the exhibits, to the Gas Commissioners of Massachusetts in the respective years on the page where the expense is stated, except those excluded. The exact list of items included in the exhibit comes under slightly different headings during the series of years to which the exhibit relates; but in each year whatever the sub-heading on the expense sheet as reported by the company is, I have taken the expenses under all of those sub-headings, except as to the expenses specifically mentioned as excluded, and as *the* the item of "bad debts", which I have previously testified to, I haven't treated as an expense at all. This can be illustrated by reference to the year 1912 for the Cambridge Gas Light Company for the year ending June 30, 1912; I have included in my total column on exhibit "350" headed "Total above expenses" the item of wages of meter-takers, clerical labor in this department, and salary or commission of collectors, amounting to $31,960.09; Salaries of officers and directors combined into one item of $8,855.; other general salaries $8,291.68; Advertising, which I think does not occur as a regular form of printed heading, but was inserted as a script interlined heading probably, under incidental expenses, at $2,121.24; General Office Expenses $15,287.24; Caring for street lamps no expense; Material, other street lamps, no expense; None given in the original
1678 return for either of those; Distribution, tools and appliances, $6,097.92; Rent of offices, $4,567.98; Insurance $5,124.59; Law expense $1,616.59; Claims $275.; Meter connections $5,844.80; Stove connections $2,398.62; Fixing gas stoves $5,342.51; those items that I have mentioned are not the ones included by me in the "total" column asked about, and are all of the expenses entered on the expense sheet of the Cambridge Company in its original return for the year ending June 30, 1912.

In exhibits "350" to "361" in that manner I have treated all of the expenses under that heading for all of the companies, taking all of the items of expense, except materials and labor making gas, repairs, renewals and taxes, per sworn reports to the Massachusetts Commissioners on the column of expenses in those sworn returns, and which has at the bottom the words, "total expense". I think the designation of the various items of expense in different years has

been varied slightly, but I have taken them all on that sheet except as noted in the heading of the exhibit mentioned.

Explaining my method of handling the other expenses, other than proper operating expenses, under the Massachusetts system of accounting as outlined by the Gas and Electric Light Commissioners of that state, such expenses are required by the system of accounting, and the printed instructions of the Commission, to be charged in the profit and loss sheet and not in the sheet that I have already mentioned which is headed "Statement of Income and Expense" and has at the bottom "Total Expense".

In making up my heading for my tabulation—exhibits "350" to "361" inclusive, and saying "total expenses", I mean the total expenses as required to be reported on the expense sheet in the regular form of returns from gas companies required by the Gas and Electric

Light Commissioners of Massachusetts, the expenses which
1679 are required to be reported on that sheet as a proper expense of the gas business, and not expenses relating to some other matter, which are not considered as proper by the Commission to be reported on the expense sheet mentioned, but are required to be reported in the profit and loss department of the return.

In the report of the Massachusetts Commission the item "other expenses" may be found for the year ending June 30, 1912,—that is public document number 35,—the 28th annual report of said Commissioners, at page 255-A, under the heading "other expenses". This "other expense" is a sub-heading, and occurs in the general heading at the top of the page which reads "Net earnings and their application". I would like to explain that in the said report of the Gas Commissioners of Massachusetts for 1912, which also bears the date January 1, 1913, being for the operations for the year 1912, that pages 249-A, to 254-A, inclusive, bear at the top the caption "Operating Expenses" are immediately followed by page 251-A in said report by a tabulation bearing the general caption "Net earnings and their application", and it is under this genera- caption of "Net earnings and their application", that we find the sub-heading "other expenses", giving the names of 20 companies and the "other expenses", if any, as against those respective companies.

The pages 249-A to 256-A inclusive were identified as exhibits in this record as exhibits "429-"1"; 429-"2"; 429-"3"; 429-"4"; 429-"5"; 429-"6"; 429-"7" and 429-"8".

Exhibit 429-"7" offered and received in evidence for the purpose of showing the classification of "other expenses", defendant stating that it does not rely on any specific amount of expense shown for any item.

(Witness continuing:) The item "other expense" in the report
of the Gas and Electric Light Commissioners for 1912, shown
1680 on exhibit 429-"7",—the "other expenses" amounting to $4091.51 for the town of Cambridge appears also in the "profit and loss" account on page 58-A of said report against the entry "other items", on the debtor side, and the said profit and loss account, comes after a statement of operating expenses on the preceding page, that is, page 57-A, showing that according to the classi-

fication used by the Commissioners the item entitled "other expense" in exhibit 429-"7" is in fact found in the detailed operation of the Cambridge Company for 1912 in its profit and loss account.

That indicates, according to the form in which the expenses are reported in Massachusetts, and the regulations of the Commission governing that form, that the item of "other expenses", $4091.51, was not considered a proper item to be included in the operating expenses of the gas business. Besides the reasons already given for thinking that item "other expenses" is not a proper charge to operating expenses, I have the additional other reason that I am very familiar with items so entered as "other expenses". various items, in a great many companies in a great many years that I have found in the profit and loss account of the company and not in the ooperating account.

Objection as incompetent and no proper foundation laid was made to witness stating his knowledge of the instructions of the Massachusetts Commission to various companies about including such expenses in the profit and loss account, was overruled, to which plaintiff excepted.

(Witness continuing:) I know that expenses not properly operating expenses in the gas business are required to be reported in the profit and loss account through having read the regulation and through being very familiar in the examination of many of these original returns and finding such expenses in the profit and loss account, so I know from both of those sources.

1681 Witness handed copy of report of the Gas and Electric Light Commissioners for 1912, and attention called to the item "other expenses" on page 255-A after the name of the town Charlestown, amount $532.39, and asked to point out if that item appears anywhere else in said report,—states, I find on page 62-A in the profit and loss account of the Charlestown Gas and Electric Light Company against the entire "other items" the figures $532.39; under the same heading in said report appears after the town of Lawrence the figures $3995.60; that item also appears in same report under the profit and loss account on the debtor side against the entry "other items" $39,995.60; I would like to extend myanswer as to the Charlestown Company, that was on the debtor side also; under the same heading in same report appears after the town Taunton appears the figures $75.00 on page 255-A; that item also appears in the same report on page 164-A on the debtor side of the profit and loss account against the entry "other items" $75.00; under the same heading in the said report on page 255-A appears after the town Haverhill the figures against the entry "other otems" $11826.91; I find at page 99-A on the debtor side of said report in the profit and loss account the entry "other expenses" the item $11826.91.

Exhibit "430" was prepared by me or under my immediate direction; as to its source, it is a computation as to the depreciation and repairs of the Lincoln Gas & Electric[f] Company, and is headed: "Lincoln Gas & Electric Light Company, annual depreciation and renewals computed on cost of plant; and repairs, renewals and

depreciation as computed at nine cents per M feet sold. Following that heading is a tabulation of four columns running from 1907 to 1912 inclusive, the years being in the left hand column. In the next column is a set of figures under the heading "Dollars depreciation and renewals computed on cost". Those have been obtained by computing on the basis of my estimated cost for the several
1682 items of equipment and plant in the Lincoln gas plant; the annual depreciation on the basis of the life that I have assumed and used in connection with my computations as to the depreciation and value of said plant in the years 1907 and 1913, January 1st of each year. The first line in the column headed "Depreciation and renewals computed on cost" contains opposite the year 1907 the entry $6962.74, being the same depreciation, annual, that appears in my valuation of the Lincoln Gas Plant as of January 1st, 1907.

Against the 1908 year there appears the entry $7839.18. As against the year 1909 there appears the entry $9234.42; against the year 1910 the entry $9858.69; against 1911 the entry $10455.93; against 1912 the entry $10914.26; which latter entry for 1912 is the same as the annual depreciation that I have computed on the Lincoln Gas Plant for the year ending January 1st, 1913, that is, the same annual depreciation that I show for that time.

In each of these years the respective amounts of depreciation I have shown has been obtained by taking the estimated cost of each piece of equipment for all of the equipment then existing, and dividing the estimated cost by the estimated life of the said piece of equipment, and then by adding the result of those divisions together to get the total annual depreciation applied to that year. To illustrate: Take a piece of equipment that I have estimated in my valuation to have a life of forty years, I have taken the estimated cost of that piece of equipment and divided it by forty and the resulting sum in dollars is entered in each and every year as the annual depreciation on that piece of equipment, because it costs a certain amount of money, it is assumed to wear out and disappear in forty years; and so it is fairly estimated that in each of those forty years one-fortieth of its new cost should be written into the depreciation and renewal sum that should be allowed out of
1683 the rates.

The next column in exhibit "430" is headed "Dollars repairs, renewals and depreciation at nine cents", meaning that the repairs, renewals and depreciation as set up therein as a total are computed at 9 cents per thousand feet of gas sold in the year. These sums so computed at 9 cents per M feet of gas sold have previously appeared in an earlier exhibit where I estimated the entire sum to be allowed out of the earnings of the company for the repairs, renewals and depreciation necessary to keep up and keep good the value of the plant.

For 1907 as against the allowance for depreciation and renewals alone, as computed upon the cost of the plant, amounting to $6962.74, the sum in the column where all repairs, renewals and depreciation is computed at 9 cents, amounts to $16142.94, leaving

an excess as shown in the next column, over the amount required for depreciation and renewals alone of $9180.20. So again in 1908, the amount of repairs, renewals and depreciation at 9 cents per M feet of gas sold amounts to $17585.19, showing an excess in the next column of $9746.01 over the amount of depreciation and renewals alone as computed by me on the cost of the plant.

Again in 1909 the total repairs, renewals and depreciation computed at 9 cents per M feet of gas sold amounts to $18385.56, showing an excess of $9142.14, over the amount computed for depreciation and renewals alone, based upon the cost of the plant.

Again in 1910 the dollars total, of repairs, renewals and depreciation computed at 9 cents per M feet of gas sold amounts to $18915.21, showing an excess of $9056.52, over the dollars depreciation and renewals computed on the basis of the cost of the plant in that year.

In 1911 the dollars total, repairs, renewals and depreciation computed at 9 cents per M feet of gas sold, amounts to $20454.12,
1684 and shows an excess of $9998.19 over the dollars depreciation and renewals alone, computed by me on the cost of the plant.

In 1912 the total repairs, renewals and depreciation computed at 9 cents per M feet of gas sold amounts to $21094.74, as previously shown by me in an earlier exhibit, and shows an excess of $10180.48 over the amount estimated by me to cover depreciation and renewals alone on the basis of the cost of the plant.

Exhibit "430½" is headed "Depreciation per M feet gas sold". It presents a tabulation of figures for each of the years 1907 to 1912 inclusive, including first the M feet of gas sold in each year, that is, the thousand feet, and then a column containing dollars depreciation and renewals computed on cost; meaning that they are computed on my cost of plant in the way that I have previously explained of computing depreciation on cost; then a column headed "Cents per M feet sold computed on cost"; and finally at the right hand a column headed "9 cents, less computed renewals and depreciation.".

When *O* speak of cost I mean the reproduction cost of the Lincoln Gas Plant as I have estimated it. The Dollars depreciation and renewals computed on cost as shown in exhibit "430½" are the same in each year as the quantities under the same headings in exhibit "430". These quantities corresponding to each year in exhibit "430½" are divided by the M feet gas sold in the respective year so as to get the "cents per M sold computed on cost", meaning thereby the cents necessary for depreciation and renewals as computed in dollars on cost when reduced to cents per M feet of gas sold during the year in question.

Thus, for the year 1907 the dollars depreciation and renewals computed on cost amount to $6962.74; In that year the sales amounted to 179,366 M cubic feet of gas sold; dividing 179,366 M feet into the $6962.74 gives 3.88 cents per M feet sold com-
1685 puted on cost. If this 3.88 cents per M feet sold computed on cost of plant by me, is deducted from 9 cents, the amount I have allowed for repairs, renewals and depreciation per M sold in each and every year, it leaves 5.12 cents for repairs or for additional

depreciation if I have failed to estimate it; 5.12 cents being more than is necessary for any ordinary repairs taken as a whole from year to year.

In 1908, following the method I have previously described as to 1907, that is, dividing the 195,391 M feet of gas sold in 1908 into $7839.18 depreciation and renewals computed on cost, gives 4.01 cents per M sold computed on cost, which deducted from 9 cents, the amount I have allowed for repairs, renewals and depreciation, leaves 4.99 cents for repairs and any additional depreciation, if any.

In 1909 a like computation as those just described for 1907 and 1908 gives the cents per M sold computed on cost at 4.52 cents, which deducted from 9 cents, the amount allowed for all repairs, renewals and depreciation, leaves 4.48 cents.

In 1910 the cents per M sold computed on cost as previously described, amounts to 4.69 cents, which deducted from 9 cents, leaves 4.31 cents, more than enough to cover any ordinary repairs as they ordinarily run from year to year.

In 1911 the cents per M sold computed on cost by me, amounts to 4.61 cents, which deducted from 9 cents, leaves 4.40 cents.

In 1912 the cents per M sold computed on cost by me, amounts to 4.65 cents, which deducted from 9 cents, leaves 4.35 cents. The 9 cents allowed by me on all sales of gas during this period of years per M feet sold, is not intended to cover precisely and exactly the amount total of repairs, renewals and depreciation as actually occurring in any one year, because it may happen in the conduct of the business that the necessary renewals are particularly
1686 large in one year or particularly small in another year, and taking the sum computed at 9 cents per M feet sold it might well happen that you would have some excess on that sum in one year and would require that excess in the following year to carry along all ordinary repairs and make the desired renewals, and compensate for the shrinkage in the value of the property not renewed.

Exhibit "431" is headed "Lincoln Gas & Electric Light Company, yearly depreciation and renewals computed on cost".

This exhibit shows the amount in dollars of depreciation each year from 1907 to 1912 inclusive; on the Lincoln Gas Plant as computed by me on the basis of my estimated cost of the said plant. Consisting of a tabulation including at the left hand a list of the respective plant items in a column; in the next column a statement of the year when the item came into existence; in the next column in dollars the estimated cost of the items in that year;—of course, as to the year one item came into existence, as in the case of the items like mains that had gradually came into existence, that cannot be precisely stated, but the estimated cost of all the mains in existence in each year is stated. The year built is inserted in this tabulation for the purpose of indicating in which year the depreciation of the item in question should begin to be added in to make up the total annual depreciation for that year. The depreciation on a particular item of plant cannot begin to be figured in until the item arises in existence.

In the next column said statement of the years of life as esti-

mated and applied by me in the valuations of the Lincoln gas plant as of January 1, 1907 to January 1 1913; in computing the depreciation and the value of said plant. The use made, without exception, of the years of life being to divide the estimated cost of the plant item by the total number of estimated years of life and add the number so obtained into the amount estimated for annual depreciation and renewals; or, as I have said in many places,
1687 simply for depreciation and because depreciation and renewals cover, to a large extent, the same thing. Depreciation necessarily covering renewals, and renewals being a part of depreciation, being the whole of depreciation on a particular item renewed.

Depreciation at the same rate,—I may say in connection with this explanation,—has uniformly been deducted from the items of plant to determine the value of the respective items of January 1, 1907 and 1913, respectively; that is to say, I have determined an annual depreciation to be charged for each year of use as to each item of the plant, and I have deducted from the estimated cost of that item of plant the annual depreciation,—and only that and just that,—for each of the years that the item of plant has been in use in order to obtain its value on the date of valuation; so that if my estimated years of life are too short, for instance, the others of the plant item given annual depreciation is a larger depreciation than the consumer ought to pay, and on the other hand depreciates the property faster than ought to be done. So that the results as between the consumer and the company of any error or misjudgment in selecting the years of assumed life are in some degree compensatory, that is, they work against each other. Of course the cost of the value of a plant at any particular time, assuming that to be the amount on which interest is paid, in applying my method of computing depreciation, if you make the plant smaller than it ought to be because of the rate at which you depreciate it, you make the consumer pay more than he ought to pay as an annual depreciation sum. So that the extra amount paid for depreciation, would to some extent, offset the lack that the consumer would be called upon to pay in interest on the then value of the property. The exhibit runs through 8 pages I will indicate
1688 that the heading found on first page should be applied to all the eight pages. They show plainly that they are all part of one document. The total depreciation for each year is obtained in exhibit "431" by footing up the depreciation estimated in the way I have explained on each of the items of plant, and then add seven per cent to that footing, because in the method I have followed of estimating cost of plant I have found it more convenient to add the 7% item for engineer and various other expenses to the footing of the various items rather than working it into the cost of each item.

Being asked whether I have added the 7% to the depreciation of each year up to the total of the six years,—I would say I haven't even made a total of the six years.

Now, the depreciation to be allowed in the year 1907, as thus com-

puted in August, is $6,962.74; in 1908, $7,839.18; in 1909, $9,243.42; in 1910, $9,858.69; in 1911, $10,455.93; in 1912, $10,914.26.

Now, these items of depreciation representing the totals for the years are the items that have been carried back into exhibits "430" and "430½", and they are set down as the depreciation and renewals computed on cost.

Exhibit "432" is entitled "Cost of coal and oil in Massachusetts Gas plant, from Brown's Directory of 1912." Said exhibit contains a list of various Massachusetts gas plants in a column against which the name of the city or town where each plant is located is situated. The price of coal per ton appearing in Brown's Directory, in so far as the price of coal was found in Brown's Directory; the cents oil per gallon is also stated, that a number of omissions, except the cents per gallon of oil was not found, and the stated candle power of the gas in Brown's Directory; and the stated heat units.

1689 so far as found in each plant, in Brown's Directory.

Exhibit "433" is headed "Lincoln Gas & Electric Light Company, Cost of Specials and Other Materials, except pipe, per mains work orders 1905, to 1912".

Said exhibit contains a statement of the feet laid in the sizes of 2, 4, and 6 inch pipe as found on work orders, and a statement in pieces of the other material; the cost of other material found stated on the work orders, reduced also to cents per foot.

Exhibit "434" is headed "City of Lincoln, Contract Prices Per Cubic Yard of Excavation for Paving". This exhibit is made by me and under my direction, being a compilation of the numbers of paving districts in the city of Lincoln, running through the years 1906 to 1914; the cents price per year in those contracts for extra excavation, socalled; the approximate years of extra excavation in connection with the said contract; the location of the district, in so far as name of street that the district lies on. These prices for extra grading or excavation, in connection with paving contracts, according to this list, run from 30 cents up to 50 cents,—50 cents is the highest one my eye lights on,—in connection with these contracts the haul limit is 1,000 feet only as I understand it, and no extra compensation is paid for disposal of any of the material until the haul exceeds 1,000 feet from where the earth is removed.

Exhibit "435" is entitled "City of Lincoln Contract Price Per Cubic Yard for Grading" and this exhibit shows the No. of grading districts in the city of Lincoln from 1906 to 1910, giving the number of all except one, which was not obtained. The cents per cubic yard for grading provided in the contracts relative to those districts, and the location of the districts; the cents per cubic yard so provided run, in connection with these grading districts, from 18

1690 cents to 33 cents, those being the highest and lowest I see; there are only a few of those that were obtained. I understand in connection with these grading districts that the haul required by the contracts, is necessary, extend to 1,000 feet without additional compensation, and that after that and over-haul allowance is made.

Exhibits "430" and "430½", "431", "432", "433", "434", and "435" were offered and received in evidence without objection.

Exhibit "436" is entitled "Price Paid Laborers for Digging Trenches Two Feet Wide for Sewers in the City of Lincoln, as Compiled by Adna Dobson, City Engineer".

The fundamental data on which this exhibit is based was obtained by me on inquiry and investigation, on which I learned there was commonly paid to laborers in Lincoln a set of prices for digging sewer pipe trenches known as the "scale", "The Lincoln scale for sewer-pipe trenching", and I obtained such a scale from the City Engineer's office which I thought and — assured was correct. The exhibit is made up of two sheets, each containing four columns, the first or left-hand column on each sheet is headed "Feet Deep", meaning depth to which the sewer is dug; the second column is headed "Cubic Feet Per 2 Feet Wide", meaning the number of cubic feet contained in a trench two feet wide and of a stated depth. I know what there is to tha- depth, as the scale as furnished me had for its first entry, as I remember it, five feet to 5.25 feet, and then 5.25 feet to 5.50 feet, and I cut out the greater depth in each case. I had to select some number on which to make the computation, and I took the smaller number, the smaller
1691 or less depth, which would result in a slightly trifling yardage for each depth, and, consequently, trifling higher price per cubic foot, which I am after. The third column in the exhibit contains the cents per linear foot which constitutes this scale in connection with the depth and dimension; that is, the cents per linear foot paid to laborers who dig the trenches as I find by inquiry and investigation.

The last or right-hand column is a column of my own derivation, in which is shown the cents per cubic foot resulting from the previously mentioned column of quantities for 5-foot sewer; this cents per cubic foot is .8, or .80; it runs along, varying slightly, still up to .10 feet and 10.50 feet it is still .8, it figures out that way, but after that it begins to rise and goes up gradually; so that, for instance at 14 feet it is one cent per cubic foot, and at 17 feet it is 1.17 cents *cents* per cubic foot. These prices, as I said, I understand are those that are paid to the man who digs the trench, by the contractor or by the city, if, in any instance, it engages in the construction of the work itself.

Exhibit "437" is entitled "Labor Cost on Water Mains and Hydrants with Trench $1.00 per Section, Eight Cents Per Foot". The exhibit is a compilation of figures made by me and under my direction and shows the length in feet of 4-inch and 6-inch pipe laid by the City Water Department as shown by their records during the years 1909 to 1913 respectively; and the total labor cost of laying said pipe in dollars, then reduced to cents per foot for all the pipe on which the labor cost was given; and the trench for it was done at $1.00 per section, that is, eight cents per foot, 12½ feet for a section. This exhibit "437" does not purport to include all the 4-inch or 6-inch pipe laid, or even all for which the labor cost

was given, but only that which contained the total labor cost
1692 of laying, and had the trench part of the labor done at $1.00 per section.

Exhibit "438" is entitled "Labor Cost of Lincoln, Nebraska, Water Mains, With Hydrants, All Mains With Labor Cost Given", and includes a statement drawn for me and under my direction from the records of the Lincoln Water Works Department, showing the size and length of all the mains in the said records for the years 1907 to 1912 inclusive, for which the labor cost was found and irrespective of whether the mains were inralled by having the trenches done by the job or having the labor done in some other way.

The total feet of 4-inch mains so found was 37,095 feet; that length of feet being computed, I believe, by multiplying the number of sections by 12, without taking into account minor variations from that which would occur on account of the specials used in connection with the regular lengths of pipes.

The cents of all labor per foot on that 4-inch size of pipe was 23.44 cents. The exhibit shows, setting out year by year, 31,066 feet of six-inch pipe, with a total labor cost of 25.60 cents per linear foot; on the 12-inch size 3,683 feet, with a labor cost of 62.27 cents per foot; and on the 16-inch size 8,344 feet, with a labor cost *of* per foot of 71.76 cents.

It should be noted in comparing these labor costs with others that they involve the trenching common for water mains, which I find is generally reported to be about 5.½ foot cover over the pipe, and involves the making of lead joints throughout the mains; involves the setting of all hydrants and warer guides or valves set with these mains, and which adds reasonably and materially to the labor of laying the mains and doing all of those things, and very frequently it would be to laying simply street mains. By
5½ foot covering I mean 5½ feet of earth over the pipe,
1693 above the top. The trench would be deeper than 5½ feet, according to size of pipe, just as it has been figured for the gas, although it would be deeper than the gas trenches, at least that is the way I have estimated it, and the way I understand it. Gas trenches are not as deep as the water pipes are.

Exhibit "439", consisting of a number of pages is entitled "Lincoln Sewer Contracts" and contains a statement in each year beginning with 1907 and running to 1913, of a large number of contracts for sewer pipes, explaining in this connection the paving contracts, the grading prices as shown in connection with paving contracts; that we didn't take all of the paving contracts by any means, but took of each only three or four in each year, and in asking for the contracts I asked to have contracts that involved the larger amounts of extra grading, some of them not having any extra grading of any amount in each year; and they were selected by one of the clerks in the city clerk's office and furnished to me on that request, and then we took them after that as we found them.

Returning to the sewer contracts, the linear feet of sewer here stated are all for the laying of 8-inch sewer pipe, except I notice one at the end of the exhibit, and only one, involving a very small length

and that is marked 10-inch, and that portion of the exhibit I would like to withdraw, I don't want to bother with it, and it is only 204 feet of a different size.

The exhibit sets up in tabulated form the linear feet of 8-inch sewer pipe covered by the respective contracts; also the cents' price provided in the contract per linear foot of completed pipe laid, less the cost of the pipe and laying per linear foot. Right there occurs something that will make it necessary to introduce another exhibit, because I intended to have in connection with this exhibit a
1694 tabulation showing, as I have in my book, the actual contract price per linear foot. It was impossible to get into these final figures the column showing that contract price, so that the price shown here per foot is not the contract price, but is the contract price minus certain deductions that I have thought it proper to make in making my estimate about this. The contract price and the nature of the deductions ought to be shown, and to make this exhibit fully informing the tabulations as to the contract price per linear foot of sewer pipe ought to appear here, and I can furnish it. This is exhibit "439".

Mr. Morning: We will reserve the right to put in the tabulation mentioned to be known as exhibit "440", which Mr. Adams will now explain to save the necessity of his coming upon the stand again.

(Witness continuing:) Exhibit "440" will contain the linear feet of sewer pipe provided for in the several contracts for the years from 1907 to 1912, and the contract price per linear foot for the complete sewer pipe; and will also show the deductions that are made and the reasons there made from that complete contract price per foot to get the quantities shown in the column entitled "Cent's Price less Pipe and laying per linear foot, exhibit "439". I can explain those reasons all except as to the amount. The price for the sewer pipe, per linear foot, that being the way the contracts appear to have uniformly been let is for the sewer complete, consisting of a vitrified clap pipe laid in the soil at a profile furnished by the city engineer, and according to specifications drawn by him. The contractor must provide the pipe, he must dig the trench and lay the pipe in the trench and connect it all ready for the sewage to flow through. The object of the tabulations in exhibit "439" is to show the price
1695 per cubic foot paid to the contractors for the trenching and replacing of the excavated material in digging these sewer pipe trenches; so it is necessary to estimate and deduct from the total contract prices per linear foot of complete sewer the fair amount for the cost of sewer pipe itself that the contractor must furnish, and the fair estimated cost to the contractor of laying that pipe in order to get the remaining amount which will show the contract price of trenching, including any profit on the whole transaction. Now, the figure for the linear feet of sewer as shown on exhibit "439" is multiplied by the cents which I have derived and placed in the column under heading "Cents Price Less Pipe and Laying Per Linear Foot".

I am now talking about exhibit "439". The multiplication of linear feet of my estimated price, laid per linear foot, not the full

contract price,—that is the total price as I estimate it of that part of the work which consists in digging the trench and re-filling it again, removing the surface dirt, if any; in other words, doing all of the work connected with the transaction excepting the laying and the hauling of the pipe. Whether that included the pipe itself,—I answer that the pipe itself we would not class that as work but as material. Of course you must furnish the pipe and cement, and jute and connect it up. I got profiles of all these sewers and had the average depth of the sewer computed on each job,—not the average depth of all of the jobs,—but just took each job of which we had a continuous profile, and computed the true average depth of that job. I got the depth of each job separately so we could get the cubic feet per linear foot for each job. I got the cubic feet per linear foot and multiplied it by the linear feet so I could get the total linear feet for each job; that total cubic feet for each job was divided by me
1696 into the total estimated price to get the cents per cubic foot.

I have summed up the cents per cubic foot which the contractor got for doing all of that excavating work for each year, for the sewer contracts in each year; another word in explanation of exhibit "440". Exhibit "440" will show what I have not been able to show in exhibit "439" for lack of room, viz., the average depth of each sewer job so that anyone wanting to check this computation will then have with the two exhibits the given material to check it. To get these cubic feet it will be absolutely necessary to know the average depth of that sewer. Explaining these cubic feet I will also say that I have assumed for the trenching for the gas pipe of the Lincoln Light Company for pipe of the same nominal diameter. The specifications call for a somewhat wider trench for this sewer work, but I have estimated it on a width that I have estimated it for gas trenches; that is, for an 8-inch gas pipe I have taken the same width for the sewer work that I have estimated and shown in my schedule of valuation for an 8-inch gas pipe because I thought perhaps the comparison would be a trifle fairer that way; at least there would be less points to contend about; I also think it is a fact that in digging these trenches while they are required to be a little wider than I have estimated, I think the tendency will be to let the contractor have a little leeway in that respect so long as he got the pipe down in good shape. I am now speaking of the sewer contractor. I am saying what I assume contractor would be permitted to dig the trenches of the same width as I have estimated for the gas, in spite of the fact that the general supposition at the City Hall for that calls for a slightly greater width,—my recollection is that the specification calls for two feet,—I have estimated for
1697 1.9 feet wi-th of this sewer pipe work. Of course many of the trenches are quite deep and it gets down very frequently to the point where you have shoulder room to work in, which is a very different problem for a trench, if you have a man working in there whether working hip deep or shoulder deep; when he gets shoulder deep he has little better room to work in but I have taken it at the same width as I have for the gas pipe of the same nominal diameter.

For 1907 I found that the average cents per foot which the con-

tractor got for handling material out of the ground and for his profit at 1.73 cents per cubic foot as estimated by me, that includes the labor and profit apart from the other items that I have previously included.

For 1908 the price per cubic foot was 1.33 cents, and it is to be borne in mind that these sewers, many of them, are running 5, 6, 7, 8, 9, 10, or 11 feet deep, all given there. I am not saying they stuck at one point or another, but they run along through those depths.

In 1907 the linear feet of sewer corresponding to the 1.73 cents per cubic foot of earth in the trenches was 4,775 linear feet; in 1908, 8,764 linear feet of sewer were contracted, and the resulting figure for the trench is 1.33 cents; in 1909 the linear feet of sewer was about six miles, 30,015 feet, and the average price per cubic foot of earth in trenches, including the profit, if any, as I estimated it, was 1.04 per cubic foot which corresponds pretty close to the previous year which was 1.33 cents.

In 1910 the amount was very small, only 769 feet; that was 1.37 cents per cubic foot; in 1911 the linear feet of sewer was 3,494 feet at an average price per cubic feet of 1.34 cents. I call attention to the fact that this average is a true weighted average for the
1698 price per foot. While we didn't average the depth of the respective jobs we did get the cubic yards of all the jobs, and added up the total amount for this class of the work as I estimated it, and divided that total in money by the total feet so we got the weighted average price.

In 1912 the linear feet of sewer is 5,133, and the resulting price as I computed it was 1.66 cents.

In 1913 I have a record here of 15,572 linear feet of sewer, and the resulting average price per cubic foot was 1.44 cents.

1699 That completes the respective years, and bringing all of those year- together I have a total linear feet of sewer construction under these contracts of 71,522.2 costing at that portion of the contract price which I apportioned myself to the digging and refilling of the trenches, $15,638.18, those trenches containing as I estimate it 1,082,016 cubic feet, leaving off the fraction, and that amounts to this whole amount of sewer trenching, on the basis that I have computed it, to 1.44 cents per cubic foot calling attention to the rate which I have allowed for trenching for gas mains in the unpaved streets at a much less depth than this, namely, 1.51 cents as compared to this one 1.44 cents on 71,000 linear feet of sewer. As to where I got my price as to the cost of pipe, I got it from the quotations on the cost of sewer pipe from the city engineer's office. The city has in a number of cases at different times taken prices of vitrified sewer pipe, and I got copies of quite a large number of those quotations, and then for the laying and joining of the pipe which I had to allow for, I allowed the same amount that I have allowed for the labor of laying and joining the materials of gas pipe; I have run right along to a gas pipe proposition. To make the point clear I allowed the same amount for laying and joining 8 inch sewer pipe that I allowed for laying and joining an 8 inch gas pipe. I think it is fair and none too much. The sewer pipe

of this size comes in standard lengths of 2 feet and the gas pipe in lengths of 12 feet, so you have just 6 times as many joints to take care of or make for the sewer pipe. I have assumed that they are not so expensive per joint, you have to account for the laying of the pipe, and I think to take the whole thing together that my allowance for the pipe for laying gas pipe is a fair allowance to make for the laying and joining of the sewer pipe and that same figure is what I have used, as shown in my exhibit that I will furnish on this point. Exhibit "441" is a letter from the city engineer
1700 of the City of Lincoln, Mr. Adna Dobson, the letter contains information that was compiled in Mr. Dobson's office at my request and solicitation and reads as follows:

"March 4, 1914.

Mr. Alton D. Adams, City.

DEAR SIR: I find there are 27.06 miles of allies running parallel with the paved streets in the City of Lincoln. There are 4.81 miles of allies paved in the entire city.

Yours truly,

ADNA DOBSON,
(B.) *City Engineer.*

(Witness continuing:) It appears from this letter that while there are 27.06 miles of allies running parallel with the paved streets in the City of Lincoln, there are only 4.81 miles of allies paved in the entire city. It would appear probably to me that the greater part of the paved allies would be parallel with the paved streets, but it does not follow at all that all of the paved allies are parallel with paved streets; so that if unpaved allies were considered as possible or probably available for gas pipe laying, it would not follow that all of the 4.81 miles of allies paved was to be deducted from the 27.6 miles of allies running parallel with paved streets. But even if the entire 4.81 miles of allies paved in the entire city are so deducted it leaves 22.25 miles of unpaved allies running parallel with paved streets in the City of Lincoln. I have investigated these facts for the purpose of determining the practicability as far as paving is concerned of laying a set of gas pipes in the city in the allies or any part of a set of gas pipes in the allies.

1701 Exhibit "441" offered and received in evidence without objection.

(Witness continuing:) I am very familiar with the practice of the Massachusetts Commission in the matter of what they charge into the account of the item of repairs and renewals appearing in the reports made by those companies to the Massachusetts Commission, through long study of the returns sworn to by the companies and filed in the office of the Commission where those charges are made, and through my study of the documents, drawings, etc. that appeared in the numerous years before the Massachusetts Commission. Relative to the issue of securities which involved a study of the property involved and through a particular investigation of a number of the gas plants involved. I have a very con-

siderable knowledge of the situation as to the things and costs that are charged under the heading of "repairs and renewals" in the cost sheets of the returns of the gas companies to the Massachusetts Commission.

Plaintiff asked to state what the nature of the item charged in these returns under those headings is. To which the plaintiff objects as not proper rebuttal, and no proper or sufficient foundation laid. Which objection was overruled and to which the plaintiff excepts.

It has been the custom in the making up of the returns in many of the Massachusetts gas companies for a good many years, as I know from the source I have indicated, to include not only ordinary repairs in the repair and renewal charges, but also very widely differing amounts of the cost of actual extensions to the property; that is while some companies have charged in to the repair and renewal account only small amounts of extensions to their plant over and above the ordinary repairs to keep the existing plant in good condition others have charged in very large amounts, representing extensions of large cost. Companies doing that are in particular those that have
1702 been making more money than they thought it expedient to pay out as dividends, at least that is the information I got from a study of the thing and long familiarity with it, because of the possible result on the public mind and public knowledge of their true earnings and so they have chosen rather than pay it out as dividends to invest it in the additions of the plant that *they* were required and charging it in the repair and renewal account. Asked what effect that has on the operating accounts of the company.

To which the plaintiff objects as not proper rebuttal and incompetent, which objecetion was overruled, to which the plaintiff excepts.

(Witness continuing:) The effect on the operating expenses of the companies in question is, where abnormally large amounts are charged under the heading of repairs and renewals for large extensions to property to swell or extend beyond any proper amount the report- operating expenses of those companies; and it is common to find in annalizing the operating expenses of the Massachusetts Gas Companies, especially in the more prosperous companies to find very great variations in different years and between different companies in the amount charged to repairs and renewals. And I know from repeated investigations of those differences it can be traced back many a time to large extensions pure and simple that have been made to the property. I have known it to be testified to by the manufacturers in at least one large plant back there in a hearing involving his property, that that was his actual practice to charge a large amount of what he was putting in to repairs and renewals for actual extensions, not renewing any or repairing any but building a larger plant or additions to his plant. I explained the reason for that, that the companies were making more money than they thought expedient to pay out as dividends, and they can

not increase their stock to meet the extra earnings that they
1703 are enjoying and being afraid to pay it out as dividends
the most convenient place to put it is in extensions to the plant that their business makes desirable for them to have. They have it there, and that is the best reason I am able to figure out from a pretty long study of the situation, and I think that is the one that is pretty generally accepted as the main moving reason for that sort of conditions. For that very reason any comparison set up as to the operating expenses of Massachusetts gas companies and other companies, would have a very minor value until and unless it included an investigation as to what had become of the sum charged for repairs and renewals, particularly if those sums happen to be of the larger sorts that we found in Massachusetts plants, reduced to thousands of feet of gas sold, because that is much the more convenient way to get a comparison between different companies. The minute you reduce their expenses to the thousand of feet of gas sold you get a basis of comparison that shows you somewhere near where you are at, and what the companies are doing.

On cross examination I was asked if I excluded meters in stock from my valuation; the reason for the omission of meters in stock, which if included would be likely to come under the heading of "working capital", is doe to the same reason that gas pipe for construction, for instance, in stock is excluded, namely, that to include it would be calling upon the consumer to pay interest or return on the cost of an article during a certain period while it was carried as so called "working capital", and then when you begin to put it into the plant it would be expected to be capitalized; that is, to put in as a part of its cost of the plant and interest charged on the cost of the materials or article either pipe or meters during the same period of time that it also had been carried as "working capital"; so that for the same period of time the consumer would
1704 be asked to pay a return on "working capital" for the value
of the thing in question; and then for the same period of time when the thing was put into the plant and became part of the structure he would be asked to pay a return on the capitalization of that interest for which he had previously paid. It must be remembered that every item of property in this or any other plant is at one stage of the plant progress out of use and waiting to be put into the plant so that this condition I mentioned of having a return first on the thing, say during 3 or 6 months during the year 1907 as the case may be, if it should be thought to be out of use that long as "working capital" and then a capitalization on the interest during that same 6 months, which would apply to every item of property in a plant, that is, getting a return on it once for the time it was out of use as "working capital" and then getting a sum equal to that return put into your capitalization, or under capitalized plant value; that is what it would result in and that is why I do not include the meters.

Asked if I noticed anything in the corporate records of this company as to the statements concerning payment for services by consumers,—the corporate records to which I refer are those marked

as exhibit "K" in the printed report in the case of the Lincoln Gas & Electric Light Company against the City of Lincoln as reported in volume "223" of the United States Supreme Court Report. This book as it came into my possession is a book entitled "Corporate Minutes" was lacking in its pages from 55 to 66 inclusive, and also from 71 to 74 inclusive, I find in this book of Corporate Minutes, the following entry at page 24 at a meeting of the directors June 18, 1872; "On motion of J. N. Cassell it was ordered that the consumer should be charged with the service pipe," I take it, I am pretty sure that was the reading in the original record, I have it here "surface pipe", "from the curb stone or outside of the side walk, provided the- make application before or whilst the
1705 mains are being laid, after that they must pay for pipe from the main."

By Mr. Strode:

It is admitted that the gas company only pays for that portion of the paving that is opened for the purpose of putting its mains down, or services or for the purpose of repairs its mains or services, and such cases it is required to pay the amount that the city determines the company shall pay, which is usually controlled by the contracts between the city and the contractor who lays the paving.

Being asked if in my valuation I deducted anything from the total by reason of the use of the Lincoln plant for the benefit of the consumers located in Havelock, University Place and the State Farm,—

And the objection of the plaintiff as not proper rebuttal being overruled to which the plaintiff excepts.

(Witness continuing:) I would say nothing whatever, except that I have omitted the items of property consisting of the East Lincoln holder and the buildings and such machinery as is on that plot of land. I have deducted nothing, in other words, from the mains or from the works, although the works and mains to some extent are used for the supplying of persons in Havelock, University Place and elsewhere, perhaps. I have just omitted the East Lincoln holder and the other items of property on that plot of land and the land.

Redirect examination by Mr. Morning:

Being asked if in my investigation of the general expenses of the gas company here if I have seen any figures derived from the company's reports in the Electric Department, to ascertain whether there has been a corresponding increase in the expenses there, or whether there has been a decrease in the same item,—I would say we
1706 have some figures prepared by one of the assistant accountants on that point, which shows that instead of being an increase per foot of out-put in the Electric Department there has been a decrease running down through the series of years that we are interested in here from 1907 all along down. Under ordinary circumstances and the same general conditions prevailing I should expect the cost of the general expenses indicated would decrease somewhat

per unit of out-put as the out-put substantially increased in the electric supply.

To this line of testimony the plaintiff objected as not proper rebuttal, not the best evidence and incompetent, to which there was no ruling.

(Witness continuing:) Asked as to what that fact indicates to me as to the division of the common expense of the two departments,—I would say I could answer the question more precisely if I had before me the dollars expense rather than expense per unit of out-put in considering any division of the expenses between the two departments, but roughly I should say, without such figures before me, that the increase per unit of expenses or the general items in the gas department, and their decrease in the electric department, would at least put me on inquiry as to whether the devision of the total general expenses of the company was fair between those two departments; I should be led to suspect that it was not.

Exhibit "442" is a copy of a photograph of meters that I had taken in one of the buildings served by the Lincoln Gas Company. It was Melick's Court which shows a bunch of meter connections.

Exhibit "442" offered and received in evidence without objection.

1707 Recross-examination by Mr. Strode:

Being asked whether I identify this photograph just referred to as a fair representation of the meter connections of this company in the City of Lincoln, or as an exaggerated condition and the worst one I could find,—I would say considering the number of meters and what I should consider the attendant fire risk, it is the worst situation I have seen. The property is in no worse condition, it is the worst I saw, but so far as the fire situation is concerned and all of that sort of thing it is the worst I have seen in a good while. I haven't changed the value of the property on that account. I offered this exhibit as bearing on the cost of installation of those meters and the connections and the expense of making the connections of those meters. I do not think those meters would represent the fair average case of installation of meters here in the city. I think that represents the older and poorer class of the company's work. However, that would not affect the cost so much as it does the general quality of the work; you could do a great deal better work than is done in that bunch without increasing the cost any.

I did not succeed in finding the details of the 1.40 on meters, covering items of fittings, connections and setting, freight, etc.; I could give the figures for that, but I was anxious to find the original data that I made up on that if I could. I think I wasted half or three quarters of an hour that way tonight but didn't find it.

In my estimate of the different items entering into the installation of a meter I would start in my tabulation by assuming the cost per meter in Chicago. Being asked as to what items I would add and the amount of the items that I would add to the cost of that meter

from Chicago to the place I see it installed as shown in ex-
1708 hibit "442",—I would say I have not had time to study out an absolutely precise separation of that $1.40 I have allowed the company, but it would be something like this, remember that the $1.40 is an average or uniform figure applied to all the meters and that the cost of the smaller size would run under that, and that in a few meters of large size it runs over that, speaking with those limits I should say that the approximate cost would be for the meter cost for the meter connections themselves, that is the actual pieces with which to connect the meter to the basement pipe, not over 70 cents; the actual labor of setting the meter,—of course I am speaking of setting them wholesale,—and carting them from the depot and getting them to the places of installation and installing them, apart from the cost of making up these pieces that I will call meter connections although that is a more or less used term would be in the neighborhood of not over 40 cents per meter setting that large a number of meters in, that would raise you to not over $1.10 for an average figure, and the remaining 30 cents would be more than sufficient to cover testing and freight from Chicago, there would be a little left over for any possible small items that might not be included in the matter in the way I have separated it. As to the weights of the average sized meter, how it is shipped and in what form shipped,—meters are commonly boxed up when they are shipped. I don't remember the weight of the average tin meter, they differ, whether they are of tin or cast iron, but the company are using nearly all tin meters as I understand. I do not know the freight rate. I feel that without knowing the weight or without knowing the freight I would be justified in fixing a figure covering the item of freight as long as I have fixed it as large as I have in this instance. I do not know
what the rate between Chicago and Lincoln per hundred is.
1709 That would make a difference in the item of freight but I have allowed enough to amply cover anything I think it could possibly be, in my opinion.

As to what is involved in testing a meter, you have to see that it measures correctly the gas passed through it. I have forgotten where the company's meter tester is I think it is down to the meter shop but I am not sure about that. That would involve the take of the meter from the car to the plant for the purpose of testing it, if you did the testing down there as you might well enough do. It wouldn't be practicable to test it at the place where it is to be installed, of course it could be done, you could take a test meter there and test an individual meter but it would be a very expensive and inconvenient way to do it. I don't know how much time would be consumed in testing a meter. It is a very short process; you might allow 10 cents or something like that for the testing. If it is found to be inaccurate whether it would take any amount of time to correct it,—I would say a meter that is badly out it would, of course in buying meters you would make a proper investigation to get meters within useful limits, and if they did not the manufacturer would have to stand it; You don't buy bad meters, you buy good ones. Assuming that you buy good ones and that they do need correction and that is the pur-

pose of testing them to be certain that they measure correctly, I would say that I included that for any ordinary adjustments in the 10 cents; take 10 cents a meter on this large number of meters we are dealing with here. Remember it is not like testing a few meters when you do that. I am looking at the whole thing from a wholesale proposition when dealing with a reproduction proposition. I would figure the meters coming in in car load lots switched right up to the company's side tracks, and unloaded on the ground and there tested in wholesale lots. That is what I am talking about. And in a situation like I would contemplate all the meters you see in
1710 this picture would be installed as one job, all taken there at one time and put in, I would consider that the meters would be put in by a team of several men keeping right at it for the working hourse of the day, keeping right at it going right ahead. Whether at that particular place I would expect continuous work there from the time they started until they completed installing the meters that are in sight on this picture, that would reduce the expense of setting each meter,—I would say no it wouldn't they wouldn't necessarily do that kind of a job nowadays, and in the second place they wouldn't necessarily stick all of those 13 meters in there at once, I don't say that they would set the whole 13 of those at once, perhaps they wouldn't get in the inception of the business 13 meters in one bunch. It is more common than otherwise to place meters in the basements. Perhaps the location of a meter on the side of a wall is not a practice to be condemned or is not an unusual practice; it makes a good deal of difference how you locate a meter. You can hang meters up in a bunch like that, with lead connections, their entire weight hanging with lead connections and no side support to prevent the bending of the lead connections you are making, what would be considered a pretty bad job. It doesn't detract very much from the value of the thing, but as a job existing there I do not think any man who knew anything about the business would say that was a good kind of a job of that kind. It could have been done a good deal better at a very little if any more expense. The engineering charge ought not to be any more on that, that ought to be right; but then I have allowed the full 7%. In the 70 cents for connections I involve the pieces, either lead or iron pipe, partly of each as you use it here in Lincoln, length ordinarily from 15 to 18 inches would suffice for the average purpose, on each side of the meter connected to the basement pipes. As to how long I
1711 would think it would take ordinarily to set a meter not in wholesale lots, but to go down and get a meter at the plant or wherever it is and take it out and put it in,—I couldn't give any answer to that at all; that has nothing to do with the reproduction of this plant in my mind. It would have nothing to do with the present value of the meter; one wouldn't have very much of any bearing on the cost between retail and wholesale construction of that particular line of work, it is so large that I would not think of the cost of going to the plant and getting one meter and taking it out somewhere would throw much of any light on the cost of setting 8,000 meters more or less as they have here as a wholesale proposi-

tion. It is not my basis of calculation for the reproduction of the property to assume that I would get my mains laid and my services constructed and the place to put 8,000 meters in the basement in one job; I do not assume that. I assume the placing of those meters on a wholesale basis, and by that I mean that you would be able to start a meter team and keep it going day after day, not running down to the plant after one meter but hauling out just as many meter- that could be conveniently handled by that team and making a day's work of it, after you kept that up for a while you might have to put the team and the men on to some other work for a few days and then start metter setting again. Meter setting is more or less skilled work. You can not take men out of the trench and make meter setters out of them, not trench diggers you couldn't. You might have men who could connect some of your large amount of screw pipe in the trenches that would know enough about meter setting to make a good job of it, that would be perfectly possible and practicable to employ men connecting screw pipe in the trenches, for instance part of the time and part of the time on meter setting work the other part of the time. That is an important branch of the service requiring careful and intelligent work, I am considering the work all
1712 properly done by skilled persons, and I would suggest that it ought not to be, if it were not it might result in serious injury to the property. In the matter of having a meter tested I would assume that the company would employ skilled men to test those meters to see that they were correct; that would be quite as important as to get the meters out in wholesale lots.

I couldn't give the difference in the weight between the larger and smaller meters that are in the service here. I could not give any idea as to whether the larger sized meter would weigh twice as much in my opinion as the small ones. I do not think that just making a flat price of $1.40 applying to all classes of meters is rather a rough way of getting at the details of that item involving the installation of 8,000 meters; I think it is reasonably accurate, not an unheard of or an unusual way of getting at it, remembering that while there is quite a range in the size of meters running from 3 light up to several hundred light capacity, that the percentage of larger meters is very slight indeed compared to the whole number. Whether the percentage of the small meters is equally small compared to the whole number, I should say the meters of 5 light and under would make up the great bulk of the whole proposition; above the 5 light meters there is a very small percentage. The 3 light and 5 ligh' make up a great bulk of the meter purposes or meter number.

Referring to exhibit "429-7", I was asked to find the figures elsewhere under the heading "Other Expenses", against other parts of other tables shown in this printed report from Massachusetts, if I could in connection with those companies and I found them. I think that the fact that the quantities in dollars is just the same amount here in the profit and loss column, together with my knowledge of the way those records are kept, and together with the heading

of the tables to which attention was called, indicated strongly
1713 that the items corresponding exactly in amount that I found in the profit and loss column were the same items that were read to me in the question. Of course if I had resorted to the original returns as to those item- it could be determined precisely where they came from if I had chose to take the trouble to look, without any doubt whatever.

Asked if for the town of Boston there is shown in exhibit "429" under the expense of manufacture, coal, enricher, purifier, water, wages, repairs, maint*ai*n*e*nce, renewals, apparatus and machinery, that will be the total cost given; then for the distribution expenses, wages, repairs of mains and services, repairs and renewals of meters, gas stoves, public lamps, and other expenses, whether I find in the report for Boston in that portion of this printed volume referred to, the amounts that cover these items of expense referred to,—I would say I would think they are all in here in total, but not set out under those headings counsel has mentioned, but they are in total for the expenses of manufacture and expenses of distribution, it is there in total seg*g*regated, one separate from the other under the heading "operating expenses". The operating expenses as set out on page 52 A of this printed report to which I have been referred for the operating expenses for the Boston Consolidated Gas Company are set out against the following headings: The Works, For Gas Bought, Distribution, Management, Taxes, Incidentals, and the Total, indicating the total operating expenses as set up and corrected by the Board of Gas & Electric Light Commissioners. The office and other operating expense is in there, but it is not seg*g*regated into the items that this company has in them. The items "Office Expenses, Taxes, Miscellaneous Expense", are all in here under one of the headings. Being asked as to what is understood to be included under the item of "Management" as reported to the Massa-
1714 chusetts Commission, and what would be included under the heading of "Operating Expenses", to-wit, "Management"—I would say according to the form in use for June 30, 1913, which is very nearly if not exactly the same as the one for 1912, according to my best recollection, on page 8 of the sheet form of return being headed "Statement of Income and Expenses" and there occurs the heading "For Office Expenses and Management", and that is the sub-heading, and under that still further are set out headings of director's allowance, with the sum of money of course following; salaries of officers, general salaries, rent of offices not owned by the company, and repairs and maint*ai*n*e*nce of office, buildings owned by the company, general office and management expense, and then there is a footing indicating that the heading of office expense and management includes in the classification adopted in this form the report of items which I have mentioned. Asked to identify in this printed form where I looked for profit and loss, and took certain items for an*n*alysis from those reports as shown in exhibit "429" and point out in the report here with respect to the particular item in the profit and loss account certain items that occur in exhibit "429". And asked to show where in this report that con-

tains the profit and loss account where I will find the "office expenses", under what heading, of any one of these companies,—I will say they do not enter the office expenses under profit and loss, that is not good bookkeeping. Asked where it is included in this report, I would say by taking still the Boston company on page 52A we have management in here amounting to $282,580.04. I consider they do include the items that I have read here, office expense and management. I have correctly stated to counsel that the items in the exhibit he speaks of are not set out in greater detail than the items are set out in operating expenses as appearing in these balances and which I am giving him the heading of "management" here, which includes certain of the main subheadings. Office
1715 expense and management are run together as a single heading in the return to the commissioners. Asked if there are any other sub-divisions of this balance sheet referred to that would give me part of the office expense,—I would say the office expense as classified by the Commission, would come under this heading, "Management" on page 52A, that would come in as a part of the sum and set against, "Management". That is the only place that I know of to look for the office expenses, right in there under "Management".

Asked to take the second town Brockton on the list and identify the item of "other expense" as shown in exhibit "429" in the profit and loss account,—I will say that I do not find in the item "other expense" as to Brockton the item "631" appearing in other expense in the sheet of Brockton in that amount; I find another item there, but it is not for the same amount. I find one item in the profit and loss account of $461.14.

Turning to the item of "management" under "Operating Expenses" for Boston, and asked to show what the amount is there to have been expended for office expenses,—I say it is not shown here, it is in with other items. The amount here set against, "management", which I think probably includes all the office expense chargeable to the gas business, was $282,580.04.

Turning to exhibit "429" under the title "Office Expenses" I find this shows an office expense for Boston for $32,247.80. It is in the same volume whether it is in the same year as referred to in the balance sheet where I gave the "management". I don't suppose the same items are referred to; they evidently do not correspond.

1716 Asked if that "management" in this balance sheet takes care of the item "Office Expense" in the exhibit "429", then either they have made a mistake in reporting the amount in exhibit "429", or there has been an expense made in entering the amount under "Management" and I am mistaken about the account,—to which I would say I have made no particular study of this tabulation, it is not a part of the Massachusetts system at all, but is simply a tabulation made up out of these balance sheets which do represent the Massachusetts system of bookkeeping, I don't purport to know precisely. I found them in the profit a- loss account, the items corresponding in amount, and so stated the same number of

dollars. Excepting in Brockton, the second town, and if you had the original return you could see where it all came from and it is all seggregated out there, in the original report, such as I have here in Taunton, that is a sample of it, that is what these printed "reports are made up from in balance sheets as corrected by the commission.

Asked if I refer-ed to the matters of repairs and renewals in Massachusetts and said that some of the companies in Massachusetts were in the habit of covering up their earnings by entering as renewals or repairs what were, in fact, extensions,—I will say that may be a fair sample of what I said, that is the substance of it. Asked whether I think the Commission knows that that is what is being done,—I would say it is notorious. I don't say the commission is a party to it, the commission is not a party to it, and does not attempt to dictate to the companies at all, it does not go into their accounts to find that out; they have told them what to charge before, and it is notorious that the companies charged a lot of extensions in there. I don't think at all that the commission allows the company to charge whatever it pleases and keep whatever account it
1717 pleases, but it is a matter of judgment what you shall charge into the repair and renewal account; and as a matter of fact, I have told you the fact that that is the way the thing works. I have copies of testimony given before the commission. The statement asking whether I think I am doing justice by the commission of Massachusetts in saying that they would permit extensions to be carried on those accounts under the name of Repairs simply for the purpose of allowing an increase of capitalization and increased earnings in the community where the company was located,—I say counsel is putting on a lot of stuff I have not said and I will just stop right there by telling you I have not said it. I know the commission knows that this practice exists in Massachusetts; it is brought up repeatedly in the hearings there; there is no "think" about it; it is just as well known as any practice could be, and the commission can't help it. The commission cannot indicate when a thing is reported as a renewal or repair and should have been an extension, they cannot help themselves so far as that company is concerned. whether they can change or direct that that item be entered as it should be entered in the returns to the commission,—I say the trouble would be it would require an army of accountants and engineers to chase up the fifty companies to see what they entered as a "repair" or as a "renewal" and whether it was, in fact, an extension; it is the practical enforcement of a regulation of that kind on a matter involving as much judgment, engineering and skilled judgment as that does, that makes it impossible and impracticable for a commission to enforce a rule on that matter. Asked if they have not got the time in Massachusetts to see that those companies
1718 make a proper report as to whether the money expended is for repairs and renewals, or for extensions, and whether I think they have sufficient time to check over and determine whether the items expended for the operation of the plant and are properly entered and applied to the things that under the classification they

assume to apply it,—I say not generally by any means, unless the item shows on its face where it should be classified, then they have time right in their office to so classify it, particularly in making up their own reports based on that report, for the item shows what it is on its face. It is different from going out and investigating the construction work of a company. There is nothing about the form of entry required that would put the commission on notice, for instance, if a company would report as repairs the extension of mains for a couple of miles and enter that on the report, that the commission would take notice of it and direct a correction. Asked to assume under the item of repairs of mains and services if the company should report that it had extended its mains for distance of two miles, if that was written into the report by the company the commission would take notice of it and require a correction.—I don't think I am called upon to guess as to what jurisdiction the Massachusetts officials would use it I have told how the charges are made,—I am not called upon to guess as to what powers they would exercise under a given contingency. The company does, as a matter of practice, exercise a good deal of discretion in making out its report, and that is particularly an extension, so in the indirect matter of repairs, renewals and extensions, where the form of the report does not reveal on its face very well what has happened to the physical product. Possibly it reveals quite as clearly where it says on their report "Salaries of Officers, and Other General Salaries, 1719 General Office and Management Expenses", it is quite as definite as those headings for the expenditure of money; I don't understand that there is any particular trouble of dispute about that. Counsel does not claim but what I have shown on that report for salaries of officers, you can tell from the report if you go back to the original report if you make a correct copy of it. I offer those reports here, for a certain group of items simply to prove that the company has extended a certain amount of money for a certain item. It was not solely to prove that I could make a correct copy of the reports that I submitted those, that was involved, of course, to have a correct copy in order to show anything that the copy proves.

There is a general specification in this general form that requires the company in its return shall specify particularly what additions, alterations or improvements have been made in the property of the company since the last return; I will not say it is precisely in the words counsel has read, but it sounds much like it. Assuming what counsel has read is found in the report, I would say that the company then would report, if these reports are of any value at all, they would be obliged to report what additions, alterations, or improvements, had been made in the property of the company since the last report; those are valuable facts. I had a large collection of those from a great many years, I have devoted a great deal of time to that. It is a gross mistake to say that the real fact is until some rate came or hearing comes up where the commission is called upon to determine the value of the company's property that those reports are not considered of any value whatever by that commission for any

1217

purpose. Asked whether I think that that commission upon
1720 a rate hearing before it receives those returns and considers them as the evidence of the amount of property that the company has,—I say I think they are received as evidence of the amount of property; receiving the reports as evidence of the amount of property the company has is a very different thing from receiving as true the statement of expenditures of a definite number of dollars for operating expenses. Those reports are undoubtedly received as evidence, to say that they are received as conclusive evidence is quite another thing. The commission relies on the records of a company in its office and on the statement that the company brings in itself almost entirely, and that has been especially true in the last 25 or 26 years.

As to what this hearing in the Haverhill case was about and why engineers were called in there for those reports speak fully as to what the company had and what its hearings were,—I would say that I know of the Haverhill case before the commission, and I know of no engineers being called in on behalf of the commission. One of the engineeers is himself an engineer and is by training and by profession an engineer and I didn't know until just now that the commission called in any engineers in the Haverhill case before it, which hearing I attended to the extent of 27 hearings during the year 1911. The company itself presented a number of learned engineers, the commission could not help that, they like to hear them. They were not responsible for what the company brought in. Sounsel started in with the allegation that the commission brought in its engineers, I tell you it is not true. Whether the company itself and the petitioner present engineers that their report and criticism of operating expenses and value of the property,—I say more commonly than otherwise that has not been true. That was true in the Haverhill case; that was a
1721 large and very important case. The petitioners in that case depended upon the reports not entirely to present their case to the commission but very largely. I was myself engineer for the petitioner. Whether I went back and valued the property and examined the accounts and criticised them and did not depend upon a report,—I say I did depend on a thing like that, and I relied on the statement of the company as to its operating expenses. I did not go to the company and check up its expenses to determine whether they were correctly or properly reported to this commission; I took their sworn reports to the commission. I never examined the company's books as to their operating expenses. I examined some of the records for property or plants, but as to the operating expenses I took it as they reported to the commission. Of course, I don't agree that all the items they said they had spent their money for were proper items. I thought they had spent too much for management but I accepted the terms just for a truthful statement of the — spent and for the things they said it was spent for. They did not have simply that kind of a report that I found in the Massachusetts report; they had a- original report and not a mere compilation showing a part of the facts they could get in the original

return; that was what I went to when I wanted to find the facts, and all of them. I could find them in a report like that about the operating expenses. I most certainly did not go back to the report like that, on that same form (indicating) in the Haverhill cases to get the operating expense and the particular income of that company; I mean by that to say I did not go to their books to see if that was correct transcript; I don't mean to say that I didn't criticise the amount of some of the items reported.

1722 Being asked to read the heading under which I have classified these different items that I have put into this tabulation of Massachusetts I read as follows: I will take Cambridge for 1912; "Meter Reading and Collecting" is one of the headings, "Salaries of Officers and Directors", "Other General Salaries", "Advertising", "General Office Expense", "Care of Street Lamps", "Material and Other Street Lamps", "Distribution, Tools and Appliances", "Rent of Offices", "Insurance", "Law Expense", "Claims", "Meter Connections", "Stove Connections", "Fixing Gas Stoves", those are the items that I have abbreviated from the original sworn returns for Cambridge for the year ending June 30, 1912. The expense items I have included in my exhibits, are all found within the first 28 subdivisions of this report, according to the form of return for the year ending June 30, 1908 under the heading "Expenses for Manufacturing of Gas" on the one page, but as I have before explained, there are frequently, sometimes, interlined, sub-headings of expense which the company does not know just how, or where, to enter under this printed heading and they interlined it in there so the exact nature of the expense may be described. I would not dare to speak from memory and state that the form I am referring to is a form that was also used up to and including 1912; the form has changed but little in these recent years, but I would not dare to testify it is precisely the same. I am not questioning that it is. Asked if the only change in the form I know anything about was in 1913,—I say No, meaning from 1908 to 1912,—I say I cannot testify that there has been any other change, I don't remember it if there has been in those later years.

1723 Asked concerning explanation in my testimony covering item "Other Expenses" and the explanation that I made with reference to that item "Other Expenses" not being contained in the report,—I think that is true not only of that but of any item of expense you find in there, there is no long explanation of it, they were written down, you can look in different places and find them. In the return the expense is set down and is required to be set down as to the thing it was incurred for, but when it comes to making up this printed document of their own they cannot repeat all of those descriptions in those itemized expenses, and they don't attempt to, and the place to find out what money was spent for is in the return of and company that spent the money. Whether you can find out what they spent it for for sure,—I would say circumstances alter cases; it is a valuable place to go if anybody

really wants to find out they are pretty apt to find out; that might concern even *item* items they cannot find out about. Asked if in the incidental expenses you could not find out from that what it was spent for,—I say, did you notice those nice little lines set in there for people to write down what the incidental expense really was; and I have quoted some of those pages, a number of them right in my copy. I quoted what I found there. Various things. For instance this "Advertising" was probably there. I can't tell you what I found there. I told them I took all the entries I found in there. Now, as to what entry I found in the original return for a particular year on a particular line I can't tell you, I took the entry whatever it was. Here is a copy of the report, I can tell you just what is written there, on the incidental expense it didn't have anything so we did not write any for that company; whether the other one had any incidental expense or not I don't know; the line I am talking about may be estimated to be about 2½ inches long,

1724 I would not say that it was not. The line suggested was not made for figures as I know now by looking at the return, and as I have known for many years by seeing what is written in it; it shows on its face that it is a line made for a description of the entry. Whether that is more than three inches long,—I don't dispute the length and I don't want to be captious about it; it is no place to put figures evidently. Fortunately I can furnish one that has some writing in there, to see how definite the information would be I have here the form of the Haverhill case company for the year ending June 30, 1913 and under the heading "28", "Incidental Expense Namely", that is, namely "A. Advertising", "And so much money, just similar to the advertising I have here for the Cambridge company in 1912 which I did not doubt was taken from a similar entry, that being where those descriptions of entries not falling within these printed descriptions are very often and particularly if they are in the nature of a general expense. That means an Extra Incidental Expense, it says so. That might be most anything, only the idea is you will commonly find a descriptive word or words in there telling you what it is, and if a large incidental expense was written in there without description it would be pretty sure to call for inquiry from the clerk of the commission and it would be found out what the item was, and the description would be written in there, in the ordinary practice of that office.

1725 Returning to the item of "Renewals, repairs and depreciation"; I made a computation of the depreciation of this property from 1907 to 1912 year by year as counsel asked me to. The description is inaccurate when it says I did that by simply taking the property that I found in 1907, the particular items of property, and extending their life until 1912.

Exhibit- "431-5" shows the buildings in 1908, 1909, 1910, 1911 and 1912; it doesn't show the same buildings in all those years, the number of the buildings increases as the years go by. Here is the district holder, booster house that my assistant has in there with a depreciation, that should not be there at all, because I don't think

that that item should be included, but it is in there and I will leave it there.

I valued the property in 1907; I applied the 9 cents per M feet of gas sold as an ample amount to provide for all repairs, renewals and depreciation year by year beginning with 1907, and continuing on; it applies at this time and it would apply for future time, the immediate future anyway. I found the 9 cents amply sufficient to take care of repairs, renewals and depreciation in my opinion. I base the 9 cents on what I found by computation from my estimated cost of the property, and allowing what I am sure is more than enough to take care of ordinary repairs on top of that estimated depreciation and renewals arrived at in an entirely dif-erent way. Asked if the property was valued at double the amount I valued it at, whether then I would have to increase my 9 cents,—If I was convinced that the true value was double that I would say yes. There is a value here by Mr. Lea far in excess of mine. If I valued the physical properties themselves, at double the valuation I found, I certainly would have to increase my 9 cents. Whether the 9 cents is
1726 only a correct figure, in my opinion, provided the valuation of the property remains at the point where I fixed it, or approximately that,—I would say it is not down quite so low as that, because I have put in and allowed 9 cents I did not allow it until after I had made my depreciation and renewals along an entirely different way; I allowed the 9 cents with the idea of allowing more than I thought was necessary to cover any claim or dispute that there should be more allowed for depreciation on account of higher valuation; but still you keep raising the valuation and you would soon get past the point where 9 cents would be enough. Whether if you disturb the valuation you would disturb the correctness of the depreciation fund as provided by the 9 cents,—I would say you disturb the basis of your depreciation and renewal fund just as soon as you begin to change the valuation. If you disturb the life of the property that I have fixed you will disturb the basis for the depreciation fund, you will move it either one way or the other. I haven't shown 57 years as the life of the distribution system.

Assuming that is the figure; and that I fixed the composite life of the Works Equipment at 45.55 years as against Mr. Lea's 32.32 years; and that I fixed the life of the buildings at 62½ years, as against Mr. Lea's 46.25 years; now if the life of those buildings and that equipment and the distribution system was found to be as Mr. Lea reports it and determines it to be then my 9 cents would have to be re-adjusted. And if the court finds the valuation placed upon this property by Mr. Lea is the correct valuation then my 9 cents would have to be re-adjusted.

Now counsel has got the formula precisely when he says that that 9 cents as a matter of fact applies to the valuation of the property at the point that I fix it, with the life of the property as I fix it, only with the exception that I think I have explained, and that
1727 explanation should be given its weight, that I have put somewhat more into the 9 cents than my computation based on my

life and cost of the property requires,—or more than I think it reuqires; I have left a leeway there.

I did not intend to leave any portion there for contingency in the way counsel figures it, but I put in more than I really believe is necessary to keep up the value of this property and perform all necessary repairs. I did not put in more there than I feel I can justify, because I justified on the ground that we are dealing with a very important matter, and to my mind one that it is important that we do not do the company an injustice in, and these matters we are dealing in are not only important but are matters of estimate; I do not claim,—as I have been studying the matter for more than fifteen years,—to know exactly how long this stuff will last, and I justify putting in more than my computation shows because my computations are based on assumptions, the best I can make, but still they are assumptions, just as any man's computations in this matter must be. I certainly feel that the City is my client in this matter; that I am in the service and represent the City in this controversy and that I am giving the City the best services I have and in its interests, but that does not involve doing anything that I believe is unfair to the other side; I do not think that is the measure of proper services at all. I do not think I am called upon to volunteer information or opinions or judgments to this company for its benefit in this controversy.

Asked especially in view of the fact that I have participated in pursuing a vigorous cross examination of witness, that I would hardly be expected to turn around the next day and render assistance, even though I felt the facts if fully disclosed would be of benefit to the company,—To that I reply that I haven't considered any facts that I thought were necessary to the company, if
1728 that is what counsel is driving at. If you are trying to get my attitude, I am doing what I think is fair and right in the interests of the City, there is no question about that, to develope the truth as I see it for the purpose and in connection with winning of that law suit.

Concerning the sewer exhibit and data I brought in, and being asked if I don't think if, I had gotten and produced here the data that covers all the sewer contracts so that the whole matter might have been laid before the court, that that would have been a fair proposition,—I say no, I have taken all the pipe sewer contracts that have been executed and carried on here for a number of years, there is a limit to human effort, but I have shown dozens of contracts in the tabulation, I have not segg*r*egated them at all. What more could I do, I have taken them as I came to them.

Mr. Strode: The plaintiff reserves the right to furnish a tabulation from Brown's Directory corresponding to the subject matters covered by the tabulations presented by Mr. Adams from Brown's Directory; also to present tabulations from the company's record with respect to the cost of specials, and all other materials except pipe, per main work orders 1905 to 1912. The company also reserves the right to

present an exhibit containing four contracts, paving contracts, from each year covering data shown in exhibit "434".

1729 Whether in any of the contracts referred to in exhibit "434" the contractor got the dirt, or whether the dirt was retained as the property of the City,—I found no record of any contractor getting any earth in any of these contracts. I have no information to the effect that where the contract does not reserve the dirt the contractor gets it, I didn't read all the contracts, I read some of them, and had extracts made from them right along down through and I didn't find anything of the kind. There was a provision in the specifications about the earth being place- where the City requires, that is all I remember about the dirt, and a provision about the length of haul and over-haul. There is nothing in the contract that I saw or read that provided that the contractor had any right to the dirt whatever, he is required to place it where the City requires, within certain limits. Whether the City or the contractor got the dirt would make a difference in the cost of grading, and in the cost of the whole job perhaps, if the contractor could get a market for the earth, he might or might not have a market for it if he was entitled to.

Mr. Strode: The plaintiff reserves the right to present a tabulation on the subject within grading districts, covering the subject matter shown in exhibit "435".

My exhibit "436" refers to the labor cost in sewer construction in Lincoln, that is the scale, it is not a contract at all; it is simply an analysis of the City scale that was furnished me by the City Engineer's Office and I simply reduced it to price per cubic foot. I think that tabulation was prepared within a week or so, very recently. I have some data here on Sewer districts, as to how long I have had it, I have had that data in process of work,—it has required a great deal of work to work that up,—that has been in process of work since I was here the time before this; I think I got the final completion of the data when I was here the time before this, several months ago.

1730 That does not cover both sanitary and storm water sewers, only the sanitary eight inch pipe sewers is all that is included, This is all contract work that is covered by my exhibits, and I have dealt with the contract price, where the contract is let for the completed sewer, and is let as a whole then, at so much for the completed sewer. The depth to which the sewer is to be placed varies in different districts under different contracts, it is fixed by a drawing called a "profile" prepared by the City Engineer in connection with the specifications. You can get the average depth in any contract by referring to this "profile", and determine from that what the depth of that sewer was in that particular district. The City Engineers Office as far as I know, made no attempt to determine the labor items entering into the construction of that sewer for trenching. The only way I can determine that separate from the other parts is by estimate, I can make a fair estimate. I could

not have made just as good an estimate if I hadn't seen that. As to how the completed sanitary sewer aids me in estimating the cost of the labor for trenching,—I say it gives me the depth of the trench and the size of the pipe, and the price of doing the whole job is the only purpose I had in using the contract. The price of the whole job wouldn't tell me how much the trenching would cost,—that was the only purpose of the computation, to estimate from the contract price in each instance how much was paid for the trenching and back-filling alone. If there isn't anything in the contract to indicate how much was paid for that item you could not determine it from the records of the City Engineer's office or from the contracts except as a matter of estimate; it is purely a matter of estimate. Even if I knew what the price of labor was and knew the width and depth of the ditch I could not estimate it just as well from that as I could from the "profile"; I can take the Lincoln scale and tell what will have to be paid for labor
1731 on that date, but what I am estimating is what the contractor gets out of the proposition for digging that ditch, including his profit, if he made any profit. I did not talk to the contractor or any of them that did this work to ascertain their experience in the work, or what it cost them, I was around one or two streets and saw the work going on, aside from that and the information I got from the City Engineer's Office general information about the matter, I confined my investigations to what is shown on the face of the contracts.

Mr. Strode: The plaintiff reserves the right to offer an exhibit on the cost of the sewer construction corresponding to the subject-matter of exhibit "436", and also including storm water and sanitary sewers.

(Witness continuing:) I don't remember that I noticed in that record that the water mains for fire service were carried separate.

Asked to refer to my data and if I find that they were separate, then asked if the item of hydrants would be of any importance in my testimony in respect to that,—that the fire service would take care of that,—I would say that there were hydrants in this stuff that we took, I am very sure of that; but as to the fire service taking care of the hydrants I say not at all; fire service is not a hydrant proposition, it is separate; hydrants are connected with the regular mains, you run the fire service to the buildings to take care of the buildings. I did not understand that the joining materials for the distribution system of this plant *was* principally lead, I understood that it was mixed lead and cement on the company's cast-iron mains. I didn't have the information that up until 1900 and 1902 it was all lead; I simply assumed that it was mixed lead and cement in an undetermined proportion.

I referred to the miles of alleys in this town as 27.06 miles
1732 of alleys and 4.81 miles of alleys are paved; the 27.06 miles of alleys run parallel with paved streets, and adjacent to paved streets, that is, within half a block at least of a paved street. If the pavement wasn't on a street on both sides of the alley you

still might get a benefit from the fact that there was a paved street on one side under my scheme of putting the mains in the alley; if you decided or would like to run mains in alleys you would have an opportunity to get out of your paved street into an alley that was half a block away, if you thought an alley was a good place to run a main in. I haven't investigated to learn that upon paved streets here where the alley is not paved that the alley is not brought to grade, and I haven't based my computation on that.

Asked whether if the street was graded in front that it would be brought down to a lower level than it was before, that the natural surface grade wouldn't be the street grade when the alley was paved,—to that I would say it might likely not be, it might be a little lower. I would think on an average you would have to sink your mains a little deeper in the alley than you would in the street. Whether you would have to cross a paved street in order to get on the alley in the next block; you would have to cross a street every time that there is paving in the street, you have to cross underneath the paving.

There are more than two pages in the book of minutes of the company I referred to that are missing, there was a large number. I attach some importance to the fact that those pages are missing. The period covered or involved in those missing minutes, as I remember, was prior to the time the company removed its plant to the new location. The pages lacking in the corporate minutes are 55 to 66 inclusive, and 71 to 74 inclusive. Being asked what years are covered by that,—the first entry is the meeting of the Board of
1733 Directors June 12, 1876, page 54 of the original book of Minutes. My next entry in my copy is July 22, 1878 page 68 of the original minutes. That book was in a mutilated form when it was submitted to me. It was a rather small book I couldn't tell just how large it was; it was not a minute book, it might have been six inches by eight inches, or seven inches by eight. The binding of the book was considerably broken. I have forgotten whether any part of the binding was missing or not. Whether there wasn't any binding on it at all,—I would say I guess that is right, I guess the binding was gone. Whether the leaves were loose and it was wrapped or tied together,—I would say the leaves were not, as I remember, loose generally, there might have been a loose leaf some where in it.

Witness excused.

1734 Mr. W. J. ASSENMACHER, being first duly sworn, testified on behalf of the defendant as follows: Pages 2120 to 2239 original record.

Direct examination by Mr. Foster:

I live in Lincoln and am engaged in the general contracting and building business, and have been for the last seven years.. Prior to that time I was foreman for contractors for six or eight years. Before that I learned the carpenter trade for six or eight years. All of my work for the past seven or eight years has been contract work

on larger buildings, such as school houses, churches and public buildings. My principal contracts during the past seven or eight years have been:

| | |
|---|---|
| The Kearney County Court House at Minden | $80,000. |
| Lincoln Hotel Annex | 85,000. |
| 3 Buildings at the State Fair Grounds | 140,000. |
| 2 Buildings at the Peru Normal School | 80,000. |
| 1 Building for Charron Normal School | 40,000. |
| 1 Building for Judge Munger at 12th & P St | 18,000. |
| Church at Havelock | 20,000. |
| School at Fullerton, Nebraska | 30,000. |
| Church at Fullerton, Nebraska | 18,000. |
| 3 Schools in Lincoln | 45,000. |
| Church at Aurora, Nebraska | 18,000. |
| Law Building University Campus | 65,000. |

One of the buildings at the State Fair Grounds and three of the School Houses were built this year. The building at the University was built last year. The Kearney County Court House and the law building were of steel and concrete construction. I have made an examination of the buildings built by the Lincoln Gas & Electric Light Company located on block 79 and those at 33rd and X street in Northeast Lincoln. I measured them up quite thoroughly, and figured up what they would cost if built new to-day. Exhibit 169 is a summary and the figures opposite each building is the repro-
1735 duction cost of the Stable, Blacksmith Shop, $907.50, Generator House, $3,308.50, Booster House, 33rd Street, $471.25, Purifying House, $12,482.95, Meter Shop and Booster House, $2,589.63, Retort House, $6,080.00, Coal shed, $1,892.00, Oil Tank House, $1,276.66, Total $29,008.49. That is what I would replace the buildings new. Exhibit "170" is my estimate of the stable and blacksmith shop, as follows:

| | |
|---|---|
| Stable 18′ x 24′—11 high, shed on side 6′ to 10′ high 24′ long 14′ wide, shed on other side 6′ to 10′ high, 49′ long all paper roof, 10,000 feet lumber $28.00 | $280.00 |
| There is a few stone in the foundation estimated | 10.00 |
| Hardware and nails | 50.00 |
| Carpenter work | 125.00 |
| Rubber roofing, 17 squares at $3 | 51.00 |
| Painting | 30.00 |
| And wagon shop 18′ x 18′—10 to 9′ flat roof Blacksmith shop 18′ x 18′—10 gable 6′ high | ..... |
| 1 brick flue | 10.00 |
| 5,000 sq. ft. lumber at $28.00 | 140.00 |
| Carpenter work | 80.00 |
| Shingles 5,000 at $3.50 | 17.50 |
| Rubber roofing 4 square at $3.50 | 14.00 |
| Hardware and nails | 25.00 |
| Incidentals and per cent | 75.00 |
| Total | $907.50 |

It includes the wagon shop. The $28.00 opposite 10,000 feet of lumber represents the cost per thousand of the lumber on the ground. This will produce a brand new building. The wagon shop and blacksmith shop are fairly good buildings, but the stable is a sort of patch work proposition, a very poor building. This would include a profit, and I would take a contract at this price, and would expect to make a profit on it at this time. Exhibit "171" is a detail of the construction of the generator house, as follows:

| | |
|---|---|
| Excav-ing 200 yards at 40¢ | $80.00 |
| Concrete footings 12 yards at $7.50 | 90.00 |
| Brick and hollow title 80M at $15.00 | 1,200.00 |
| 1736 | |
| Cement floor 1,500 sq. ft. at 12¢ | $180.00 |
| Steel trusses | 250.00 |
| Galvanized iron roof 20 Squ'r's at $10.00 | 200.00 |
| 28 openings at $10.00 an opening | 280.00 |
| Roof on annex 5 squares | 22.50 |
| That means roofing, that means covering it over. | |
| 1,000 feet lumber at $28.00 | 28.00 |
| Carpenter work and openings | 200.00 |
| That is the carpenter work on the lumber. | |
| 7 foot porch on side elevator | ..... |
| Enclosure and run to coal shed, 5,000 feet | 168.00 |
| Carpenter work | 60.00 |
| Incidentals and per cent | 400.00 |
| Painting | 100.00 |
| Hardware and nails | 50.00 |
| Total | $3,308.50 |

In the matter of excavating I have included the grading. There would be no dirt to haul away. Exhibit "172" is the detail of my figures on the cost of replacement of the Booster House, located on 33rd Street, as follows:

| | |
|---|---|
| Brick work 14 M at $15.00 | $210.00 |
| Foundation 7 yds. concrete at $7.50 | 52.50 |
| 5 openings | 50.00 |
| Gravel roof 3½ squares at $4.50 | 15.75 |
| Lumber 1,500 ft. at $28.00 | 42.00 |
| Excavating 40 Yds. at 40¢ | 16.00 |
| Carpenter work | 35.00 |
| Incidentals and per cent | 50.00 |
| Total | $471.25 |

The "percent" is a contractors' profit and incidentals.

Exhibit "173" is a statement of the detail of my estimate for reproducing the purifying house, as follows:

1737

| | |
|---|---|
| 9,660 cu. ft. stone foundation 16⅔ cu. ft. to perch at $3.00. | $1,774.50 |
| Footings under columns 26 yds. at $7.50 | 195.00 |
| 6,000 sq. ft. cement floor at 12¢ | 720.00 |
| 222 M common brick at $15.00 | 3,330.00 |
| 2 brick piers 10 ft. x 2 ft. by 11 ft. high, 9,240 brick at $15.00 | 138.60 |
| 1 brick pier 7 ft. x 3½ ft. x 11 ft. 5,670 brick at $15.00. | 85.05 |
| 1 brick pier 10 ft. x 4 ft. high, 9,240 brick at $15.00 | 138.60 |
| 50 openings at $10.00 per opening | 500.00 |
| 12,500 sq. ft. lumber first floor at $30.00 | 375.00 |
| 24,000 sq. ft. lumber roof trusses, at $30.00 | 720.00 |
| Carpenter work at $12.50 per M lumber | 456.20 |
| Carpenter work setting 50 openings | 256.00 |
| Galvanized iron roof, 80 squares at $10.00 | 800.00 |
| Excavating and grading 1,000 yds. at 40¢ | 400.00 |
| Painting interior wall and exterior wood | 500.00 |
| Hardware and nails | 200.00 |
| Bond and insruance | 200.00 |
| Incidentals and contractors per cent | 1,700.00 |
| Total | $12,482.95 |

The building is 176 feet x 36 ft. 6 in. and 18 ft. high with 13 inch brick and stone walls; one cross partition basement to roof, and two cross partitions first floor to roof, with gables 12 feet high. I would take a contract to reproduce this building for the figure shown in the exhibit. Exhibit "174" is a statement of the detail in making up my statement of the reproduction cost of the meter shop and booster house:

The booster house is 15 ft. 8 in. by 22 ft. 6 in. by 14 ft. high.

| | |
|---|---|
| Excavating 85 yards at 40¢ | $34.00 |
| Concrete footings 5 yds. at $7.50 | 37.50 |
| Brick 20,000 at $15.00 | 300.00 |

1738

| | |
|---|---|
| Lumber for floor and roof 2,500 ft. at $28.00 | $70.00 |
| Gravel roof 3½ squares at $4.50 | 15.75 |
| Painting | 50.00 |
| 5 openings | 50.00 |
| Carpenter work $10.00 per M | 25.00 |
| Carpenter work placing windows and doors | 50.00 |
| Old booster house 14 ft. 3 in. by 11 ft. 4 in. shingle roof | ..... |
| Excavating 50 yards at 40¢ | 20.00 |
| Brick work 11,000 at $15.00 | 165 00 |
| Lumber for roof and stairs and shingles | 50.00 |
| Carpenter work and painting | 50.00 |
| Motor shed 9 ft. by 14 ft. 3 sides 8 ft. high | ..... |
| Lumber for roof and sides 1,000 ft | 28.00 |

| | |
|---|---|
| Paper roof and carpenter work | 50.00 |
| Meter shop 42 ft. by 22 ft. 9 in. by 14 ft. high | ..... |
| Excavating 100 yds. at 40@ | 40.00 |
| Concrete footings 15 cu. yds. at $7.50 | 112.50 |
| Brick 36,000 at $15.00 | 540.00 |
| Cement floor 924 ft. at 12¢ | 110.88 |
| Lumber roof and joists 3,000 | 84.00 |
| Carpenter work 3,000 feet at $10 | 30.00 |
| Carpenter work windows and doors | 40.00 |
| Gravel roof 10 squares at $4.50 | 45.00 |
| 14 openings at $8.00 | 112.00 |
| Hardware and nails | 100.00 |
| Painting | 50.00 |
| Incidentals and per cent | 300.00 |
| Total | $2,589.63 |

Exhibit "175" is my estimate of the detail and reproduction cost of the retort house, as follows:

1739 The retort house is 70 ft. 6 in. by 34 ft. with brick on 3 sides:

| | |
|---|---|
| Excavating 500 yards at 40¢ | $200.00 |
| Stone wall 1,645 cu. ft | 302.10 |
| Brick 70 M at $15.00 | 1,050.00 |
| 9 steel trusses at $40.00 | 360.00 |
| Galvanized iron roof 30 squares at $4.50 | 300.00 |
| Other building 33 ft. by 48 ft. by 26 ft. high, Excavating 500 yards at 40¢ | 200.00 |
| Stone walls 3,500 cu. ft | 642.90 |
| Brick 95,000 at $15 | 1,425.00 |
| 3 steel trusses and hips | 300.00 |
| Galvanized iron roof 25 squares at $10.00 | 250.00 |
| Painting and hardware | 250.00 |
| Bond and insurance | 100.00 |
| Incidentals and per cent | 700.00 |
| Total | $6,080.00 |

Exhibit "176" is my estimate of the reproduction cost of the coal shed details:

The coal shed is 110 ft. by 23 ft. by 11 ft. high.

| | |
|---|---|
| Stone piers 1,200 cu. ft | $212.00 |
| 20,000 ft. lumber at $28.00 | 840.00 |
| Carpenter work 30 M. at $10.00 | 300.00 |
| 30 squares rubberoid at $3.00 | 90.00 |
| Nails and hardware | 100.00 |
| Painting | 50.00 |
| Incidentals and per cent | 300.00 |
| Total | $1,892.00 |

Exhibit "177" is my estimate of the reproduction cost of oil tank house, as follows:

The oil tank house is 35 ft. by 24 ft. by 12 ft. high with side of 17 inch wall.

| | |
|---|---|
| Excavating 45 yards at 50¢ | $22.50 |
| 1740 | |
| Brick 4600- at $15.00 | $690.00 |
| Cement floor in bottom 118 ft | 14.16 |
| Steel trusses under roof | 150.00 |
| Lumber and shingles | 100.00 |
| Carpenter work and paint | 150.00 |
| Incidentals and per cent | 150.00 |
| Total | $1,276.66 |

My estimates at 50¢ per yard for excavating includes back filling.

Exhibit 178 is my estimate of the cost of brick work for 1000 laid up, as follows:

| | |
|---|---|
| Common brick laid down there at $7.00 per M | $7.00 |
| Brick mason at 70¢ per hour | 3.50 |
| Mortar mixer at 35¢ per hour | .70 |
| Labor, 25¢ per hour | 1.25 |
| Expense of what there would be wear and tear | .50 |
| And lime for mortar | 1.25 |
| Sand | .65 |
| Total | $14.85 |

In making my estimate on all of these buildings I used $15.00 as a unit on the brick work. That includes anything on these buildings. In figuring the carpenter work I used $10.00 a thousand and on the stone work $3.00 a perch, which is for the material and labor all in place.

(P. 2135.)

Exhibits 169-170-171-172-173-174-175-176-177, and 178, offered and received in evidence.

Cross-examination by Mr. Strode:

I figured all of the lumber at $28 a thousand except in one place where I have it at $30 per thousand. There is a difference in the character of the structure which enters into the cost of the lumber. The difference is in the use of heavy lumber and also materials. I figured on putting in good building lumber such as we use right along. I figured that it would cost $12.50 per thousand feet to put the lumber in place. I figured that the brick would be $7 per thousand and $7.85 to put it in place. This is on kiln count. The de-

tails for my materials I took right off the buildings. For the
1741 excavations I figured up the buildings. My younger brother assisted me. He held the tape line and I made the measurements and made a record of them and I have the original here. I, have no drawings of these buildings. My record does not agree with the gas company's on the size of these buildings. I went at the measurement of this carefully. I was down there three different times and put in about eight hours altogether. I have not included in my estimates any wiring. I was asked to include the buildings proper and I wasn't to take any measurements of machinery or anything in the line of machinery, and my estimate doesn't show any wiring. I have never seen the gas company's inventory. On the mortar my prices will stand for both natural cement and lime. It won't stand for Portland cement. The stable is not a very large building. I have it at $907.50 as a new building. It is the cheapest building down there. I don't vouch for Mr. Lea's figures. I have it more than his. I have the stable 18x24x11 ft. and then a shed on one side, 18 feet at the gable and 24 feet long. There is more than 3 inches difference on the stable any place you want to take it. The size would have something to do with the cost. On Exhibit 7, Mr. Brodnax shows the stable 18 ft. 3 inches wide by 36 feet, 3 inches long, and 10 ft. high. The building, 6x11 ft., must be the blacksmith shop or a shed. It is built in different sections. I do not get as many parts to the stable and blacksmith shop as Mr. Brodnax does. I get the part 24 ft.x18 ft., and the shed 6x24x14 ft. Then I took another part, 49x6x10 ft. I made it into three sections. I did not count the stone. I made the estimate I knew I could put the building in place for. I did not take the quantities because there are but a few stone in the foundation. I allowed for building a building. I could duplicate the stone easily for $10. The rubber roofing I have in square feet which I computed by the size of the roof. I figured whatever the covering of the building was. The
gas company has tar felt. I figured on better roofing. Rub-
1742 ber roofing is the same thing as tar felt, I guess. It is supposed to be for the roof of the building. I figured on 17 squares and the gas company, on 22.64 squares. I have two items of roofing but we don't divide our building in the same way and you can hardly figure that up that way. I am satisfied that I have plenty of roofing. I returned the generator house at $3,308.50. I don't know whether I was here when the generator house was built or not. I figured all of the brick as brick walls. I took into account the tile and figured them as brick measurement. You can buy them a little cheaper than brick. You take tile which is 4x5x9 and it will measure a little over two brick. I figured brick 2¼ to 2⅜x8x4. That is the average brick. In building buildings I don't have any contingencies. I didn't figure anything in on that. I figured up what the materials in the wall and the building would amount to before it was built, and I do not add any per cent on this amount to cover the items of contingencies. I add my incidental expenses as I have shown you and the per cent on the contract. That is all I figured. I don't figure on anything not coming out just as planned because

if you do you lose the job. My estimate, $14.85 per thousand brick in place, would cover the brick broken by the mason. There is a little waste, some broken materials, mis-fits, and poor workmanship. I don't add any per cent for these conditions. If there is any loss I take it out of my profit. I generally add 10% to the cost price for my profit which covers everything over-head. I would expect the plans and specifications for those buildings to be furnished before I entered on the work. I have known architects to add as low as 1% and as high as 5 or 6% for their work. State work here is generally taken at 2½% for superintendence, and planning. That seems to be the amount and they seem to be awful anxious to get the work for that, and I think it a fair price. I would have to add that item of expense to these prices if I wanted an architect. In
1743 addition there is liability insurance. I don't carry any liability insurance. I don't consider that a part of the profit. If a fellow wanted to add it to his own expense he could do so. You can seldom insure against wind storms until you are pretty well enclosed and then you insure your building any way. To meet this insurance during construction they give you a slip with your policy that holds it good until the building is finished. I would not take any contract for the next five years at these prices because I wouldn't know what the material and stuff would be worth, but I could have built those buildings at any time during the last five years for these prices. I know Perry Hahn, the man who built these buildings, and he is a substantial man. If he gave me his price it would not influence my estimate. If he bought brick at $7.50 it would not influence my estimate within the last five years. I don't know whether I could buy brick cheaper than he did during the last five years or not. He didn't pay that much for the tile. I figured the tile and brick the same price. There are a few more tile than brick in the generator house. I never paid that much for the last five years on brick. It costs about 25c. a thousand to get them off the cars to the place, which would make the brick, $7.25 when they reached the side of the building. I figure handling them right off the car. That short distance you can handle brick without two or three different handlings. I think a person could handle them as fast as he wanted them. He would simply have to unload them from the car as he needed the brick and hold the car there. I have handled a pile of material in the last five or six years and I have never paid any tract service. I didn't figure that the company would have to use the track every day. I figured each building separately and would take any separate one and put it up for the price I have fixed. In the purifying house I figure 13-inch walls and 17-inch piling. I measured the walls at several different places, at the doors, on the south side as I went in. The stone wall is a little heavier
1744 underneath. I notice in the plat, Exhibit 7, that there are three 13-inch cross walls there. I notice the plat shows some 17-inch walls but that is not correct. The two end walls are not 17-inch walls but the pilasters are 17-inch. The blue print shows the pilaster thickness but does not show the thickness of the walls all through. The stone wall down below may be 17 or 18 inches

thick. I put in 9960 cubic feet of stone wall. I had 1000 yards of excavation in the purifying house. The outside wall of the purifying house is 176 ft.x36 ft., 6 inchesx18 ft. high, which would be 6432 square feet. I did remember what depth of foundation I figured; I had them in mind at the time and whether or not I marked it down I can't tell. The depth is the whole thing. It seems to me that the cellar is about 4 feet deep, but I don't know just what I figured it at at that time. I must have figured about 4 ft., 3 inches to get my thousand yards. The diagram in Exhibit 7 shows 14 ft. from the bottom floor to the bottom of the basement but I don't agree with that 14 ft. I have 6 ft. on my list. I have 10 ft., 6 inches high on that 14 ft. that you have. The diagram of the building shows the excavation to be 9 ft. from the top of the ground to the bottom, but that isn't according to my figures. Assuming that this cellar is 9 ft. deep there would be 2000 yards of excavation. I can dig straight down on a cellar 9 ft. deep on the average ground. On the University Law building I dug 10 ft., 6 inches deep and allowed 6 inches on the outside walls for lining the walls up. I never excavate down in Salt Creek valley. Malone does a good deal of excavation here, also R. L. Young, and a man by the name of Mathews. I don't know who did the excavating down at the gas plant. I think I know the character of that ground down there; I see quite a little digging down there. Even if Mr. Malone did do the digging down there I don't believe he can tell you any more about it than I can. If he did the work he would learn something about the character of the excavation and I suppose he would know
1745 something about what it would be fairly and reasonably worth. Even if he said he would not take the excavating job down there for less than $1 a cubic yard I will do it for less. I know I have made a liberal allowance of dirt for excavating. By digging 4 ft. I would have the basement 4 ft. deep. I did not on these figures go outside of 6 inches for the walls. I will get the excavation just as it is. The foundation stone is the stone in that building up to a point where the brick wall begins. It is 10 ft. 6 inches high. The gas company in its inventory shows that stone wall to be 14 ft. In getting that I took into consideration that the stone is about 8 inches deeper than the floor. If it is 14 ft. deep it would make a difference in the amount of stone I had here. The heavy lumber that I have figured here on the roof is enough to take care of the steel in that roof. There is not very much there. I am willing to construct it at that price. I did not make a separate allowance for the steel. Whatever steel there is there it would cost money to buy it. I can't tell how many pounds of steel there are there. The wood frames and the wood covering is carried as one item. There is some corrugated iron on that roof and I ascertained that by measuring the roof. I have 80 squares and each square is 100 ft. On that roof the gable is 10 ft. high from the level of the eaves, and 10 ft. on the rise of 18 ft., 3 inches on the level gives you 20 ft., 6 inches high on the rafters. That would make 41 ft. and 1 foot on each side for cornices or projections would make 43 ft. and 43 ft. times 179 ft. which would be the length of that projection on

both ends, that will give you 80 squares which will cover that roof. It is 76 squares and 96 ft. or 77 squares. I observed the *luovere* on this building and the three extra squares will cover that. I have the wood in the floor in one item and wood in the roof in another item. I did not find any steel in the floor. The steel that carries the tanks is part of the equipment. I have not figured any cast iron in the floors. The lumber for the stairway is carried in
1746 the square feet of the floor. The exhibit does not show that but I figured on so many square feet of lumber. I did not figure any gutters on this building. I did not figure any spouts. I do not say that there — no spouts, there might be a little piece on one corner. I did not figure on any plastering. There is a little but it don't amount to much. It seems there was a little in one corner of the building. I did not figure on any electric wiring of the building. I think I saw a few lights hanging there but I didn't take them into consideration. The first time I was down I went over the barns and got over the generator house and I went to the purifying house and the man there told me I had better go and ask permission. I was there about eight hours. I had no plans of the buildings, nor any blue prints or specifications. I just had the buildings before me. I could take the items from the architect's plans on these buildings in about half the time I took them off the buildings. I just took the items here and then figured it out. I figured on adding $1,700 to the contract price for incidentals and profits. I tried to use about the same per cent on every building. It is a little larger on this larger building and on some of the smaller ones. You take some of these little items, rods in the trusses and a few of those things, I don't claim that I got the exact amount of that in each building but being there I thought to be safe and made my per cent a little larger my object being to tell you what I could put the building up for by looking it over. I think I charged the same per cent that I did for small ones. On this particular building it is 15% because the items of steel in the trusses and a few of those things that I couldn't itemize. I made it high because I did not want to get caught figuring it too cheap. My idea is to figure in profit and incidentals at about 12%. You could call them contingencies if you wanted to. The money would cost from six to seven per
1747 cent but a man wouldn't need all of the money. If I started that building I would have to allow for $12,000 at 6%. 85% of what I had would be paid to the contractor every three weeks. I would have invested about $4,000 at the start, later on not so much. It would only last for a week or two. After the investment it would not take more than a third all the time. If you owed for materials you would have to make the party who sold it carry you. He would have that much more while carrying them. I have had no trouble since they have always carried me. They would sell me as cheap on time as for cash. I have no trouble in that way, and get my material as cheaply as any one. I have to pay interest though. Then I would have to pay the architect 3% for construction. There might be one building down there that the architect made the plans for but I do not believe there were ever any plans

for the balance. The Law building at the University is a three-story building, and I built Judge Munger's which is two stories, and Florie Moore's building at 15th and O streets. And I built the Lincoln Hotel Annex. I had the biggest part of it. My first work here was fixing up the city hall. I bid on the First National Bank and the Bankers Life building, and the building here. I did not bid on the Winnett job. Excavating for the purifying house I think would just about hit the water line. If you would hit water it would make a difference in the cost of excavating. You would have to take care of it. On the generator house I have 200 yards of excavating. It is filled in on the back side. I had to figure that ground. On one side the hole comes out level with the ground. I suppose it is two or three feet deep round the back side. I have concrete in the footing and for the wall that comes up round the building. I have the building in two parts. One part is 40 ft.x30 ft. and I can give you the other part. I just took those items when I had them in mind in figuring them up. I did the figuring at my house. I had it marked down but I can't see it on my list. According to the gas company's measurement of that building I get
1748 32 yards of wall which is more than I got. According to those measurements it is 410 ft. round the building. I have given you 12 yards of concrete for that 410 ft. of wall. I figured the concrete 2 ft., 1 inch wide under this wall and 10 inches to 1 foot deep, and those measurements give 32 cubic yards of concrete. I can't tell you what basis I figured 12 cubic yards on. I can't find my measurements on that building here but I could tell you if I could find them. I have it some place because I knew it at the time. I didn't figure that wall at 410 feet long. I must have figured about 215 ft. of wall to get 12 cubic yards. There are no figures that would justify the 12 cubic yards in that wall unless the building is smaller than the gas company's figures. I figured it. I didn't guess at it. I did not figure any concrete under the little shed because there isn't any under it. I just took the portion of the building where the concrete was and by taking the gas company's figures of 410 ft. of wall that is what — there. I figured 6 inches of projection on the side of the wall. It is evident I will have to look up my figures before I will know anything about it. If the concrete foundation is three feet wide and three and a half feet deep, I will concede the concrete. I did not toss this concrete in at just $90. I can make mistakes. In the roof the only steel I figured was the steel trusses and the steel in the roof under that. I have got three trusses. I do not show the weight. I did not figure it in pounds. I just figured three steel trusses for the roof of the generator house, and channel irons. They went across the building. I suppose they would be 8 ft. high and cover the walls over 35 ft. wide. I have no details showing the amount and weight of the steel in those trusses. Steel is sold by the pound and the size of the truss would enter into the weight. You have to know how much they weigh in order to say how much it cost. I did not go into that detail. I figured
1749 what the trusses were worth and I took the number of trusses and steel and channels 4 inches and lumped it off. I took it

about so much a truss and so much a channel. I was able at that time to tell the size of those trusses but it isn't marked on here. I knew what the size of the building was. That might be the cause of my figures being off on the concrete because I didn't mark the size down complete. I think all the rest of the sizes are marked. I buy trusses of John Westover. I think he furnished these. What he was paid for them would be some evidence of what they were worth. The cost of this building has been furnished to me in detail as entered upon the books of the company. I put the trusses in at $250, and in doing that I used my best judgment.

Q. That building that you reported here to this court built for $3,308 is shown to you here in this exhibit "31" to have actually cost the gas company $4,551.51 with the details and every item entering into that cost set out there and you have here such a main difference and you don't make an itemized statement of them.

A. Of what?

Q. Such a man $1,100. in advance and you don't know whether he was working there? Do you think there was something crooked about that?

A. I don't know.

Q. I am asking you to assume that this is right, do you see any items that you haven't got in your report and haven't dreamed of that entered into the construction of that building?

A. Did you have a special meter for water used in that building $20? I put up the fair ground building, a $100,000 building and the water didn't cost me $20. on the building, you can't use $20 of water in that building.

Q. If the Water Department presented a bill for that amount and we paid it?

A. You undoubtedly used that water for other purposes.

1750 Q. Is there any other item in that?

A. It would take me a while to do that, I can't do it on a minute's notice; you can't make a statement that a fellow can't find items in. You mind that I can't make one that you can't find items in, you are finding them in mine and I am finding them in yours. You have here Nebraska Hardware miscellaneous $1.05, that is a small thing but it may or may not have gone into the building; I believe I could take you down to the building and show a lot of items that you can't show on the building.

On a window or door I figured $10 an opening. I did not have any down spouts or gutters or any plastering. I don't say that there is no plastering and it would cost something to put it on. I figured $400 for incidentals and profits on this building. It is about the same percentage that I figured on the other buildings and I made it come out in even dollars. If the building cost $3,000 it is worth about $400 for that per cent for anything of that kind. My figures amount to 15.7% on a contract of $12,482 for the purifying house and 13.7% on a building of about $3,300 for the generator house. If I had a set of plans that would show each building exactly as it would be built I would use exactly the same per cent where I could take a set of plans and go right at it, but here your ground

is of all shapes. One side of the building is high and another low and all these conditions are different and I have taken the conditions in that whole ant arrived at this per cent. I measured the retort house. I figured 70 ft. 6 in. x 34 ft. and I figured 500 yards for excavating. I think I figured the excavation 4 feet deep. That building was hard to figure because on one side you walk out on the level of the ground and on the other side you walk round it. It is something like the generator house. Yes, about 4 ft. 6 in. Yes, just about 5 feet deep. I haven't the depth marked here. You can't go down and tell how deep that cellar is if you are there a year.

1751 There is no building on one end and you walk out on the level of the ground and round here you go out on a slope and here it slopes. It might be 5 feet here and 2 feet there and here right on the level at the coal shed. To tell you the truth I wasn't trying to hold you down a cent on the job; I was trying to get an approximate figure. I do not show any wood in the walls and I don't think there is any there. The yardage included the amount of back filling. There are nine steel trusses in the roof of this building. I estimated their weight according to the length and figured about what they were worth. They are 34 ft. wide and I suppose 7 or 8 ft. high in the center. I think most of them are out of 1½ or 1¾ channel iron. I have not got the weight of that steel. I did not ask Mr. Westover what this steel cost. We can't assume that there are 14,523 pounds in the roof. The roof of the retort house is covered with galvanized iron. There might be half a square of tar felt there. I didn't find any concrete floor in the basement and if there is it isn't worth anything. I didn't figure anything. If there was any there I couldn't see it. I figured the doors the same as the windows, $10 an opening. I didn't figure any electric wiring and I don't believe there was any. The item of bond and insurance is to cover the bond on the building. I figured this item at $200 for the purifying house. I did not have any in the generator house as it was a small building, nor in the meter shop or booster house. That amount is about $4 a thousand on the building. It varies on different buildings. On every dollar that you pay a man you have got to pay insurance to protect yourself from liability during the employment of from two to three per cent. The per cent for incidentals on the retort house was $700. I measured the thickness of the walls of the oil tank house right by the entrance. The gas company had it at 18 inches and I have it at 17 inches. I have 45 yards of excavation. It is about 5 ft. out of the ground and about 5 ft. deep as near as I remember it. I haven't got the details of it marked here. I have the

1752 oil tank house 17-inch walls, two trusses, 10 rafters, 3x4, galvanized roof. I measured the inside for the excavation. I measured with a 6-foot rule. The thing is full of water and I stuck a 6-foot rule into it and as I got 12 feet I must have struck a hole with the rule. I would not be willing to accept the 10 feet until I looked it over again. According to the plat it is 9 feet to the top of the floor. According to the gas company's figures the building is 35 feet 3 inches by 24 feet, and 5 feet deep, according

to mine, which makes 155 cubic yards. My 45 yards of excavation with 10 to 12 feet depth is not due to an error on the part of the stenographer. I figured the excavation on the level of the ground that had been filled up. I used the original ground when they first threw the dirt out and the gas company threw it out against the side of the building and it is 4 feet higher on that side than on the other side. I don't know whether there is 5 feet of excavation or not. Dirt has been thrown up against that building for some cause or other. I think there was some excavation in putting that building down 10 feet in the ground. The roof sits right on the ground. There are steps 6 or 7 feet up to the door to get in from the outside. I believe 45 yards is all the ground taken out of that hole from the original level of the ground. I probably went down to a depth of 2 feet to get that 45 yards of excavation. It was filled round the building except about a foot and a half which might be a little low. I figured it on the level of the ground and not on the fill that you have thrown round it. I did not figure any separate amount for back filling. The 40¢ which I allowed for excavating covers that. I figured $150 for the steel in the roof. I don't know how many pounds. I have two trusses ½-inch and ½-inch angles. I do not know what they weigh, and didn't figure the weight. I figured the wood in the roof and also the corrugated iron by figuring shingles.

I do not know how I came to do it that way.

1753 I know there is corrugated iron in that roof and I don't think there are any shingles. There might be under the corrugated iron. There is sheeting on the first two inches. I figured 118 square feet of concrete floor in that building because it was holding water. I could see under the water that it was cement holders built to hold the tank on, and I took them out as near as I could check it and figured 118 square feet of floor between the cemented blocks holding those tanks up. There was a tank in there on top of concrete piers. That would take practically 840 feet. I figured only 118 square feet to cover the floor and the balance of it deducted on account of the piers. They are much larger than shown in the figure. I don't know, I thought they were larger. I figured this area round there but not in the concrete part at all. That has a piece in the bottom that comes up and I put my measure in and in one place I would hit high and in another low. I took out just the amount of concrete for the piers and I haven't taken out enough. What I figured I can't tell. I haven't got the figures by which I arrived at 118 feet. I made some once. I didn't figure anything under the tanks. I did not put any electric wiring in that building. I don't know whether there was any there or not. There was a door there but I put the carpenter work all in together. The usual $10 per will cover it. I didn't mention it in that way but put in $150 for carpenter work and cleaning. I don't remember about the window being there. I figured lumber and shingles but I hadn't ought to. This is the only building in which I carried the door or opening as a part of the carpenter work. I allowed $150 for incidentals and profit which would be about twelve or thirteen percent. On the meter shop and booster house I had one building 15 ft. 8

inches x 22 ft. 6 inches, and 14 ft. high. Another building was 14 ft. 3 inches x 11 ft. 4 inches with a shingle roof on it. Then a little shed on the side, 9 ft. x 14 ft. x 8 ft. high with three sides. Then I have another building, meter shop, 42 ft. x 22 ft. 9 inches, and 14 ft. high.

1754 The total excavation on these buildings is 235 yards. The excavation in the booster house does not cover the entire building; there is just a hole underneath the engine. I opened the trap door and looked under there. It seemed to me that that part was dug out after the building was built. I figured 85 yards of excavation on that. I do not have any figures as to the depth but I made some. I just figured it up on paper and checked it up over with my memorandum. I have the basement as 6 ft. deep according to my memoranda. Figuring 6 ft. of excavation I get 80 yards on the building which is 15 ft. 8 inches x 22 ft. 6 inches; the gas company has the depth as 9 ft. It it was 9 ft. the excavation would be 120 yards. I haven't any excavation here in the building which is 11 ft. 4 inches x 14 ft. 3 inches. I have no memoranda showing whether it was excavated, but I figured it just as I did this. I went down and figured it and I went down there and figured it again but didn't mark it on this place. I think it would be about 6 ft. deep but I don't think it is the full size of the building. I think it runs down on a slant to the top of the ground. I could tell just what the figure is for that. At that depth I get 36 yards. I must have figured a little deeper because I have 50 yards here. There is no basement under the building 22 ft. 9 inches x 42 ft. 3 inches. It has been excavated for a cement floor. I figured 100 yards. I am not able to tell whether there is a little basement under the clay building. I haven't got any data that shows how I got this yardage. On the meter shop, 42 ft. x 22 ft. 9 inches and 14 ft. high I have nothing in there about excavation. When you go around a building like that you won't make every item. You will make your mind as you see it and you will figure it but you will forget to mark those down, which you have in mind. I had to use my judgment. One place you go down like this and you come out on a level in another side, and another side you are up three or four feet high. You can't get it unless you make a plan of the building. Where there is a little dirt or a little place an engineer could go down and stake that off. I have given you all the excavation I have and the amount of it is

1755 216 cubic yards and I have reported it at 235 yards. If I were going down there I could give the exact amount of the excavation. You might find it a little deeper in one place than in another. I figured the price of 40c. for excavation would cover the back filling. I got the items on the building paper that is outside the walls and it would cost 30c. There are 10 squares of gravel roofing on the meter shop and booster house. Then there is a paper roof on the meter shop. That paper was figured and the side of that shop is covered with paper, and that was figured. That is all plain tar paper, as I have got it marked here. There are 3½ squares of gravel roofing on the 15 ft. 8 inches x 22 ft. building. I have also got a shingle roof which is in the item number 4 roofing tar and

shingles, $50. There is a concrete floor in the booster house or meter shop, 924 square feet. It is a 42 ft. x 22 ft. 9 inch building. There are no other concrete floors. There is a concrete footing in the booster house where the machine is standing but I didn't figure that. The diagram offered by the gas company here shows that there is a 10-inch concrete floor in the building that is 15 ft. 8 inches x 22 ft. 6 inches. I didn't figure it that way and I can't tell whether or not the concrete floor is there. If it is I didn't get it. I could find out by going out and looking. I think that floor is 4 inches thick. On the openings I allowed $10, for the openings, doors and windows. I don't know whether or not there were any down spouts or gutters on this building. There is a little ventilator I think, which is taken care of in this item of shingles, lumber, and carpenters. I did not find any plastering in this building or on it. I do not remember about a wood platform being used in front of the building. I did not take into account the electric wiring, and I did not pay any attention to the wrought iron pipe in the building. In my incidentals and per cent there is $300.

The coal shed I find is 110 ft. long, 23 ft. wide, and 11 ft. high. I measured that with a tape line from the outside. I do not
1756 think there is any excavation there. It seems to me there are piers built on the top of the ground. It is a frame building with stone and brick piers kind of mixed together—anything that they had that they could get a hold of. The piers look as though they sit right on top of the ground. There isn't any excavation down around the piers at all. I do not believe the excavation for those piers is 2 ft. deep. I don't know how long this building has been built but it is an old building. There was 12 cubic feet of stone in the foundation of that building. I determined that by taking the amount of piers and their size. I can't tell you what size they are. I think they are about 2 ft. square. I have 45 piers, 2 ft. x 1 ft. 6 inches. That is the stone, brick, and a little of everything. You wouldn't figure them either brick or stone walls because there is a brick and a stone here, and we would call it rubble stone work. Then there are 7 piers 6 ft. x 11 ft. 6 inches x 6 ft. high. One may be of brick, and another of brick-stone, and another of stone. I figured them as stone. I guess they ar-n't quite 6 ft. high. They are marked 6 ft. here but I can't tell you. I don't believe we dug down on everyone and measured it but I have here 6 ft. I used my judgment at the time I put it down. I can't recollect whether or not I used the 6 ft. in my figures. I haven't got my figures here that I figured on. I didn't keep the slip. We were checking right along on the other slips just as I checked on this paper this morning. I can figure it up in a short time. I figured the lumber in the walls of the building, the roof, and the floor, altogether and put them all in at 30,000 ft. The plank floor is 110 x 23, and 2 x 6 studs and 2 x 6 ceiling, which is held up by 2 x 6 rafters and 1 x 6 bridging, and one scale 4 ft. x 4 ft., and it is a platform of 2-inch plank, 7 ft. wide and one partition 2 x 6 studs, one-half built up. I figured up each of these items at the time just as I did on the piers. I also figured 30 squares

of rubberoid roofing at $3 a square, and I figured $300 inci-
1757 dentals and profit which is about 18% of the cost price. There wasn't any paint on this building and I figured paint and nails and hardware. I didn't see any paint in your estimate either, but I suppose it was painted sometime when the building was new, that is, the doors and openings. The oxide shed is 6 ft. x 14 ft. x 7 ft. with a plank and iron roof. I didn't put it in my exhibit because I saw that it was such a total wreck that I didn't figure it, and this was not included in my item of carpenter work. I figured the main part of the stable, the gable, 18 ft. wide, 24 ft. long, and 11 ft. high at the eaves, and there is a shed 6 ft. x 10 ft. x 24 ft. on the other side which filled out that side of the barn. The shed on the other side is a little uneven but I took the full length of the shed that it was from 6 ft. to 10 ft. high and 49 ft. long, all rubber roofing. I included all of the lumber in this barn in the walls of the roof and in the floor as one item and figured it as 15,000 ft. I put the doors and windows in at $10 each. There are some doors and windows there but they are made out of the same stuff as the floor. I did not allow $10 apiece for the openings but figured the carpenter labor was to do that work. I did not see any electric wires. There are a few stone in the foundation and I marked them at $10. I thought it would be equivalent to an opening. There are in the blacksmith shop some brick flue, and I have the total $907.50, and I have put in $75 for incidentals and profit, which would be about 9%. That would include looking after the construction of the building. The time put in for that would depend upon how many men you had and the number of men depends on how many men you could get. I figured on from five to eight men. I don't know as it makes much difference how many men you put on. It is hard to tell how many days it would take. I would hate to figure it approximately. I figured $10 a thousand for putting the lumber there. In that situa-
tion I can't tell how long it would take to build the barn. If
1758 I had a good foreman I might not go down to the building more than once. That is as near as I can get to it. On the booster house at the district holder there was nobody there to let me in and I had to look in through the windows. I got the measurements from the outside any way, and got the idea. On the excavation I could see the pit inside the cellar and I took into consideration the excavation around the walls. I figured 40 yards of excavation. I saw in one corner where a hole was dug and I estimated the size of that hole and the excavation for the walls. The hole was inside the building and I looked in through the window and saw the hole. I thought 40 yards would be all right for what I could see. I did not say that the gas company's figures were not absolutely correct. I did not figure any brick in the foundation. I had a footing under it and figured the brick in the walls. I estimated the concrete. I could not see it but I estimated $52.50 for the concrete. I would accept the gas company's figures if I could look them up. I did not have any back filling. I found 14,000 brick in the walls which are the ones I saw above ground, from the grade line up. The roof was tar felt and gravel. The floor was dirt, all that I could see. I

am unable to say whether that was concrete. There were five openings and windows there that I took count of. I did not take in any electric wiring. There were 1,500 ft. of lumber and I figure $42 on the ground and $35 extra for carpenter work, which included the hanging of the doors and putting in the windows. I also have $50 for incidentals and profit, which is about 12%. I think I figured five or six feet deep for the excavation. I suppose there would be some back filling. That has been filled up around there with cinders and with the digging of that other building, about 6 inches around the wall, and I figured the 40c a yard would do that.

Redirect examination by Mr. Foster:

In my opinion the $60 of water shown in Exhibit 31 for the construction of the generator house is $55 excessive. The
1759 water is used for mixing mortar, concrete, or anything that has to be mixed. They wet the brick occasionally, too. That would be something like 400,000 gallons. In figuring the quantities of dirt to be excavated I figured on the surface of the ground just as it is, so that any grades which may have arisen from making these excavations at the natural surface has not been allowed by me. My figures all contain the cost for excavating any fills that may have been made there. The excavation for the work done by Mr. Malone at the Fair Grounds was measured in the solid ground before it was taken out. He was permitted to take it out with scrapers and haul it 300 feet, which haul was included in the price of 25c per cubic yard. That was done in May of this year. I did excavating on the Salt Creek bottom for the Hayward school at 9th and Z streets about two months ago. I went down to the water line. The depth of that excavation was 8 ft. 6 in. I figured it at 40c. a yard and I sublet the work at 40c. His contract permitted him to dispose of the dirt. He had to haul it away from the premises. I let part of the back filling for 40c. and part of it for 35c. This was included in the 40c. price for excavating and I didn't lose anything on the work. I think the lay of the land and the character of the soil there and at the gas works is about the same, both being in the Salt Creek bottom. I did not encounter any difficulty in the laying of the footings there. The water was in the trenches but by putting in the concrete the water was raised out. The same conditions would be met in the construction of the gas building if they were extended down to the water line. But none of the buildings would require as deep an excavation as that at the Hayward school. Malone's work at the Fair Grounds for 25c. a yard varied in depth from about 4 ft. to 10 ft. 6 inches. It is more expensive to make a deep excavation. He dug straight down and did not make a slanting side. I didn't see the soil below the top of the ground at the booster house and I don't know whether there is any difference in the character of the soil there and the Fair Grounds or not. If the surface dirt at the booster house came out of the excava-
1760 tion it was of the same character as the excavation made by Mr. Malone at the Fair Grounds. In my estimate of the

area of the concrete floor of the tank house at the gas works I eliminated all of the floor space directly beneath the tanks. The purifying house is a pretty well built house, but I think the balance of the houses are in bad shape. The purifying house had plans drawn and was worked up as though someone had had charge of it. If there was a variation of 2½ inches in the walls of that building before I would say that the building had not been properly supervised, I would want to know what had caused the variation, whether it was done in building or by settling of some kind. I didn't figure any price for the steel in my computation. I estimated what I thought was about the weight of the trusses and figured about 3½ or 4c. I didn't weigh the steel and I didn't figure its exact weight. That is what we have to pay for steel. I buy it and use it in my construction work at 3¼ to 4c. A heavier piece will cost less to the pound than the light. I would say that 5c. a pound is too high. I can actually buy steel for 4c. His estimate is 20% too high. The two buildings at the Fair Grounds had quite a little steel of the class used here. There were lots of trusses. There I have just completed one and one I built three years ago. Most buildings I have built of a heavier steel construction like the Law building and the Minden court house. They are fire-proof and have heavier beams. I can estimate the weight of the steel exactly. If I have the time I can measure every piece of steel. It would take quite a little time to measure it, though. I have estimated the steel in this manner lots of times in my bids and have never asked for steel figures, if there is not too much steel in the job. There will be variations in my estimates. I might figure too many pounds in one place and not quite enough in another but I always figure to come out on the safe side. I figured on the gas company's buildings the same as if they had given me the plans and in doing the
1761 figuring I acted with some judgment.

Redirect examination continued by Mr. Morning:

I intend to go back to the gas works and look up the matters that Mr. Strode has asked about. While I am doing that I will look inside of the booster house on 33rd street.

Recross-examination by Mr. Strode:

The light fabricated steel costs more a pound. Some of the big 1½ angles might come up to 5c. a pound and the 4-inch channels would come down to 3c. I can't tell what it would cost everybody to put that steel in place. I think 1c. a pound would be too much. I believe ½c. a pound would do it. I don't know what the steel erectors figure. If 1c. a pound is the customary price for erecting steel of the kind that is involved here then Mr. Lea's figures are about right. I can put it up cheaper. I figured it could be set for 4c. I think it would be a good policy to slope the excavation for the district holder if it is 23 ft. deep. I think that is getting a little too deep. I excluded all of the area in the floor of the tank house with the exception of 118 ft. on account of the tanks and piers.

The tanks do not rest on the floor at all. They stand from five to seven feet above it. The foundation for the tanks are stone piers that sit under them and go to their own foundation. The floor under them is higher than the other place. The basement in the Hayward school is used for a furnace room. It does not extend throughout the building. There was water in the bottom of the excavation there, but it did not bother me in the construction work. I laid concrete right in it. There was blue clay there also. We were able to plow it and it wasn't very bad but we didn't use any scrapers. I don't doubt but what Mr. Malone lost money on the East Lincoln holder. He sublet it for less than 75c. a yard to J. D. Mathews. In Mr. Lea's report I do not think he allowed anything for water on the construction of the generator house. I don't see any water there. Mr. Lea's total is $3,739. The gas company's records show that that building cost them $4,551.51, which includes the
1762 item of water which I have criticised. My estimate of the cost of the building did not include anything for water service in the building. The meter costs ten or eleven dollars, and the water piping and faucets cost money. I think $30 would be too high unless you have a lot of pipe. I have built buildings that there was not $5 extra on. I built the Aurora Methodist Church building and it never cost a cent extra. I do not think that there is any profit in extras. I would rather build a building without any because you will have trouble with the owner quicker with extras than without them.

W. J. ASSENMACHER, recalled for further direct examination, testified on behalf of the defendant as follows, pages 2630 to 2656, original record:

Direct examination by Mr. Foster:

Exhibit 266 is an elevation of the purifying house—a four-side elevation. It was made under my direction and it is correct. Exhibit 266 offered and received in evidence.

It was prepared for the purpose of showing the amount of excavation taken from the purifying house, and also because of the fact that the last time I testified I was ordered to measure it up and see whether my guesses were right, and also in regard to the walls. We got the depths of the wall in the ground and the footings at the different points by digging down the side of the walls and had the city engineer give us the level around the entire building. This was done by Mr. Steckelberg and the figures on this exhibit were taken from Exhibit 265 prepared by Mr. Steckelberg. In my former testimony I said 1,000 yards was necessary for the excavation in the erection of this purifying house and now I find there was only 348 yards of natural soil taken from the ground in placing this building. That would reduce my figure for the excavating from $400 to $139.20. On the present surface of the ground the yardage is 1,456, excluding all of the cinders and brick. The stone wall elevation is 55.6 and the footing is 44.4, which leaves 11.2

ft. of wall in the ground. The stone wall runs from 20
1763 inches to 24 inches thick. It varies a little. The brick wall is practically all 12-inch wall, with the pilasters 17 inches thick. The north two-thirds of this wall is a little thicker because of the windows being made a little wider, but it is still a three-brick wall. They used to build the buildings with a hollow space. I don't know whether the 1½-inch difference is filled with cement or not, I can't tell. The former figures for the brick work on this building is sufficient to take care of the 17-inch pilasters and I don't care to make any change in my figures on the brick work. I measured the walls at three or four different places—four different places. I measured at those windows, two different places. It was practically 15 inches—14½ or 15 inches, this wall in here. You take the wall between—well, say the south wall north of the main building of the purifying house, and it is a 1.1-foot wall. The south end of the new building is all 13-inch except the pilasters. I know my measurements are correct. On the excavation for the actual yards of the natural soil I took the building 163 ft. x 37.3 feet. and added 1.4 ft. each way for working room for the workmen. The elevation of the natural soil as we dug down on this building we found to be 46.1 ft. and the top of the footing of the main north building was 45.1 ft. That is, the bottom of the excavation of the building proper. Now, that 45.1 taken from 46.1 leaves 1 ft. excavation under the building, which equals 6,124 cubic feet. The footing of the excavation around this building was 3.4 wide, excavated 8 inches thick, which I figured would be .7 and I figured 8 inches. That would be about 8½ inches and I took 163 times 2, which is both walls, and 37.3 times 2, which is the other walls, 3.4 ft., which is the depth of the excavation, times .7 feet., which is the thickness of the excavation, making 2,804 cubic feet, and adding that to 6,124 cubic feet equals 8,948 cubic feet, or 332 cubic yards. Now, the addition on the south of this building is 13 ft. 3 in. long x 37 ft. 3 in. wide. The elevation of the natural soil is 46.1 and the elevation of the bottom of the excavation is 46.1, which
1764 leaves no excavation under that part except the footings, which equal 13 ft. 3 in. twice, being both sides, and 37 ft. 3 in. and walls 31 ft. 4 in. times .7 equals 212 cubic feet or 8 yards. There are two different piers in the basement that I figured 8 yards, which makes 348 natural yards of soil taken from that building. The natural surface in Exhibit 266 is shown by the line of the natural soil, that long dash and dot between the lines and down under the footing. That is shown on all four elevations. The footings are shown with dotted lines. The elevation of the basement floor is shown by a dotted line and marked FL for floor elevation. That is shown on the east and west elevation. It don't show the others. The present grade is shown by the solid line with the elevation marked about every 50 feet. It shows on all four elevations. I was asked to ascertain whether or not there were any steel rods or trusses in the purifying house, but I don't believe I have got that stuff with me. The outside measurements of the stable are shown correctly on Exhibit 265, which are the company's

measurements. I was asked about the steel in the trusses in the roof of the retort house and I did not find any more steel there than I have accounted for in my figures. I do not care to make any changes. I did not find any tar felt on the retort house. There was a little box between the retort house and the purifying house which would be about $1.50. The basement of the oil tank house has a concrete floor. I did not have that in my first estimate. I had 118 ft. the other time, amounting to $14.16, and now I figure it 620 ft. at $74.40, which is to be added to my former figures. It would not make any difference in my bid if I was to enter into a contract to construct this building with the incidentals and per cent that I have at $150. I would still take the building at that price. The thickness of the wall in the oil tank house varies. It measures 17 inches in some places and 18 inches in others and the gables will measure a 13-inch wall. That does not make any difference in my former figures. There is a concrete floor in the booster house, being 304 ft. of concrete. I did not have any
1765 such item in my former figures and it makes a difference of $36.48. I have gone over my figures concerning the excavation under all of the buildings of the company and have found that some of them were a little more, others a little less, and that my former figures were more than what was actually taken in actual soil from the buildings, and I did not find as a general rule any reason for changing my former figures. Taking the buildings all through I didn't change anything. I got a little low in the oil tank house, but in the other buildings I was high enough to more than make up for it. In the purifying house there are 1¼-inch rods in the center of each truss, 10 feet long. That is from the top to the bottom of the truss and a cast cap on top, 2x6x8 inches, and there was also a plate of 6x8x¾ inches. There are nine of them. Then there were 18 rods 17 ft. long, and a cast cap, 2x6x8 inches; also a plate 6x8x¾ inches. Then there were 18 stirrips 3-inch material by 1½-inch high, and they are 18 inches long. That is all. I did not figure anything for these in my former testimony and it would make about $40 difference in my estimate.

Cross-examination by Mr. Strode:

The stone wall in the purifying house is 24 inches thick in some places and 20 inches in others. 20 inches is the thinnest place I found. It is in the north wall. The other walls will average about 23 inches. The floor sits right on the stone wall and the difference between the floor and the bottom of the basement would be about the same except as to the footings and it would be 9 ft. 4 inches from the ceiling of the floor to the floor below. The joists sit on the stone wall and it does not extend above them. The brick wall comes down and fits around the joists, and the top of the stone wall is the bottom of the joists, and the stone wall runs down to the floor below and below that floor. The entire height of the stone wall is 11.2 ft., which would be from the bottom of the foot-

ings to the top of the wall. I got that from the measurements
the city engineer gave me. It is 4.3 ft. from the top of
1766 the ground around the purifying house to the bottom of
the floor. That is the average. It does not vary over a foot.
It is 5.1 ft. between the bottom of the joists and the grade. If
the cellar was to be dug as the grade is now it would be 4.3 ft.
deep and the footings would be 6.1 ft. deep, which would be 1,456
cubic yards. I allowed an outside excavation of 8 inches for the
actual construction. They generally allow from 6 to 8 inches. I
did not check up the piping and wiring in the purifying house.
There is no basement under the generator house. The footings
are concrete. The footings in that foundation are 6 inches thick.
I measured it about the middle of the east wall. The cellar in the
south retort house is 3.9 ft. deep, and the north retort house, 6.8 ft.
deep. The south one is 76 ft. x 33 ft. 6 inches, and the north one
is 32 ft. 9 inches x 47 ft. 3 inches. There are nine steel trusses
in the retort house. I went over the whole steel and I found I was
right the other time. I don't want to change my testimony. The
steel trusses are not the same throughout the different buildings.
One building has one and the other building has another, only
to the hip. Exhibit 267 is the strut put in in the north retort house
between the hip trusses. It has a hip strut and a main strut put
in between. There are four hip trusses. A hip truss is the hip
of the roof to hold up the roof. Exhibit 268 are the trusses in the
south retort house, and Exhibit 269 are the trusses in the north
retort house. There are nine steel trusses in the south retort house,
which refers to Exhibit 268. There are four in Exhibit 267, and
two in Exhibit 269. I guess there is a cement floor, all right, in the
basement of the retort house, but I wouldn't call it that. In the
oil tank house some of the walls are 17 and some 18 and some 13
inches. The gables are 13 inches and the balance are 17 and 18
inches. They are the part above the square of the roof. It is 10.1
ft. from the top of the surface of the ground about the oil tank house
to the bottom of the basement. The dimensions are 35 ft.
1767 3 inches x 22 ft. 9 inches outside, and in addition to that
we allow 8 inches around for excavation. The yardage there
for the oil tank house would be 342 yards. There is a little steel
in the roof of that house. In my old estimate I have it as $150.
You didn't ask for the details of it. I testified before that they
were steps leading up to that building, but there are none. I will
admit I was wrong. There are 620 yards of concrete floor in this
oil tank house. I deducted the walls and footings under the ma-
chinery to get this area, and the piers that carried the tanks. There
is no basement under the meter shop. The footings are 4 ft. 10
inches. They are either concrete or cement. It shows the cement
on the outside. The booster house I got the excavation at 42 yards,
a depth of 6 ft. 6 inches from the present surface to the bottom of
the footings. I didn't dig down on the outside of the wall, but I
allowed 8 inches, I think. It is a small building, 15 ft.x12 ft.

1768 JAMES G. MATTHEWS, being first duly sworn, testified on behalf of the defendant as follows: Pages 2294 to 2309 original record.

Direct examination by Mr. Morning:

I live in Lincoln and am engaged in the excavating business. I did part of the excavating for the gas holder at 33rd and Vine streets for Mr. Malone. I dug the ten feet on the top part for 35c a yard and the dirt. I do not remember what the total amount was. I took the contract and he was to pay the expenses and if there was any left I was to get it and I received enough to pay me fair wages. After that portion of the contract was completed, I continued to work for him by the day as foreman on this job. There was something like 4,000 yards of dirt taken out altogether. When we dug the hole we dug down as straight as we could. There might have been a slant of about a foot. The dirt was taken out of the hole by scrapers. We had a slanting driveway into the hole, which was wide enough for two teams to pass and I performed my part of the contract by means of this driveway. The hole was 22½ or 23 feet deep, altogether, and what I got paid for was the dirt actually taken out of the hole and we did not count the dirt removed to construct the driveway.

Cross-examination by Mr. Strode:

I did not take the contract to do all the work because I was afraid of losing too much money. The second ten feet could not be removed at the same price as the first ten feet. I went as deep as I wanted to at 35c. The slope of the driveway for the first ten feet was not very much, but as we went down it had to be extended. When we got down pretty deep the dirt caved in on us and we had to clean that out. I did not keep any measurements of the amount of dirt removed and I have no particular way of finding out. I never figured it and I don't know that I could figure it. The other fellow suggested that 4,000 yards to me. I hauled lumber
1769 and telephone poles for about two days to brace the sides of this excabation. We had to build a wall inside to hold it from coming down on us. On the first ten feet we did not have to do that. I did not pay the bills and I do not know what the excavating cost. I would not have undertaken the excavating after the first ten feet for 40c a yard.

Redirect examination by Mr. Morning:

I was afraid to take the whole contract because I had never dug anything like that before, and I contracted to dig about the depth I usually went. I wouldn't try to dig the balance of that hole for 70c a yard. I might make money if I had real good luck and it didn't cave in. The walls caved in when we got down about 22 feet. I can't tell you how much dirt caved in or how much it cost to take it out. It came in off the East side, started about five or six feet back from the edge and sloped down about eight or nine feet.

In another place it fell in two or three feet wide clear down. That was where they were digging to put in gas pipes. We used the timbers all around the excavation. We left a cone in the center.

Recross examination by Mr. Strode:

Just as we got it finished a big rain came and filled the hole half full of water. The brick men had to pump this out, but we had to pump it out a couple of times before we had it finished. I do not know who it was that told me the yardage was about 4,000 yards.

1770 W. D. J. STECKELBERG, being first duly sworn, testified on behalf of the defendant as follows: Pages 2608 to 2630 original record.

Direct examination by Mr. Foster:

I live in Lincoln and am a civil engineer. For the past five years I have been the field engineer in the city engineer's office and I have been in the business for eleven years. On October 30, 1913 I took the elevations of the buildings and ground of the plaintiff company between Second and Third and L and M streets, Lincoln. The elevations which I took are shown on Exhibit 265 in yellow crayon. I placed them on this map. These elexations are made with reference to the city Datum Plane This Exhibit is a map of the gas plant location. Exhibit 265 is offered and received in evidence. It is a correct copy of the map that was furnished by the company. The elevations taken and shown on this Exhibit are the actual elevations of the ground about the buildings, the chart of the walls and the top of the footings of the walls, the water basin and the floor elevations and the natural elevations of the old soil out in the channel of the old creek bed. By the old soil I mean the elevation of the natural surface before it was filled in. I dug down to the old surface on the East side of the purifying house, South of the center North and South. The point is indicated by an arrow in yellow crayon pointing to the spot, and there is shown the elevation of the top of the soil as it is there now and also the old original surface. The words appearing there are, "Cut bank shows one foot natural soil above top of footing. Natural soil elevation equals 46.1." I also took the elevation of the natural soil off of the company's premises about due south of the gas holder, right adjacent to the filled ground and the elevation there is 45.3. It is marked slough elevation 45.3. The point is not over thirty feet north or south of where these words appear. I also took the elevation of the natural soil outside of the company's grounds at a point ten feet west and about 175 feet north of the purify-
1771 ing house. The elevation there was 43.9. That point is indicated on the map by an irregular line in yellow crayon marked "slough 43.9 feet." I also took the elevation of the basement floor at the north end of the purifying plant, which is 46.2, and the little room to the south and the floor elevation is 46.8. The retort house floor elevation is 46.9 and the north end of the floor

elevation of the retort house is 43.9. That is the lowest floor. The generator house floor is 45.6. The oil house floor is 40.4. The tank is 46 even. The natural surface of the ground to the point where this plant is located is very close to the grade, between the three points at which I took elevations outside of the company's premises.

Cross-examination by Mr. Strode:

The zero of the city Datum Plane is 1096 feet above sea level. The bench mark is on the city hall and we have another one at the state house and from these two bench marks we run all over the city. If we want to get the elevation above sea level we add 1096 feet plus to the elevation we get running from these bench marks. The elevation of the bench mark at the city hall is 1172 feet above sea level, which is 30.7 feet higher than the elevation of 45.3 at the plant. I can not give you exactly the elevation of the city hall bench mark, but it is 1172 and a fraction feet, and the point marked on the map as having an elevation of 45.3 is 1141.3 feet above sea level, and the point marked 43.9 on the map is 1139.3 feet above sea level. The distance between these two points is approximately 700 feet and the difference in elevation is 1.4 feet. These points are marked "slough" because water was standing there. Salt Creek runs northeast. It is a crooked stream. Its general trend is from the south to the north at this point and the valley slopes with the creek and is higher south and lower north. 43.9 1772 is north and 45.3 is south. These elevations are those at those particular points, and I do not pretend to show the elevations of the ground immediately surrounding. The other elevations around the plant are the elevations of the ground as it now is. Of course all buildings at the gas company's property were put up long before I came here as an engineer. I have been established in Lincoln for about fourteen years and I don't claim to possess any original knowledge about the conditions down at the gas property at the time the gas plant buildings were put up. The lots there have been filled in more or less, apparently as soon as the buildings were constructed. My supposition that the ground was filled in afterwards is based upon general observation. The ground is filled mostly with cinders. I can't tell whether these cinders came from the present plant or from the old plant. I would not care to state how much of the fill is of cinders and how much is of dirt. I dug down to the footings at the place where the elevations are shows as 44.4 and 45.1 and struck water in both instances. I have a seven foot fill of cinders and brick between the generator house and the 50,000 foot holder. I measured this from the outside. It is just filled in there between the walls of the two buildings. It is simply a pile of cinders. There are railroad tracks east of the plant. I am inclined to believe that the slough there is the result of the excavation by the railroad company to get dirt for their tracks. They would know. The track running into the gas company's property is on top of the present surface, and is above the old original sur-

face. The top of the grade has the appearance of cinders. I have made no profile.

Redirect examination by Mr. Foster:

The cinder fill between the generator house and the 50,000 foot holder has the appearance of being used as the surface of the ground. It is levelled off, except within about ten feet of the generator house. It appears to be part of the general plan of filling up the ground.

1773 HORACE S. WIGGINS, being first duly sworn, on oath testified on behalf of the defendant as follows: Page- 2034 to 2070, Original Record.

Direct examination by Mr. Foster:

The qualifications and competency of the witness as an accountant is admitted.

I have made an examination of the books and accounts of the Lincoln Gas and Electric Light Company so far as the construction accounts are concerned covering a period from 1873 to 1912, inclusive. Exhibit "157" is a list of the books examined by me so far as they relate to the construction account. Exhibit "158" is a summary of the totals of the gas construction account from 1873 to 1912, inclusive, showing in one column the amount charged each year and in a parallel column the total for the period ending that year. I secured the details for this Exhibit up to October 1st, 1900, from the printed records in this case in the United States Supreme Court. From that time up to the end of the account I have prepared Exhibits which will follow showing the various construction accounts each year. Exhibit "159" is a statement of corrections which I have found necessary to make in the printed record, where there were errors, omissions or duplications in the printed record. In making this Exhibit I have given the page of the printed record item that was erroneously reported omitted or duplicated, and in the one column shows the way the item reads in the printed record and in another column it is shown how it should read according to the books of the company, and I have shown in each instance whether it was an omission, addition or duplication. Exhibit "160" is a list in detail of the gas construction account for the year 1891, and comes from the printed record at page 526; it seems that there was one page of that record that was lost by the reporter. Those items amount to $18,356.65. It does not affect the total shown in the printed record, but only supplies the details omitted. Exhibit "161" is the construction account for the month of October, 1900, which was omitted from the printed record. It also shows an error of $1,089.87 in the total shown in the printed record of the
1774 construction account for the year 1900 in favor of the Gas Company. The error referred to appears on the construction account shown on page- 574 to 577 inclusive of the printed record. Exhibit 162 is a statement of the gas construction account for the

year 1901. This Exhibit shows the various pages of the ledger for these amounts, the title of the accounts with dates covered by each account to which the items are finally closed and to the ledger account at the close of the year 1901 construction; in the next column I have shown certain items that were carried forward from the year 1900, and were included in the final closing out of the accounts as 1901 construction. In the next column I have shown the correct amount for 1901. The total amount of the items that were carried forward from 1900 to 1901 and went to swell the total construction charges in 1901, which is $22,538.31, that is so far as the printed record is concerned. I do not want it understood as implying that the books of the company were erroneous to that extent. The account in the printed record is excessive to that extent as appears on page 577. I testified about this same statement in the record and made the same correction in my testimony in this case before. It never got into my totals, but it does appear in the totals of the Gas Company on page 577. Exhibit "163" shows the gas construction accounts segregated as shown by the Company's books from 1902 to 1912 inclusive. The figures for 1902 to 1906 inclusive agree with the account as shown in the printed record with the exception of 1902 I have about $450.00 more. Exhibit "164" consists of 37 sheets which is a detailed statement of items charged to gas construction, generally spoken of as "Works account" from 1901 to 1912 inclusive, as shown in detail and explained as far as I was able to find it on the books of the company. Every detail, with the exception of the portion of the year 1901 where I have been unable to find the voucher record for a portion of the year 1901 is explained. The exhibit shows whatever credits there were to the construction account, and I am preparing a list of all the credits during the entire period of 40 years complete. I have prepared Exhibits 157 to 164 inclusive and have checked them with the company's books and they are correct to the best of my knowledge. Index to the
1775 Exhibit refers to the pencil figures following each page.

Exhibit- "157" to "164" inclusive offered and received in evidence. The total amount charged to construction account up to January 1st, 1913, as shown by the Company's books is $784,307.49, which is the balance after deducting credits to that amount.

Cross-examination by Mr. Strode:

At the former trial of this case I spent six weeks on the examination of the Company's books and three or four weeks at this time. I went over the books of the Company for the purpose of determining the cost of manufacturing gas. The first examination I made my exhibits with that end in view; also to determine the services and the costs of mains, and I checked out these costs against the vouchers of the Gas Company to determine the accuracy of the records. I found an honest effort on the part of the company to keep a correct record of the cost of the expenditures of the Company, and found nothing to criticise in the showing of the incoming expenses. *We* respect to the error made in the construction account of 1901, there

was no attempt made to deceive, and I called attention to this error on page 343 in my former testimony. In checking over the construction account the second time, I have checked back my own account and have found certain minor corrections which I have noted. Subsequent to 1907, I checked the large items in the construction account against the vouchers of the Company and found it to be correct as entered in the books. The construction account kept in the early days was in very crude form. I did not find the details as I did in the latter years. There was no classification or segregation. It merely showed to whom the money was paid out, but not what it was for, and there was no way in which the early records could be checked out when you got back into the 70s and 80s, and you could not tell from the records whether it was all there or not. In 1873 the construction account was some $54,000. and the next year only $887.31, and the next year I found nothing. Before and since that year there has always been something charged to that account. My evidence goes to what has been charged
1776 for construction and not to the value or amount of the property. I did not check the maintenance and repair account, and I am unable to say whether any items have been carried into that account which should have been charged to construction. My Exhibit shows the total construction account up to 1890, the total there is $203,450.83. That is the time the census report shows Lincoln bigger than it is today, yet the amount of the company's construction account was $203,450.83. The electric light construction account was opened October 16th, 1890, and at the close of 1890, shows $14,577.63, so under any possible construction not more than $14,577.63 would be involved in the inventory of December 31st, 1890, which shows $475,862.03.

Redirect examination by Mr. Foster:

I found nothing in the early dates to indicate that a construction account was only a partial showing of what had been actually spent for construction, and I found charges practically every month during all of the years throughout the history of the Company. There always seemed to be entries for pipes used for maintenance or service during all of the years. I think Walsh & Putnam were operating the plant for some three or four years, and during that period I would say the books show charges to construction every month, and it indicates that the property was being developed slowly. I think an inventory would include franchise value, and I would rather rely upon the books of the company than upon an inventory. I have checked the figures previously given me by Mr. Strode, as to the Company's inventory of Dec. 1, 1891, with the total of $610,158.00. Cost of construction for Block 79, $20,346.24 added to gas construction of that year $28,082.62, makes together $48,000 and something. Adding the gas and electric construction of that year to the amount of property the company had at first of year, according to inventory, $610,158.62, which shows that the electric construction was included for that year.

Recross-examination by Mr. Strode:

In 1890 I *I* had to go outside and get $20,000, and put it in the construction account. I believed it belonged there. In 1875 and 1876, the record shows that it was necessary to take up 2,396 feet of 6″ pipe and lay from the works to 11th street on O and 400 feet of 3″ pipe on O Street, and relay that amount of iron pipe. The construction account of that year shows a total of $9,937.44, of which $1,001.00 is for pipe. The 1878 construction account was
1777 $1,656.06, and in the minutes of the meetings of the stockholders, held on January 15th of that year, there is shown that they built a retort house 30 x 50 and also built a brick lime house 12 x 20; a coal house 14 x 30 and a new coal gas works of the latest make made by Morris, Haskin & Company of sufficient capacity to make 40,000 feet of gas daily and I find no items in the construction account of 1878 covering that, but in 1876, I find that the Morris, Haskin Company was paid $2,417.00. The construction account for 1877 is $3,371.55, and I hardly suppose that the cost of a new coal gas works would be included in an item of that size. Under the same date in the same record they have constructed a lead of 9,800 feet of mains, and that has not been included in the construction account of 1877 of -3,371.55 and in the next year $1,656.06. I am unable to explain this. If an inventory is honestly taken, it controls over bookkeeping.

Redirect examination by Mr. Foster:

I do not think in this instance any items have been charged to construction until they have been paid for and it is quite possible I think that some of the construction items were not actually paid for until a long time after the actual construction of the apparatus or property. I would consider it quite probable on account of the known financial condition of the Company during those years.

Redirect examination continued by Mr. Morning:

In check- this construction account I assumed that was an account of what they had paid out for work on construction.

Redirect examination continued by Mr. Foster:

The item of $145.50 of J. H. McLair, appearing in the construction account for 1877 for digging about 4,000 feet of trench is no doubt for laying the mains referred to by Mr. Strode.

1778 Recross-examination by Mr. Strode:

The items for digging the trench is simply a guess on my part that it is for the laying of the mains. Two items one for $44.13 and the other being $10,429.13, appearing in the construction account were omitted by me because Mr. Honeywell also omitted them.

1779 HORACE S. WIGGINS, being recalled for further direct examination, testified on behalf of the defendant as follows, pages 3833 to 3839, original record:

Direct examination by Mr. Foster:

I made an examination of the books and records and accounts of the Lincoln Gas & Electric Light Co. for credits to gas construction accounts and Exhibit 423, consisting of 16 pages, is a tabulation of those credits prepared by me. This is taken mainly from the ledger accounts of the gas construction beginning with the year 1873 and ending with the year 1912. I have arranged the matter in chronological order just as it appears in the books, and have given all the details that is contained in the books and it shows the references to the books from which the data is taken. For the years where no credits appear on the books of the company I have shown that fact. I have carried out the totals by years. The items in this account are credits or deductions in the amounts charged to the construction account. The totals of each year's credits are shown in Exhibit 157, and this Exhibit 423 gives the details of those credits. I think these are all the deductions shown in the books of the company. They are all that I could find, and this, as I recall it, balanced up with the total shows in the previous exhibit. Exhibit 423 offered and received in evidence.

Cross-examination by Mr. Strode:

The details of all of these items are all shown in the books—not always in the ledger, however, sometimes in the voucher records. In the earlier years it was all shown in detail in the ledger account. On the item for Yankee Hill brick, $8.50, I assumed that there was a voucher and that that was the amount the company paid.

Redirect examination by Mr. Morning:

I have made more or less of an effort to substantiate the books in this construction account. The earliest vouchers I found were about 1900. I was not able to find any for the earlier years. The vouchers were probably destroyed. They wouldn't keep them
1780 longer than that. The record books for the earlier years were kept more or less like mercantile books where they didn't use the voucher system. I think the first voucher was started about 1900.

Redirect examination by Mr. Foster:

The total credits to the gas construction account from 1873 to 1912 as shown by Exhibit 423 is $59,754.15. That amount has already been deducted from the total construction account in Exhibit 158 of $784,307.49, which is the net amount charged to construction.

1781 BRUCE FULLERTON, being first duly sworn testified on behalf of the defendant as follows: Pages 2239 to 2241 original record.

Direct examination by Mr. Morning:

I live in the city of Lincoln and am an attorney at law. I have made an investigation of the numerical indexes and deed records in the office of the registrar of deeds for Lancaster County, with a view of learning what recent transfers of property have been made in the vicinity of the gas works. Exhibit 179 is the list of the transfers that I took off from the record and it gives the lots and blocks, the kind of instrument, the expressed consideration and the book and page where recorded, covering the transfers from 1906 to 1908. It shows the consideration only as expressed in the deed. I know nothing about the actual market value. Exhibit 179 is offered and received in evidence.

1782 FRED C. FOSTER, being first duly sworn testified on behalf of the defendant as follows: Pages 2092 to 2099 original record.

Direct examination by Mr. Morning:

I am city attorney for the city of Lincoln and have been for about two and one-half years and conducted for the city the trial of the suit in the District Court involving the occupation taxes against the Lincoln Gas & Electric Company. There were two cases tried and disposed of at the same time, involving the same matters and the result was that the city obtained a judgment for a definite sum in each case as an occupation tax. The company has served upon me a bill of exceptions to perfect an appeal and I understand that they intend to appeal, although the appeal has not yet been effected, but neither has the time expired. Part of the decree in these cases was drafted by me and the balance was under my supervision. Exhibit 168 is a statement of the occupation taxes levied for the years 1907 to 1912 inclusive and for the months of January and February in 1913, against the Lincoln Gas & Electric Light Company and shows the amounts which entered into this judgment. The sum total is $35,095.47 exclusive of interest and penalties. This judgment includes the taxes against both departments of the company. The Court held that we were allowed interest at 7%. The action was brought on two ordinances; the first one levied an occupation tax on the sale of gas alone; the second one repealed the first one and levied an occupation tax on the sale of gas and electric current.

Cross-examination by Mr. Strode:

The first ordinance is the one set out in the petition in this case, and shows a 2½% tax on the gross receipts resulting from the sale of gas. The city attempted to levy that sum upon all gas sold inside and outside of Lincoln. It was in effect until January 15,
1783 1910. Some time in 1907 the city council passed an ordinance levying an occupation tax on the sale of electric current.

That was also in effect until 1910 when both were repealed and a new ordinance adopted, increasing the tax to 3% of the gross sales. The city claimed the penalties allowed by the ordinance, but the Court held that it being a Court of Equity and the ordinance having been declared valid, it was within the power of the Court to relieve the company of the penalties notwithstanding the terms of the ordinance and therefore allowed instead of the penalties, interest at the rate of 7% on the sum due each six months. The interest and penalties provided in the subsequent ordinance were enforced. Exhibit 168 shows the sales of gas alone, inside the city limits. It does not include any interest or penalties, but that is not on account of our waiving anything.

1784 W. O. THOMAS, being first duly sworn testified on behalf of the defendant as follows: Pages 2656 to 2674, original record.

Direct examination by Mr. Foster:

I live in Lincoln and am an accountant and insurance man and have been for about ten years. I made an examination of the legal expense accounts of the Lincoln Gas Company and Exhibit 270 is a copy of that account, taking account No. 1505 for the years complete, 1907 to 1912 inclusive. It shows all the items in that account as they appear on their books. These items are all charged directly to gas operating expenses and there is no division as shown in this account between the gas and electric department. The items in this account were taken in the first instance from the debit expense accounts. The item of January 31, 1907, employer's liability insurance, was taken from transfer voucher 318, which means that this is a portion of some larger item apportioned over a number of months, depending upon the size of the account. The item on the same date, H. F. Rose 41.67 is the ultimate account and that is true of all of the other items. I examined all the original vouchers from which these entries were made, except some which were missing and for which I made inquiry. I have not seen the reports of the company of their operating expense account and I do not know whether the items shown in this Exhibit go to make up the totals under those reports or not. Exhibit 270 offered and received in evidence.

Exhibit 271 is the result of an examination which I made of the company's accounts and records as to rebates and allowances from January 1907 to December 31, 1912. The items represent the gas and electricity furnished free of charge to the persons named in the Exhibit. These items were taken directly from the voucher rebates and allowances, and the voucher's number is shown in each instance. The items check with the original vouchers. I made an occasional examination back of 1907 and found that practically the
1785 same people were receiving the same rebates and allowances back to 1902 and farther. The same is true of 1913. The vouchers show that the rebates and allowances were for gas and electricity used. I examined all of the vouchers with the exception of a few which were missing. They were all in the usual place of keep-

ing the vouchers, except one, Voucher 2787, under the name of H. Honeywell, where I found these slips. They evidently had been torn from some other voucher and placed in that one. In addition there are a few other items which indicate the allowance of additional rebates and allowances, for instance, I examined Voucher 3072 for March 24 1907, amount $255.00. The items are given as follows: Expense for May, $80.00; to Mr. B. M. $25.00; O. D. H. $25.00; C. C. J. $25.00; A. P. Large $100.00. In the sub-division of accounts, $127.50 was charged to account 1503 and the same account to 3229, which is the division between the gas and electric accounts. There was no other explanation of these items. I also found Voucher No. 5984 for March 13, 1909 amount $703.13 showing the following checks to Homer Honeywell, special; Oct. 17, 1908 self $40.00; November 9, 1908. self $35.00; November 7, 1908 self $25.00; September 12, 1908 Sam Pennington $25.00; same date self $63.13; July 18, 1908 Lincoln Gas & Electric Light Company, $45.00; July 31, 1908 self $90.00. August 15, 1908 self $150.00; August 10, 1908 self $150.00; November 1, 1908 self $80.00. Homer Honeywell had been manager of the gas company. I do not know when he went out.

I also found Voucher 6244 April 27, 1909 payable to the Lincoln Gas & Electric Light Company for $325.00. There is a receipt to that company from H. Honeywell, dated August 28 1907 for cash, currency and signed by H. Honeywell with the letter E underneath. Then there is Voucher 4342 dated March 30, 1908 H. Honeywell $250.00 charged to sundries with no explanation and Voucher 2846 dated November 15, 1907 H. Honeywell $200.00, charged to account 1503 $100.00; charged to account 3229 $100.00. There is no explanation.

1786 Then there is Voucher 4956, dated August 7, 1908, H. Honeywell $250.00, general manager, incidental expenses.

Cross-examination by Mr. Strode:

The account on the books of the company called rebates and allowances is a written extended account and covered all the adjustments made by the company with difference consumers and allowances given to the consumers in order to satisfy them and get the account adjusted and these items are all shown in Exhibit 271. The items are entered in this account with reference directly to the voucher, and they are afterwards sub-divided by name and in the end are entered up monthly, and the amount of the account with the voucher number, is carried on the face of the records to the general account of rebates and allowances, and where, in a particular month, for instance January 31, 1907, in this rebate and allowance account we find the voucher number in the account, gas and electricity $16.88 and we can turn to the voucher and find the name H. Honeywell and the voucher shows also that it is for gas and electricity. Voucher No. 2616, S. H. Burnham $47.15, shows that this is for gas and electricity and the amount is subdivided between the two departments 50% each way, on the books

of the company. I have shown the whole amount here. I have just endeavored here to show the rebate and allowance account. The gas account number is 1503 and the electric account number is 3229 and at the end of each month the figures opposite these account numbers show the amount charged to each department for that month. I have another rebate item in my exhibit, of $33.50, which was in some slips that I found out of place in Voucher 2787. This item was entered on the books, but I got it from the vouchers. I didn't examine the book at all and I don't say that the account didn't carry the voucher number. The slips which were in the voucher 2787 had been torn from vouchers January, February, April, May, June and August, 1907, and placed in this voucher. The voucher shows an expense account of Mr. Honeywell for $25.00 with an explanation of his account, J. C. C. with three ones after it three times.

1787 Exhibit 270 is a transcript of the account carried under the books of the company as legal expenses, Account No. 1505, and I simply compiled the account here into one exhibit. I haven't criticized the way it appears on the books of the company. I do not know what consideration the company received. The rebates and allowances account is an expense account and I assumed from that that when an item was entered into that account that the company received nothing for the items appearing there, that the items were just rebates that appear there. I did not check the account against the receipts of the company to know whether the company had received anything for payment for the services.

Redirect examination by Mr. Foster:

These items in the rebate and allowance account are charged to the company's operating expenses and they represent so much money paid out. I got this information from the vouchers themselves and this exhibit is an extract of what the vouchers show. There are no names appearing in this account regularly, month after month, that are not shown in Exhibit 271.

Recross-examination by Mr. Strode:

The vouchers would show the actual amount received. It wouldn't show what was paid out. I saw paid out items in the account, for instance, the Lincoln Gas & Electric Light Company paid to H. Honeywell the sum of $25.00. All of the items that I have testified to as rebates and allowances and set out in this exhibit are entered as an item of operating expense. The book in which it is entered does not give the name of the parties; it names the item, and in order to get the name of the party you have to go to the voucher and that is true of all of the items. Added to the voucher are little slips giving the names. They used one voucher so the bookkeeper would not have to make such an enormous number of vouchers.

1788 To show it in the books would require too much detail. The books show that the customers got this service free and

that they have charged it up as operating expense, which would be the way it should be charged, as it is part of the operating expense.

1789 W. O. THOMAS, recalled for further direct examination, testified on behalf of the defendant as follows. Pages 2964 to 2971, original record.

Direct examination by Mr. Foster:

Since I was last on the stand I have examined the gas company's books and records, especially those incidental expense accounts. Exhibit 323 is account No. 1503 incidental expenses for 1912 starting with January and goes through to December. It was taken from the company's Accounts Payable Ledger. The account for 1912 appears just as it was in the book. The items in the other years from 1907 to 1912 were extracts that Mr. Morning had singled out for investigation. Exhibit 326 is a statement from the Accounts Payable Ledger of account 1507 under the caption "Promoting New Business for Gas for the Year 1912". That is for the complete year. The next page of this exhibit is the account now under the heading "Domestic Fuel Appliances and Connections, Advertising, 1819-9", taken from the same book, and the totals for the month shown under that heading are carried into the totals on the first page of the exhibit. That is the condition of the company's books. This second page is from January to December, 1912. It is a portion of the new business account in detail. There are four sheets to that portion. The next division of Exhibit 1 in two sheets, under the designation "Domestic Fuel Appliances and Gas, Salaries, 1819-*c*", and the totals of that are carried into the summary on the first sheet. The next subdivision consists of one sheet under the head "Domestic Fuel Appliances and Gas, Special Expense Account, 1819-*d*", and the next subdivision is "Domestic Fuel Appliances and Connections, Loss Account, 1819-*f*". There are six sheets in full detail for the year 1912. The next subdivision is account 1819-*g* in four pages, for the full year. The next subdivision is account 1819-*h* in three sheets shown in the same manner. The next subdivision is account 1820-*h*, giving business expenses and consists of two sheets. These were all taken from the so-called accounts payable ledger. These accounts in detail are where
1790 these items are charged to operating expenses. Exhibit 327 consists of two sheets and is the special appraisement account and expenses of dollar case gas account 1891-*a*. The account is shown in detail. The accounts are taken from the company's books from January to December, 1913, consisting of three pages. Exhibit 328 is a continuation of the other exhibits of the rebates and allowances, gas and electric light furnished free. This is for the year 1913. Exhibit 329 consists of two sheets, rebates to T. H. Pratt prior to January 1, 1907, taken from the original voucher of the company to complete the record on the other exhibit. Exhibit 330 is the sundry expense account for 1913. That account has no number in the books. It shows the account in detail by the months

and consists of three pages. Exhibit 331 is the account of the executive salaries for 1904 to 1912, inclusive, showing growth and division between gas and electric departments and excluding items in common to both departments. Exhibit 332, consisting of 11 sheets, is a statement of the cash on hand and in bank at the end of each month, taken from the company's financial reports for the years 1903 to 1913, inclusive. I made all of these exhibits and took the figures from the books of the company and to the best of my knowledge they are correct. The computations at the bottom of Exhibit 332 were the average monthly balances in the bank in the office and on hand and the total balance. Exhibit 321 is account No. 497, travelling expenses for 1913, which I took from the company's accounts payable ledger. Exhibit 322 is the general office expenses account No. 1502-*a* from January to December, 1912, in detail, as taken from the company's ledger. Exhibit- 321, 322, 324, 325, 326, 327, 328, 329, 330, 332 offered and received in evidence.

1791 The following testimony is set out in the exact words shown in the original record, and includes the exact words of certain witnesses desired by each of the parties as indicated herein, and has been directed by the Court, in his certificate, to be allowed and made a part of the record.

1792 *On Behalf of Plaintiff.*

1793 Examination of Mr. B. C. Adams, page 9:

Mr. Foster:

Q. I will hand you exhibit "327," and will ask you to state the nature of the expenditure therein set out beginning with January, 1913, Sloan Huddle & Company, voucher No. 13720, on account, $2,650, services, amount charged in this account for this month, $500?"

A. We employed Mr. Huddle to advise us in connection with this gas case"

Mr. Morning:

Q. Who are those parties?

A. Sloan & Huddle is an engineering firm that had an office at Madison; Mr. Huddle was the gas expert for the Wisconsin Railway Commission.

Q. What was the $2,650. paid for?

A. For services rendered by Mr. Huddle and his firm.

Q. What services did that firm render in this case?

A. We advised with them in regard to certain methods of procedure; we wanted to know something about how the Wisconsin Commission handled matters of this character, and we have information or got information from them that we have taken advantage of in conducting our side of this case.

Q. It is for expenses incurred in the prosecution of this case?
A. Yes sir.

Mr. Foster:

Q. Now, in Fe*n*ruary appears the same item, Sloan, Huddle & Company, voucher No. 14018, services $1,650; is that the same firm?
A. It is the same firm and covers the expenditure for the same services.
Q. Is it a part of this $2,650. or a separate item?
A. I think that is a separate item; I can't say without looking over the account; it seems to me that $2,650. was the total amount, but I may be mistaken (pp. 3076-7).

(Later Mr. Montgomery testified as follows:)
Q. The Lincoln Gas & Electric Light Company employed the firm of Sloan, Huddle & Company to do some work in connection with this case in the way of a valuation, didn't they?
A. I understand so, but I was in Montgomery in a lawsuit a year ago today. I didn't get home here until the day of the Omaha cyclone. I think that was the 23d day of March.
Q. Do you know the nature of the work done by that firm?
A. No, excepting it was relating to the work of the Wisconsin Commission.
Q. Have you the report made by that firm to the Lincoln Gas Company?
A. No, I have not.
Q. Do you know who has it?
A. I haven't seen one.
Q. Your company paid the firm of Sloan, Huddle & Company something like $3,000. or $4,000. for that company's services
1794 in this matter in conjunction with this appraisal?
A. I don't know just what they paid them (pp. 3304-5).

Mr. Foster:

Q. Mr. Montgomery, do you know anything about the services rendered this company by Sloan, Huddle & Company?
A. I have answered that question, you have asked me all about it and I told you that I wasn't here at the time.
Q. You don't know anything about it?
A. No sir.
Q. There is no report or correspondence of any kind relating to that money in your files of the company at this time showing the nature of the work performed by Sloan, Huddle & Company?
A. Not that I have seen.
Q. Will you make a search to see whether or not there is any correspondence disclosing the nature of that report?
A. I will be glad to (pp. 4055-6).

Mr. Morning:

Q. Mr. Montgomery, do you know that there is an item of expense in the 1913 account as having been paid out by this Company

to Sloan, Huddle & Company in connection with this appraisal, don't you?

A. I know there is an item of expense paid to them.

Q. Do you know what your Company got for that item of expense?

A. No, I never saw any report, as I stated my *my* previous testimony; I wasn't here at the time.

Q. Have you got anything for it in the way of a written document or report in writing, or have you any knowledge of it whether any such report exists or where it is?

A. As I told you before, I wasn't in touch with this case at that time.

Q. You don't answer my question: Have you any knowledge of the existence of any such document?

A. No, I told you that before (pp. 4056-7).

Mr. LEA was examined as follows: (3303.)

Q. Mr. Lea, who makes up the firm of Sloan, Huddle & Company?

A. I don't know.

Q. Do you know who they are?

A. I don't know; I know one of them.

Q. What aid did they render you in making this valuation?

A. Not the slightest in the world.

Q. Did they have any connection with this valuation?

A. Not to my knowledge; I don't know of anything they have done that had the slightest—that had any effect on anything I done, if that is what you mean.

Q. That is what I mean; you haven't consulted with them in this case?

A. I have not; maybe the officers of the Company did, but it was not at my suggestion.

Q. Were they consulted before you took charge?

A. I don't know of it if it is a fact. All I know that they did take up with Sloan, Huddle & Company was something in connection with the procedure of the Wisconsin Commission; they do some outside work and somebody here took up some matters with them.

Mr. Wettling: They work under a retainer practically, namely, in consideration of which the Wisconsin Commission has the first chance, outside of that their time is their own.

1795 Q. Do you know of any work they did for the Lincoln Company in this case?

A. No, I never tried to find out; it didn't interest me.

Mr. WETTLING was examined as follows:

Q. Did your Board of Directors have up the question of employing Sloan, Huddle & Company for valuing this plant?

A. No, sir; that didn't come up before the Board.

Q. Do you know how that was authorized?

A. No, sir; I expect it was authorized by the New York office. That is where the orders usually come from with regard to any

considerable proposition or any unusual things they generally take it to the president for directions, but the ordinary running of the office is done here with only the usual supervision of the president from New York.

Q. Have you seen this Sloan, Huddle & Company's report?

A. No, sir.

Q. Never did?

A. No, sir.

Q. And you don't know what it is?

A. I know that Sloan was here, just what he was doing I don't know; there was some talk about it at the time.

Q. How long was he here?

A. That I don't remember; my impression is two or three weeks; I don't know.

Q. What did that firm do to earn the $2,650 from the Company?

A. You have got me; I don't know.

Q. That is news to you?

A. No, but I can't tell you what they did or didn't do.

Q. You don't know whether they made any report on the valuation of this plant or not?

A. No, just what the report was I don't know; I never saw it.

Q. When was Sloan here, do you know?

A. Let me see, I think it was about, I am not sure whether it was in the middle of 1912, or early in 1913, I guess, isn't it?

Q. The entry of the charge is made in January 1913—the expense charge.

A. It might have been the latter part of 1912, but I am not sure whether it was the latter part of 1912 or the early part of 1913.

Q. Anyhow, it was during the investigation of this plant for this present hearing or preparatory to it?

A. Prior to that, I know there was some talk about getting an engineer to make a valuation of the plant, but I got the impression right from the start that Mr. Lea was the man that was going to do it, although I knew Mr. Sloan was here; what particular thing Mr. Sloan was going to do I don't know.

Q. We can't get any light from you on that question?

A. I haven't any light to dispense in that respect.

1796 On Page 20 Mr. ADAMS also testified:

Q. What experience, if any, did you ever have in the manufacture of gas such as this Company furnished here?

A. Why, I have watched and analyzed (3529).

And again—

Q. Did you ever have any actual experience on a job of *of* putting up a building?

A. I say I did; yes, a great many.

Q. I don't mean putting them on paper; I mean helping put them up?

A. No, I never helped put up a building (p. 3660).

1797 Further on p. 22 Mr. ADAMS testified:

Q. If you think they haven't time down in Massachusetts to see that those companies make proper reports as to the money expended for repairs and renewals, or expended for expense, do you think they have time to check over and determine whether the items expended for the operation of the plant are properly entered and applied under the classification they assume to apply them under?

A. Not generally by any means.

Q. It is left very largely to the Company to make up its own reports about in its own way, excepting they must fill out the standard form?

A. The Company, as a matter of fact, exercises a good deal of discretion in making out its report; there is no doubt about that (pp. 4394-5).

Q. You have indicated that you thought the Commission knew of this practice that you referred to as existing in Massachusetts?

A. I know they know; it is brought up repeatedly in the hearings there, there is no "think" about it, it is just as well known as any practice could be and the Commission can't help it.

Q. They can't help it?

A. No, sir.

Q. They cannot change or direct that item to be entered as it should be entered in the returns to the Commission?

A. The trouble would be that it would require an army of accountants and engineers to chase up the fifty companies to see what they entered as a repair or as a renewal was in fact an extension; it is the practical enforcement of a regulation of that kind on a matter involving as much judgment, engineering and skilled judgment as that does, that makes it impossible and imprzcticable for the commission to enforce a rule on that matter (p. 4393).

Q. (Same.)

A. Not generally by any means. * * *

Q. Now, you referred to the matter of repairs and renewals in Massachusetts and said that some of the companies in Massachusetts were in the habit of covering up their earnings by entering as renewals or repairs what were in fact extensions, I think you said?

A. Well, that may be a fair summary of what I said.

Q. Now, do you think the Commission in Massachusetts knows that that is being done?

A. Oh, it is notorious (pp. 4391-4392).

A. D. ADAMS:

Q. Did you make any estimate before Mr. Lea testified and furnished his report?

A. Why, no, sir; no direct estimate of my own, I looked at the estimates your men made in the case in the United States Court and did a little thinking about that, but I didn't make an estimate of my own. (p. 3694.)

A. D. ADAMS:

Q. Of course, you feel that the City is your client in this matter?
A. I certainly do.
Q. That you are in the service of the City and you represent the City in this controversy and that you are giving the City the best service you have?
A. Yes, sir.
Q. And in its interest?
A. Yes, sir.
Q. But you do not feel free to volunteer information or opinions or judgments to this company for its benefit in this controversy?
A. I do not think I am called upon to do that; no, sir.
Q. Especially in view of the fact that you have participated in pursuing a vigorous cross-examination of witnesses you would hardly be expected to turn around the next day and render assistance, even though you felt that the facts, if fully disclosed, would be to the benefit of the Company?
A. Well, I haven't considered any facts that I thought were necessary to the Company, if that is what you are driving at. (p. 4409.)

1798 A. D. ADAMS:

Q. Do you recall now where you got the information upon which you based or assumed the estimated life of the equipment at Racine?
A. I got it mainly from plants in Massachusetts. (p. 3714.)

* * * * * * *

Q. In Cedar Rapids case you brought the buildings from 100 years in Racine to 80 years in Cedar Rapids and in Lincoln you brought it to 66.6 years?
A. Oh, yes; which shows that it is consistent. (pp. 3716-7.)

1799 A. D. ADAMS:

Q. Is there any standard recognized by engineers as the normal life of equipment such as is found here?
A. I haven't been able to discover any uniformity in that regard.
Q. The engineers don't agree?
A. I think that is true.
Q. Some engineers don't even agree with themselves?
A. That might be true, a conscientious engineer sometimes changes his opinion.
Q. And the oftener he changes his opinion the greater indication that he is conscientious?
A. I should want to know all the facts in regard to that.
Q. Suppose a gentleman who is an expert testified in Racine, Wisconsin, and gave the life of equipment materially different from what he has given it here, and also testified in Cedar Rapids, Iowa, and gave the life of the equipment the same as this here different from the life he gave for this equipment, would you assume that to be an indication of conscientiousness?

A. It might or might not be; I should have to know more of the facts. (p. 3712.)

H. I. LEA:

A. I have made valuations for banks, bond houses, gas companies and individuals. I have made valuations of the properties having a reproduction cost today of more than $110,000,000.
Q. Since you opened your office?
A. Since I opened my own office.
Q. And in about how many different cities throughout the country?
A. Something over 70; I don't recall exactly, supplied by these companies; I have made other examinations that were not directly bearing on values, for instance, for gas companies who are having operating difficulties or troubles in their plants that were annoying them one way or another, and I have made examinations of properties to determine whether changes in methods or equipment would be advisable.

E. W. REED, on Real Estate Value:

"I have made an exhaustive study in Lincoln and obtained my information from going very carefully over the assessed value of property in all parts of the city; by talking with the County Assessor and City Tax Commissioner and real estate men and by observing closely the property which is listed for sale and the prices which are asked and the prices which are obtained for lots and at which lots have been sold for in various parts of the city." (p. 656.)

* * * * * * *

"I have made returns to the commission upon all the land owned by the various railroads and occupied by them as their terminals in this city ." (p. 657.)

* * * * * * *

"I made an appraisal of the real estate, the land or lots owned by the Lincoln Telegraph & Telephone Company."
Q. Have you appraised any portion of block 77?
A. Yes sir; there is .11 of an acre which belongs to the Burlington railroad in block 77. (p. 657.) * * *
Q. Have you appraised any property adjacent to block 79?
A. I have appraised blocks on three sides of it, I think. (p. 658.)

1800 JOHN LEBSOCK:

"A. I never sold any lots there. (2731.)
Q. I am asking you about block 80?
A. I don't know anything about it.
Q. Do you know about block 81?
A. No.
Q. Do you know anything about block 75?
A. No, I never had anything to do with it.

Q. You don't know what those lots sell for or what their market value is in blocks 80 and 81?
A. No sir.
Q. Do you know what the value is of lots in blocks 46, 48, 71, 105, 82 or 83?
A. I never had any sales there.
Q. And you know nothing about their market value?
A. No sir.
Q. Do you know where the cold storage plant is?
A. Yes.
Q. Do you know what those lots were worth?
A. If you had a lot there and you wanted to buy it I would ask you $10,000. for it, if you wanted it for business purposes.
Q. That is in block 83?
A. Yes sir. (2732.)
Q. Do you know anything about block 48?
A. No sir.
Q. Do you know where the Lincoln Packing Company is?
A. Yes sir.
Q. Do you know what the market value of those lots is?
A. No sir.
Q. Why?
A. I don't know; I never sold any there.
Q. Do you think the market value is $1,000. a lot?
A. I don't know.
Q. Would you say it is not?
A. I can't judge that at all.
Q. Do you say that the lots in block 75 are not worth $1,000. a lot?
A. I never had any sales through this location you are asking me.
Q. That is in blocks 80, 75, 76, 48, 49, 71, 81, 82, 83, 105, 106, 104, 107, 113, 114, and 115, you know nothing about those?
A. Oh, I know nothing about them. (2733.)
Q. Are you a partner of Mr. Hagensick?
A. Yes, a little bit.
Q. But in his general business you have nothing to do with him?
A. No, I have a general business besides; I am writing insurance.
Q. What company?
A. The Dwelling House Mutual Insurance Company. (2734)".

1801 HENRY J. AMEN:

"Q. What business are you engaged in?
A. Groceries and meat. (2737.)
Q. Suppose the gas buildings were removed, what would those lots be worth at the present time?
A. They wouldn't be worth any more than the property right North of it.
Q. What would that be?
A. I wouldn't want to place a price on it; it is cut up there. (2741-42.)

Q. I want to get at blocks 106, 75, 105, 82 and 83?

A. They are not valuable for residence purposes; they were never laid out for anything except wholesale purposes and switching purposes. (2749.)

Q. What would you say is the fair market value of those lots in block 83, exclusive of any improvements?

A. Why, if there wouldn't be any improvements, I expect they would sell for $700, or $800.

Q. A lot?

A. I don't believe the people paid much more than that; they may have paid $1,000. but I don't believe they did, because it was simply wreckage; that was a tough part of the city. (2749-50.)

Q. Down here in the neighborhood of block 79 is there any block of ground at any fixed price that you could buy?

A. What is the use of wasting any time; that block 79 is the Gas Company's; if you want to buy this block 78, what would it cost to buy it? There are twelve lots in there.

Q. I don't know?

A. That block 78 is well settled (indicating); Dorner lives there; he bought that place for $1,000, or $850, or $900, and one man bought this corner for $1,000. It is all well built up there. If you want to go across and buy this block 77, there is a cheap block there.

Q. Well, take block 77; assume that we don't want any unless we have that?

A. Yes.

Q. Would you agree to secure that for us?

A. They are all anxious to sell there, but I wouldn't want to place a definite estimate on that.

Q. You gave your judgment here and you know that at some figure you can acquire that; now give me the figure that you will agree to acquire that block for us and obligate yourself to do it?

A. Oh; I wouldn't say that I would do that; I would expect to make something out of it.

Q. Well, tell us?

A. Well, for buying that block dwellings and all; this is the Gas Company's plant across here, and this block 77 is the one I have reference to; there is a house here (indicating); and a house on lot 7 right there (indicating), oh, I suppose I could buy that block, the houses and the whole business, and sell the houses and clean them off for $10,000. (2753.)

Q. We want to find out what you will agree to buy it for?

A. I wouldn't say. (2754)".

1802 GEORGE HAGENSICK:

"Q. Can you give us some of the sales made down in the Salt Creek bottom within recent years that you know about; some that you have made or that you know of being made?

A. Well, I haven't lately made any sales down there; I haven't for the last three or four years made any sales of lots down there. (2716.)

Q. You don't know who occupies block 80?
A. No, I don't.
Q. Now in block 81; I presume that is principally owned by the Burlington; that is immediately East, isn't it?
A. Yes sir. (2718-9.)
Q. If we had to move the plant, where could we go, and where could you get us a block as conveniently located for our distribution system for less than $800. or $1,000. a lot for a whole block?
A. I don't know.
Q. I want to ask you if you think we are reasonable, and if you think taking the block and taking it where it is and with reference to our plant, that $800. or $1,000. a lot is unreasonable?
A. The value of property varies according to the different purposes for which it is used.
Q. And it varies very greatly according to its location doesn't it?
A. Well, I wouldn't be in shape to say what those lots would be worth; it would be like putting the price on someone else's property. (2725.)"

1803 GEORGE P. MONAGAN:

"Q. What would you say would be the reasonable value of lots in that block if vacant at the present time; the fair market value?
A. Well, that would be a difficult question to answer for the reason that if the property was vacant they wouldn't be worth as much as if they had been occupied. (2676.)
Q. But this property where the company is located is not residence property; it is trackage property?
A. Well, it is residence property with the exception of the Gas Company's property. (2686.)
Q. But this new packing house that has gone up is within a block of it?
A. That is an objectionable business. (2687.)
Q. The fact that there is a railroad track there, and trackage facilities, makes that property valuable doesn't it?
A. Well, I would think it would help the value so far as the business proposition is concerned, but not the residence proposition. (2688.)
Q. What lots have you sold down there in the last five years near this property?
A. I don't think I have sold any in the last five years.
Q. What is the nearest lot that you sold prior to five years ago?
A. Well, I sold in block 140 for $150. (2689.)
Q. When did you sell that?
A. Those lots were all sold within probably the last fifteen years up to five years ago*l* they range along; I haven't the dates; they probably were sold ten years ago and some longer than that. Eight, ten or twelve years ago. (2690.)"

1804 On Valuation of Building.

ELLERY DAVIS:

"Q. Where did you receive your technical education?

A. At Columbia University in New York City.

Q. About what experience have you had in estimating the cost of buildings here in the city of Lincoln?

A. It is our custom to make guaranteed estimates of the cost of the work for which we prepare plans.

Q. To about what extent have you done that sort of work since you have been with this firm?

A. For the past six years I have been with Mr. Berlinghoff in his employ and later as a partner and we have estimated beforehand all the buildings we have built, and our estimates in the main have been verified by the figures for the actual cost. (675.)"

1805 On Overhead Charges and Going Value.

L. E. WETTLING:

"I have had much experience with the analysis of accounts of public utilities and an analysis of valuation figures and contentions generally that come in litigations and hearings on matters of that nature before the Nebraska State Railway Commission and before the courts in several rate cases and tax cases." (4059.) * * *

"I have had occasion to refer to tax books, law books and reports of commissions in various states in the Union generally." (4060.)

* * * * * * *

"Q. Outside of your specific duties for the Railway Commission proper, have you had occasion to examine the testimony offered in railroad rate cases and the like of that?

A. I have; and have assisted in the analysis and writing of briefs in several cases.

Q. Does that include the famous case of Shepherd v. The Great Northern in the Circuit Court of Minnesota, the so called Minnesota-Missouri rate case?

A. I wrote an Amicus Curia brief in the Missouri rate case. (4060.)

* * * * * * *

Q. How long have you followed the vocation of a public accountant?

A. For most of all the time since 1885," * * * (4061.)

Q. You are entirely familiar with the practices of the companies and different theories which obtain in matters of valuing a company?

A. Yes sir.

Q. As held by engineers, courts and commissions?

A. Yes sir.

Q. And as experienced by public utility companies in actual practice?

A. Yes sir." (4064.)

1806 Overhead Charges.

Mr. E. C. HURD:

A. "Well, I would say if you had every other item accurate and that you had the exact amount of money which you had expended that you would find a difference of at least 4 per cent probably; in other words, you would add 4 per cent to your fundamental items to cover this at least; it might be more than that, it may be less than that, but that would be a reasonable amount." (p. 4099.)

Engineering Cost.

Mr. E. C. HURD:

A. "If it is a question of reproducing this plant there is no question whether taking all thing- into consideration it is presumed that the promoters would at least seek expert engineering advice to design and make a study of the field as to the economic location of the producing plant, the trackage facilities, the location of the mains, and all those things together with the actual construction designs. And of course later supervision of the structural portion of the plant as it was placed, and I should say that a reasonable amount would run from 5 to 10 per cent, depending on how earnest the promoters were and how well placed the plant they might have designed. * * * I should say it would be money well spent." (4100-4101.)

1807 On Buildings.

Mr. PERRY HAHN:

Q. Did you build or put up the entire building; did you have the contract to build the entire buildings?

A. I had the contract for all of it above the foundation.

Q. Did you have anything to do with the painting of the building or the wiring of the building?

A. No sir.

Q. Just the walls and roof and floor?

A. That is all.

Q. Do you know the amount of money you received for building that portion of the building that you put up for the company?

A. Yes, sir.

Q. How much was it?

A. $3,650.

Q. Now, what yould you say would be the fair cost of that building to reporduce that building now or at any time within the last year?

A. Oh, 15 per cent to 18 per cent increase.

Q. That is that portion of it that you built?

A. Yes sir. (3178-9.)

Cross-examination by A. D. Adams:

Q. What did you pay for the brick that went into the building?

A. I paid $7.50 per thousand.

Q. Where?
A. F. o. b. on track at the gas works.
Q. * * * Who did you buy them of?
A. Of the Yankee Hill Brick Company.
Q. How did you come to pay $7.50?
A. Because I got an extra good brick (3193).
Q. The question was whether you were buying a better brick than the Gas Company was buying to use down there at about that time?
A. I don't know what the Gas Company was buying, but I know that when I took the job they specified it would have to be an extra hard brick for the outside, which I did, and it cost me 50 cents per thousand more than the general run of kiln run of bricks (3194).
Q. Yes, but how do you know, Mr. Hahn, that you bought and paid for 110,000 brick in the construction of that building?
A. I remember very distinctly; I know that I paid $7.50 per thousand, which I can prove by John Turner (of the Yankee Hill Brick Co.), the man I bought them of, and I know that it takes 110,000 to build it, taken from my figures down there (3197).
Q. Where do they have their headquarters—the Yankee Hill Brick Company; with what office did you deal?
A. I dealt right with John Turner right at the yards.
Q. And where is that?
A. At Burnham. Now let me add another thing: The reason probably that I haven't a bill for that is the simple reason I built their plant out there—I build their whole plant—probably put in 3,000,000 or 4,000,000 brick anyhow, 3,500,000 brick for the Company, and I haven't a scratch of a pen with them for the brick, and that is the reason why I haven't got a contract for what I paid for (3199-3200).
Q. What do you figure it cost a thousand to lay those brick in that building, Mr. Hahn: labor, brick, cement, lime, sand, and all of those things that you use?
A. I figured it at $13.75 mason measurement or $18.75 kiln count.
Q. How do you make up that figure?
A. By taking the prices that I had to pay for material (3200)."

1808 Mr. HONEYWELL:

Q. "How about connections for gas ranges and so on?
A. We pipe to the new range the first time without charge; after that we charge the consumer for it (Pr. R. 166)."

1809 Working Capital.

Mr. WHETTLING:

A. "The Exhibit '7-B' * * * amounting to $72,037.83 would constitute then the difference between the current assets and current liabilities and is commonly considered working capital, and is in conformity with the usual custom for arriving at the working capital of a concern (4087).
Q. If these balances are correctly stated, would it indicate that the

difference there was the capital actually employed at the time these balances were taken for that working capital?

A. Yes, it would indicate that as a necessary part of the capital of the Company." (4007-8.)

1810 Going Value.

Mr. WHETTLING:

A. It is a method that has been approved by an great many engineers, and I have heard it brought forth a large number of times and it is a much more specific method than the one most ordinarily used of lumping the matter either by taking the foregone dividends for the whole period and calculating them and sometimes even compounding interest up to date, or taking the cost of acquiring patronage or consumers or business with a certain limit of cost and applying that to the number of consumers or the number of years. There are a great many methods used, but I think the most approved method, the one while it is theoretical, accord- thoroughly with the practice, and that is the plan which Mr. Lea has applied, his schedule of going concern value.

Q. Would you say that it is scientific and accurate?

A. As nearly as may be projected; I assume it is not possible to get it absolutely accurate; no more possible than it is to determine in advance the exact life of any particular equipment that rests in estimate about the same way. (4176)".

1811 Mr. B. C. ADAMS:

Q. "If you didn't have the benefit of the engineering services and the advice of the New York office, would you be required, in the proper management of the company, to secure such services outside in many instances?

A. Yes, unless we are able to go to someone with broader experience than we can get here, we would have to employ outside help to do justice to the operation of the company and the stockholders interested in it (1908).

* * * * * * *

Q. Do you feel that if you were the owner of this gas plant, and in charge of it just as you are, that you would, as owner of the plant, make an arrangement with Doherty & Company and pay Mr. Doherty $3,000 a year and Mr. Frueauff $2,500 a year merely for the privilege of having the benefit you now derive from their connection with this company?

A. Yes, sir; if I was the owner and operator I would be tickled to death to get the services we have gotten from them and are getting from them.

Q. Do you feel that would be a proper expenditure of the money and a proper charge to deduct from the operating expenses here and to be paid by the gas consumers of this community?

A. Yes, sir (p. 1509).

* * * * * * *

Q. The $500,000 notes that you spoke of, the notes that were sold, I think, in the fall of 1911, for the purpose of taking up some of your bonds, I think you said Doherty & Company negotiated that transaction for you?

A. Yes, sir; they did.

Q. What other transactions have they taken part in in the last five years say by way of raising funds or financing this company?

A. They took up the one-year notes issued in 1907 when they became due and carried them themselves for some time (1514).

* * * * * * *

Q. When were these notes taken up by Doherty & Company?

A. The year after they were issued, they were one-year notes (1515).

* * * * * * *

Q. What was the form of the transaction, the taking up of the notes; what did Doherty & Company do?

A. The holders of the notes drew on Doherty & Company, with the notes attached, and Doherty & Company provided the funds to take care of them (1515).

* * * * * * *

Q. Is there any other transaction since Doherty & Company have been connected with this Lincoln Company in addition to the one you have just spoken of, and in addition to the $500,00- note transaction?

A. Yes, I think they carried the bond in this dollar gas suit put up by the National Surety Company (1516).

* * * * * * *

Q. In addition to this $100,000 note transaction and the $500,-
000 note transaction and this indemnity furnished, what
1812 other financing has Doherty & Company done for this company since they became connected with the company?

A. They have at times paid bond interest and we have reimbursed them for it later (1516).

* * * * * * *

Q. To return to the other subject for a moment, you are not able to name any other transaction since Doherty & Company became connected with the company in which they have financed the Lincoln Company?

A. Yes, sir.

Q. What other transaction?

A. When we bought the 500,000 cu. ft. holder, Doherty & Company was able to get the Western Gas Construction Company to take notes that they wouldn't have taken if we had been standing on our own ground. I think we gave them notes for one of our water gas machines and that was absolutely due to the connection Doherty & Company had with the property.

Q. Is there any other instance?

A. They have always been able to establish a credit for this

company with concerns that might be caused to bear down a little heavily to make us pay up; I remember when I was first manager we had a big account with the Maryland Meter Company that we couldn't pay and Doherty & Company were finally able to get the Maryland Company to take our notes; they were also able to get the Detroit Stove Works to take notes for amounts we owed and couldn't pay the Detroit Stove Works, and they wouldn't have taken them if we had attempted to negotiate that sort of a transaction ourselves; I think they also got the Denver Gas & Electric Company to take notes for amounts we owed for coke we got and I am sure they wouldn't have taken them if we had done it ourselves (1517-18).

* * * * * * *

A. C. H. Dickey & Company are the people that sells meters. I imagine that was an additional discount we received from them that was credited on their New York books.

Q. That is, the meter transaction was conducted through the New York office in the first instance?

A. Yes, sir.

Q. Did the New York office pay for the meters?

A. No.

Q. What did they do in connection with that transaction?

A. Well, in their purchase of meters for all of their companies they are able to get a lower price on meters (1518-19).

The $600 annual retainer paid to Mr. Chas. A. Frueauff.

Q. Do you feel that the services of Mr. Frueauff's brother, the attorney, is of sufficient value to this company here to justify the expenditure of $600 a year?

A. Yes, sir.

Q. Have you used his services or felt the need of his services in connection with the operation of this plant?

A. Yes, sir (1509).

* * * * * * *

Q. Was there anything that required legal services that Mr. Strode himself wasn't able or capable of performing without consulting a New York lawyer?

A. I don't think that Mr. Strode could not have handled all of that transaction, perhaps, but Mr. Frueauff with his New York connections was able to handle a good many details that Mr. Strode could have handled by going down there (1510).

1813 B. C. ADAMS:

So it appears in a general way that the Lincoln Company profited by its connection with Henry L. Doherty & Company in the following respects:

(1) General engineering advice and supervision on construction and operation.

(2) Financing.

(3) Extending the company's credit.

(4) Securing discounts in the purchase of supplies.

1814 Mr. BEAUMONT:

"I should think with the present condition of affairs here it would be hard to interest capital at all in this enterprise.

Q. You mean under the situation that exists now it would be practically prohibitive?

A. I think so (867).

1815 Mr. B. C. ADAMS:

Q. "But I understand from your testimony the other day that you already had considerable pressure at East Lincoln from the pressure that was furnished at the plant in the city?

A. Yes sir.

Q. That is, the main plant?

A. Yes, sir.

Q. And that this East Lincoln holder was to supplement that?

A. Yes, sir; that is true.

Q. And then that would give you the pressure you already had from your factory or plant,—it would give you the additional pressure that the holder itself would furnish?

A. We are trying to accomplish two things there, and perhaps you did not catch that the other day, and that was this, that — were attempting to not only help East Lincoln but other parts of the city, and when we put in the District holder we relieved the mains leading from our plant into the city of carrying the gas that had prior to the location of the holder been going into East Lincoln, and in that manner improved the service all over the city including South Lincoln, and all other portions that were making demand upon the plant at the time that East Lincoln was making demand.

Q. That was done by a system of valves?

A. No, sir, by simply putting the gas into that district holder after midnight and then holding it there until noon of the next day when our demand became strong, and then furnishing those people in East Lincoln from that holder, and then the amount of gas that was used from the holder of course did not have to come through the mains in the business section of the town, so the relief that was obtained was beneficial to everyone else. I might say that we were delivering, I will presume '25,000' cubic feet of gas per hour to East Lincoln over our peak load, when we put in that holder we just took that '25,000' feet out of the mains down here and improved the pressure in those mains proportionately."

1816 On Going Value—Mr. Lea's Method.

Mr. L. E. WETTLING:

"A. It is a method that has been approved by a great many engineers, and I have hear- it brought forth a large number of times and it is a much more specific method than the one most ordinarily used of lumping the matter either by taking the foregone dividends for the whole period and calculating them and sometimes even com-

pounding interest up to date, or taking the cost of acquiring patronage or consumers or business with a certain limit of cost and applying that to the number of consumers or the number of years. There are a great many methods used, but I think the most approved method, the one while it is theoretical, accords thoroughly with the practice, and that is the plan which Mr. Lea has applied, his schedule of going concern value.

Q. Would you say that it is scientific and ac-urate?

A. As nearly as may be projected; I assume it is not possible to get it absolutely accurate; no more possible than it is to determine in advance the exact life of any particular equipment that rests in estimate about the same way." (4083.)

1817 *On Behalf of Defendant.*

1818 On Going Value.

Mr. E. C. HURD (4269-71):

"From my knowledge of this property here and its being in successful operation and assuming that Mr. Lea's figures of cost are correct, this is an approved method that is used and accepted in estimating going value and what the going worth in a plant is over and above its physical factors of cost and represents what a man might pay for the property in addition to its physical known investment because of being a going concern." (4276.)

1819 On Going Value.

ALTON D. ADAMS (3438):

"Of course, to get down to the details of such a computation we have got to consider the amount of plant necessary to do the business, the fixed charges on that plant in the way of interest and depreciation, the ordinary running expense, * * * cost of material to manufacture the product, and * * * the very important element of time, estimating as best we may * * * on the best experience we can get from what has happened elsewhere as to the time in which a given amount of business may be built up." (3451.)

1820 Overhead Charges.

Mr. E. C. HURD:

"A. Well, I would say if you had every other item accurate and that you had the exact amount of money which you had expended that you would find a difference of at least 4% probably; in other words, you would add 4% to your fundamental items to cover this at least; it might be more than that, it may be less than that, but that would be a reasonable amount." (4099.)

Engineering Cost.

Mr. E. C. HURD:

"A. If it is a question of reproducing this plant there is no question whether taking all things into consideration it is presumed that the promoters would at least seek expert engineering advice to design and make a study of the filed as to the economical location of the producing plant, the trackage facilities, the location of the mains and all those things together with the actual construction design. And of course later supervision of the structural portion of the plant as it was placed, and I should say that a r-asonable amount would run from 5 to 10 %, depending on how earnest the promoters were and how well placed the plant they might have designed, * * * I should say it would be money well spent." (4100-4101.)

1821 Working Capital.

Mr. ALTON D. ADAMS:

Q. "If you were valuing Miller & Paine's store and they had outstanding in bill- receivable $100,000, would you regard that as a part of the investment in that business?
A. No, I wouldn't." (3694.)

1822 Working Capital.

Mr. WETTLING:

Q. "And it is necessary to keep stores for repairs and replacements of plant in advance?
A. Necessarily, and also if you- business is being carried on as is usual and customary for gas companies all over the country, it is also necessary to keep appliances, stoves and supplies of that nature on hand; and you are obliged to keep on hand a considerable number of meters, depending on the ratio of growth, but you must necessarily have some in stock because if a customer comes today and says he is ready to take gas tomorrow, you can't wait to send down East and bring it back or he may forget that he wanted to use gas." (4084.)

1823 ALTON D. ADAMS:

Q. "If you think they haven't time down in Massachusetts to see that those companies make proper reports as to the money expended for repairs and renewals, or expended for expenses, do you think they have time to check over and determine whether the *ti*ems expended for the operation of the plant are properly entered and applied under the classification they assumed to apply them under?
A. Not generally by any means. * * *
Q. It is left very largely to the company to make up its own report about in its own way, except that it must fill out the standard form?

A. The Company does, as a matter of fact, exercise a good deal of discretion in making out its report; there is no doubt about that." (4394-5.)

1824 ALTON D. ADAMS:

Q. What experience, if any, did you ever have in the manufacture of gas such as this company furnished here?

A. Why, I have watched and analyzed." (3529.)

1825 Mr. A. D. ADAMS:

Q. Of course, you feel that the city is your client in this matter?

A. I certainly do.

Q. That you are in the service of the city and you represent the city in this controversy, and that you are giving the city the best service you can?

A. Yes, sir.

Q. And in its interest?

A. Yes, sir.

Q. But you do not feel free to volunteer information or opinions or judgments to this company for its benefit in this controversy?

A. I do not think I am called upon to do that; no, sir.

Q. Especially in view of the fact that you have participated in pursuing a vigorous cross examination of witnesses you would hardly be expected to turn around the next day and render assistance, even though you felt that the facts if fully disclosed would be to the benefit of the company?

A. Well, I haven't considered any facts that I thought were necessary to the company, if that is what you are driving at." (4409.)

1826 Mr. A. D. ADAMS:

Q. Did you make any estimate before Mr. Lea testified and furnished his report?

A. Why, no sir; no direct estimate of my own, I looked at the estimates your men made in the case in the United States Court and did a little thinking about that, but I didn't make an estimate of my own." (3694.)

1827 Mr. A. D. ADAMS:

Q. You *cal*im you have qualified yourself and are competent to testify as to the value of real estate in this city?

A. Not generally over the city; no, sir.

Q. But of this particular real estate—the real estate of the company?

A. Yes, that is my view, sir.

Q. And in qualifying yourself for that service what sources of information did you seek?

A. The information derived from observation and of the district down there in that part of the city, and derived from a number of

sales which were collected and arranged according to my request, sales in the vicinity of the land.

Q. Did you go back of the deeds to learn what the consideration was?

A. I took the consideration as stated on the face of the deeds.

Q. Did you inquire of the people who owned the property that was conveyed; what the real consideration was?

A. No, I simply went on the face of the deeds and on my judgment.

Q. Did you think it desirable to inquire of men who are engaged in the business of buying and selling real estate in the city to inform yourself as to the value of such property?

A. I did not. (3615-3620.)

1828 Mr. PERRY HAHN:

Q. Did you ever have any actual experience on a job of putting up a building?

A. I say I did; yes, a great many.

Q. I don't mean putting them on paper; I mean helping put them up?

A. No, I never helped to put up a building.

1829 Mr. HAHN:

Q. "What buildings have you constructed in this locality?

A. Well, I had the brick work on the Orphanage Home out here for Bishop Bonacum, and the Missouri Pacific depot and the Burlington freight house—oh, I guess I could name seventy-five buildings in town if you want them.

Q. It has been your business to know something of the cost of putting up buildings?

A. Yes, sir.

Q. And the cost of brick and the labor entering into the construction of the buildings?

A. Yes, sir.

Q. What you had to pay for it?

A. Yes, sir.

Q. And your knowledge along that line is not altogether theoretical?

A. No, sir" (3182-3214).

1830 B. C. ADAMS:

Q. "What was the occasion for the erection of the district holder at 33d and X?

A. That was located in East Lincoln for the purpose of giving our customers in that territory service and to aid us in giving the customers in south Lincoln and other parts of the city better service (1468).

A. We made an effort to discover just what we could do at that time to enable us to give the consumers who were getting a low

pressure a better pressure and made a detailed study of the entire system at that time to find out the most economical thing to do as a temporary makeshift.

Q. Where the pressure falls below one inch and is as low as .8 of an inch, as id did at 30th and R streets and such instances as you have noted, what would you say then as to its efficiency?

A. That is a very low pressure for the consumers to use gas under and causes complaint and dissatisfaction and high bills (1469).

Q. When the pressure gets to .8 of an inch it is getting so low that the gas might go out entirely and when the gas pressure comes up again the gas escapes unknown to the inhabitants and death may result (1473)?

A. We adopted the notion of putting in a temporary booster at 9th and M for the purpose of taking the gas from the mains at a pressure of 14.4 inches and forcing that at 9th and M to 18th, and from 18th to R through the main feeder to that northeast district and shutting the valve going south, so it wouldn't get into the south part of the town under high pressure; we reported that to New York; that was our recommendation for a temporary makeshift for the purpose of avoiding the expenditure of $10,000 or $12,000 in improvements at that time, which would give us temporary relief, and that some other scheme would have to be provided later.

A. We were unfortunate in buying our blower and dug a pit at 9th and M and got the blower in there and found that the manufacturers had sent a sieve instead of a blower and we were unable to use it. We had a hard time that winter doing anything for those people in that part of the town. The next year we took the matter up with Doherty & Co. as to what we ought to do to take care of this district; it was then that we finally adopted the district holder system scheme. I remember that I was talking with Mr. Scott, the general manager of the Doherty Operating Company, about the situation and he suggested to me that they had used the district holder in Denver, and when Mr. Bradford and I got to working out the situation in northeast Lincoln we finally recommended a district holder to Mr. Scott and he heartily approved of it.

Q. Was there any other purpose in suggesting the district holder except to relieve the conditions out there?

A. You might get at that this way (1475), Mr. Bradford and I, before we made our recommendation, went carefully over other schemes for getting at the situation. We went at two other schemes —one was to rush a high pressure main out to the northeast district; the other to segregate and connect up a district governor and put in a gate and connect up a district governor and put in a bigger field from the plant or some other part of the system. We abandoned both of these schemes, because they were not practical under the Lincoln conditions, and the city council was constantly agitating the company in regard to high pressure and the delivery to their mains, and threatened us with lawsuits, and the water commissioners reported every month that the pressure exceeded the limit required by the ordinance; and Mr. Bradford and myself thought it absolutely

impracticable and perhaps impossible under our situation to talk about any other scheme than a district holder for meeting that situation.

Q. Now, what problem had you encountered in selecting a particular location?

1831 Mr. B. C. ADAMS:

A. That problem resolved itself into this: What pressure could we deliver from our plant and how far could we carry it into northeast Lincoln with what I would call a low pressure system (1476)? I regard a low pressure system as any that delivers gas with a centrifugal blower. We wanted to stay with a low pressure system that you could throw the gas into northeast Lincoln and give service at the farthest point. When you get into a positive blower you get into high pressure. Then we thought the safest and best thing for us to do was to get a district holder as far out as we could to bring the gas back; we figured that Lincoln would eventually grow east of 33d and south and that the district would grow up and around from 27th to 33d and Holdrege and further north and west, and if we could get our holder around 33d and the Missouri Pacific or somewhere along there we would have the holder property properly located. We figured that the ordinary pressure of the holder would bring the gas back into Lincoln and overlap with the gas that was coming from the plant holder.

Q. The pressure from the plant holder and the district holder would meet at a point where you could equalize the pressure midway between them (1477)?

A. Yes, sir, and also just put the holders far enough out so we could get into it during the hours of light load. We might put the holder out so far that the gas would not feed into it during the hours of light load on account of the drop in pressure.

Q. And in the actual experience have you found that the particular location met the problems that faced you?

A. Yes, absolutely.

Q. Do you now regard that the location of that holder was unavoidable in view of the conditions existing in Lincoln at the time?

A. Yes, sir.

Q. Was it put there to meet those conditions?

A. Yes, sir.

Q. Did you encounter any difficulty in carrying out that plan from the municipality and property owners?

A. Yes, sir (1477).

Q. Detail what they were; explain in a general way what they were and what the results of your negotiations were and how you came to buy all that property in blocks 2 and 7?

A. After our estimates were all made for the erection of that holder we discovered that the city council was going to offer objection to the erection without a permit. We appeared before the council and asked a permit, even though we were advised that it might not be necessary, and the council appointed a committee to take the

matter up with the company and we had our price on our holder with a steel tank, and the council committee insisted on our digging a pit at a very considerable more expense than the steel tank. It was also intimated to me personally by the committee that unless we were able to satisfy Mr. Hill, who owned a house and some lots adjacent to the holder that perhaps we might have some difficulty in getting a permit. Mr. Hill was the janitor at that time at the High School and rather than have any difficulty over that matter, we paid Mr. Hill his price for the property and the permit was later granted.

Q. Did you regard that expense as reasonably necessary to retain your right to locate there?

A. Yes, sir; we had to do it under the conditions (1478).

Q. Did you get the permit until after you agreed to that?

A. No.

Q. After you had purchased the property did you get the permit?

A. Yes, sir.

1832 Mr. B. C. ADAMS:

Q. In your opinion, as I understand you, you regard his position and his claim that his property would be damaged would be sufficiently influential with the council so they wouldn't grant the permit until you satisfied his damage satisfactorily to him?

A. Yes, sir. (1479)."

Mr. WETTING:

Q. Were you acquainted with the conditions which led to the construction and putting in service the district holder?

A. Yes, I was in a general way, from conference with the manager and talks generally that preceded the determination to build that holder. There had been a great deal of complaint, well founded as acknowledged by the company, of a lack of pressure pretty much all over town, but more particularly in the northeast part of the town at certain periods of the day; it was almost impossible in 1904 and 1905, as I remember, to get a pressure on the gas stoves. I was living on the east side myself and happen to know personally of the conditions, and by reason of investigating it on the complaint of my wife; the complaint was pretty general and the question arose as to how to correct the trouble. While the complaint was not so definite nor strong from the south and southeast end of the town, yet there was some complaint in that direction also, and it was determined to relieve it. Relief was obtained by tying in the mains so as to get a better circulation, but it was determined that it was necessary to do one of two things, either to build much heavier mains in all directions from the gas plant or to build a separate holder on the East side, which would take care of the northeast—the development of the northeast territory independently and at the same time relieve the plant from the demand on it for that section to the southeast section and in that way the southeast as well as the northeast section would be relieved; and the general opinion was

that in the long run it would be cheaper and less expensive operation to build the holder than to try to correct the main situation; that was assuming, too, that provision would in the future again have to be made for still further enlargement or extension by reason of the anticipated growth." (4088-89).

1833 Mr. CAMPEN:

Q. In the matter of granting a permit for the location of a main in the street, as I understand you, that was within the duties of your office?

A. Yes; well, as to the position in the street, the position in the street is governed by an ordinance.

Q. Was there any rule of your department or any ordinance of the city the fixed the location of the gas mains in the street?

A. There was, and there is today, if it hasn't been repealed.

Q. Where is that main required to be located with reference to the curb line?

A. They located the gas main one-third of the width of the street from the south and west line, as I remember it, and the water works one-third of the distance from the north and east line.

Q. So that the gas mains were given one side of the street and the water mains the other?

A. Yes, sir.

Q. And in both instances the mains were required to be located in the street?

A. Yes, sir. (1297).

1834 Mr. CAMPEN:

Q. In other words, you have not assumed in mains now laid under paving could be duplicated by laying the mains parallel thereto in the park way in the unpaved part of the street?

A. We couldn't do it without changing the law.

Q. You haven't assumed that it would be done then in your estimates?

A. No sir, it couldn't be done; it is impossible (1316).

Q. Now what price per square yard have you figured here in Lincoln for laying the paving that may have to be removed or a duplication of this, what price for each kind of paving per square yard?

A. The specified price for brick on concrete at $1.25 per square yard. I took the average—that is, knowing the conditions here in Lincoln up to say 1906, and knowing that the concrete runs in repaved streets from 5 to 12 and in some places 14 inches, I have taken $1.90 as the average. * * *

A. I think on an 18 inch ditch you should have 26 inches wide of concrete. * * * (1318-20).

1835 Mr. A. D. ADAMS:

"Q. Did you make any inquiry at the gas office or of the foreman in charge of the work of putting in gas mains to ascertain from

him whether it was an 18 inch trench or a 22 inch or a 24 inch trench?

A. No, but I measured at least one gas trench, I am not sure whether I talked with your superintendent of construction or not, if I did I have forgotten what he said.

Q. He would be the party who knew from actual experience?

A. I was too when I laid the rule across the trench.

Q. Where was the trench and when was it?

A. One of the early day- I was here.

Q. Now what year was it, I want to know and where was it?

A. You can't find out because the witness don't know.

Q. You don't know when or where it was?

A. No, except that it was in the early part of the time of my being here, I can't tell the date or where.

Q. Is there anything in the gas company's record that shows anything about the width of the trenches?

A. I haven't found it. (3737-3738).

Q. So you went out and measured one ditch and found the width and depth; did it have any pipe in it?

A. Yes, 2 inch pipe."

1836 Mr. A. D. ADAMS:

Q. "How many cubic yards did you figure one man would dig?

A. I didn't figure that out.

Q. Would it be possible for you to estimate how much a man could move in a day?

A. I could if you didn't work me all the time day and night.

Q. Have you any information now on that.

A. No, sir. (3671).

Q. Is there any difference in the cost of removing dirt from trenches in Massachusetts and the cost here?

A. In some places in Massachusetts, yes; other places, no; there is a different rate in Massachusetts, and we do differently there.

Q. You have got to know the local conditions, the kind of soil that must be moved and the conditions under which it is to be moved before you can form an intelligent estimate of the cost?

A. Yes, before you can form an accurate idea. (3660-61).

Q. Did you inquire of any of the men living in this vicinity as to the cost of removing dirt from trenches or basements before you made your estimate?

A. No, I preferred to go to the figures and not go around and ask people on the streets.

Q. You didn't seek that source of information?

A. No, I didn't think it reliable. (3668)."

1837 Mr. A. D. ADAMS:

Q. Was the price of pipe per ton in 1902 more than it was in 1912?

A. I can't say without looking up my records.

Q. Well, look at your records, you have them here, the price to this company here per ton?

A. Well, I have one purchase of pipe in 1902, that wouldn't necessarily represent the whole year, but taking that one purchase in June, it shows the price of $33.60 per ton.

Q. But for that pipe in your estmate you allowed $28.00 per ton for that same pipe?

A. Yes, I allowed $28.00.

Q. Now, in 1903, as shown by the records of the company, what did the company pay for pipe per ton?

A. I have just one record given for 1903, on March 26, they bought 4 inch pipe at $36.60; that is all I got for the year.

Q. And for that pipe you allowed the company $28.00 a ton for the purchase of it?

A. Yes, sir.

Q. Notwithstanding the fact that you knew they paid $36.60 per ton for that pipe?

A. Oh, yes, back in 1903; I am not valuing the property as of 1903.

Q. What did the company pay for pipe in 1905?

A. $36.60 on the one purchase that I have.

Q. But you allow $28.00 for the purchase of that pipe as of January 1, 1913?

A. As of January 1, 1913, yes.

Q. In 1906 what did the company pay?

A. I have three purchases showing $32.35 per ton of a small amount.

Q. And as against that you allow $26.00, don't you?

A. Yes, I think that way my price.

Q. That would be for the purchase of pipe January 1, 1913, to take the place of this identical pipe that the Company paid $32.35 per ton for in 1906?

A. I am estimating the cost of reproducing such pipe January 1, 1913.

Q. If you are estimating the cost of reproducing it as of January 1, 1913, why don't you take the bills of the company for the purchase of pipe under date of January 17, 1913?

A. In the first place I have no knowledge of the time I ever saw that bill and in the second place I should not consider that one transaction a criterion to go by in the purchase of enough pipe to replace this great gas system.

Q. You find in that one transaction a purchase of more than $1,000.00 worth of pipe under date of January 17, 1913, don't you?

A. The two accounts do figure just over $1,000.00.

Q. Do you think the purchase of $1,000.00 worth of pipe under date of January 17, 1913, wouldn't be a fair indication to the Court what pipe would cost?

A. Absolutely not. When bought in quantities necessary to reproduce this system.

Q. Well, Mr. Lea estimated the value of 4 inch pipe at $32.00 and this bill shows that 4 inch pipe cost $31.55 on January 17, 1913, doesn't it?

A. Yes, I just testified to that a moment ago." (3760.)

1838 Mr. A. D. ADAMS:

"Q. You have indiacted that you thought the commission knew of this practice that you referred to as existing in Massachusetts?

A. I know they know; it is brought up repeatedly in the hearing there, there is no 'think' about it, it is just as well known as any practice could be, and the commission can't help it.

Q. The- can't help it?

A. No, sir.

Q. They cannot change or direct that item to be entered as it should be entered in the returns to the commission?

A. The trouble would be that it would require an army of accountants and engineers to chase up the fifty companies to see what they entered as repairs or as renewals was in fact an extension; it is the practical enforcement of a regulation of that kind, on a matter involving as much judgment, engineering and skilled judgment as that does, that makes it impossible and impracticable for the commission to enforce a rule on that matter (4393).

Q. Now if you think they haven't the time down there in Massachusetts to see that those companies make a proper report as to whether the money expended is for repairs and renewals or expended for extensions, do you think they have sufficient time to check over and determine whether the items expended for operation of the plant are properly entered and applied?

A. * * * Not generally by any means. * * * (4394.)

Q. Now you referred to the matter of repairs and renewals in Massachusetts and said that some of the companies in Massachusetts were in the habit of covering up their earnings by entering as renewals or repairs what were in fact extensions, I think you said that?

A. Well, that maybe a fair summary of what I said.

Q. Now do you think the Commission in Massachusetts knows that that is being done?

A. Oh, it is notorious." (4391-4392.)

1839 Mr. A. D. ADAMS:

Q. Now take the items of salaries, office, distribution and general expenses for the years 1907 to 1912 inclusive; now, for the year 1907 you have offered a tabulation showing that the amount of salaries, etc., should have been $24,214.41?

A. Yes.

Q. Now will you refer to the records of the company that we have here and show the items going to make up the amount entered in the record covering those items for expense for 1907?

A. Reading meters $952.10; collection, clerical salaries $5,355.20, etc., etc.

Q. Now, that is the total as shown by the records, $36,912.39?

A. Yes, for those various items mentioned.

Q. And as against that amount you have allowed for those items the sum of $24,214.41?

A. I have allowed $24,214.41 in 1907 for the estimate of salaries, office, distribution and general expenses.

Q. So that the difference, you eliminated from those items $12,698.48?

A. I didn't subtract the difference, but it is the difference between them. (3932.)

Q. Now, refer to the items as shown in the records of the company and state what particular items in that exhibit of the records of the company you reduced, eliminated or in any way changed?

A. As previously testified I am not able to make the reduction item by item from my study so far of these accounts—I haven't carried the study of the actual labor you charged under those items to a sufficient extent as to be able to do that. Of course, the item of promoting new business of $13,394.04 it looks to me would suffer a large reduction, but I am not going to testify what reduction I would make without further study, because I don't know enough about what you charged under that.

Q. Take just the single item of reading meters—do you think that item of $952.10 is excessive?

A. No, I don't think it is excessive.

Q. Now take the collections, clerical salaries—do you know about how many clerks they have in the service?

A. I don't know the number.

Q. Did you ever know?

A. I don't remember.

Q. Would the number of clerks necessary to transact the business have anything to do with that item? (3933.)

A. To transact the business of selling gas and get the money would have a good deal to do with it, but the number of clerks you have to sell appliances wouldn't have anything to do with it.

Q. Have you any idea whether that item of over $5,000 is excessive?

A. No, I haven't any precise idea, because I don't know what services were performed for that $5,353.20 what you have got charged and how much should be charged some *under* item. (3934.)

Q. Collections, office expense $770.14. Did you notice that?

A. It may be entirely unnecessary in view of the $5,000.00 that just precedes it.

Q. But you don't know whether it is or not?

A. No.

Q. And you haven't any opinion on it at all?

A. No, sir; that is all this answer amounts to.

Q. The item of executive salaries of $3,215.52, you wouldn't be able to offer any criticism upon that item or approve it because you wouldn't know what would be included in that item?

A. I wouldn't know what the value was the company received for that $3,000, if any. (3942.) * * *

1840 Q. So you prefer to criticise the whole account rather than put your finger down on any one thing?

A. On that section of the account, general office, yes," (3952). * * *

Q. Now, for the years 1908, 9, 10, and 11, you pursued the same course as in 1907 in the classification of the account of this company?

A. I pursued the indicated classification right through. (3961.)

Q. And your criticism with reference to those accounts of those years would be the same as in 1907?

A. The same in kind.

Q. And your knowledge about the particular items of each of those accounts for those years would be the same in kind as the accounts of 1907?

A. Yes, sir.

Q. Now take the accounts of salaries, office, distribution and general expenses for 1912, you have eliminated something like $44,818.67 for those accounts, haven't you?

A. I don't remember the amount, my estimate differs from your statement. (3964.) * * *

Q. Do you think that any part or portion of the 250 million feet we are selling now is due to the money expended in the new business department?

A. I would have to make the same answer, I think it is an evidence of it, I never suggested that I didn't think so.

Q. You think it was?

A. I think it was a factor, yes.

Q. Do you know what proportion of that increase would be attributed to the money spent by this company in its new business department?

A. No, I don't.

Q. Is there any way you can estimate the amount of that increase that you would attribute to the money spent in the new business department?

A. I could arrive at a rough estimate, but I haven't. (3971.)

Q. If you go back to the time we had 80 millions of gas would it increase the cost of gas per thousand if you had to base your computation on the sale of 80 millions?

A. Yes sir."

1841 Mr. H. S. WIGGINS:

"Q. Now you have had access to the books, records and vouchers of the gas company practically since last September, have you not?

A. I did some work since last October, I think for about ten days.

Q. And at intervals since then you have applied to the company for access to its books and records?

A. Yes, sir.

Q. And you have been given fair access consistent with the convenience of the company in administering its own business?

A. Yes, sir.

Q. Now, from your examination of the books would you say that the methods of accounting of the company seem to be fairly accurate and conscientious?

A. Yes sir.

Q. So far as your examination shows the company has attempted at least to keep an honest and fair record of its business transactions?

A. So far as my examination goes, I would say so.

Q. And after checking those out you would feel justified in relying upon the general summary, exhibiting the business in summarized form?

A. Yes I think so." (Pr. R. 337-338.)

Q. And you found that the books of the company were accurate and disclosed that they were honestly kept, didn't you?

A. Well, I couldn't say that I found anything to the contrary.

Q. You found an honest effort made on the part of the company to keep a correct record of the cost and expenditures of the company?

A. Well, yes." * * * (2044.)

1842 Mr. A. D. ADAMS:

"Q. Is there any standard recognized by engineers as to the normal life of equipment such as is found here?

A. I haven't been able to discover any uniformity in that regard.

Q. The engineers don't agree?

A. I think that is true.

Q. Some engineers don't even agree with themselves?

A. That might be true, a conscientious engineer sometimes changes his opinion.

Q. And the oftener he changes his opinion the greater the indication that he is conscientious?

A. I should want to know all the facts in regard to that.

Q. Suppose a gentleman who is an expert testified in Racine, Wisconsin, and gave the life of equipment materially different from what he had given it here, and also testified in Cedar Rapids, Iowa, and gave the life of the same equipment as this different from the life he gave for this equipment, would you assume that to be an indication of conscientiousness?

A. It might or might not be; I should have to know more of the facts." (3712.)

1843 On Going Value.

Mr. HURD:

"Q. Assuming that the rate were to be reduced to $1.00, would it make any difference in the computation, that is, in the net results obtained as to the value of the item 'going concern'?

A. Well, I should say it might, it would be introducing a new factor into the equation; yes, sir.

Q. That the rate of return is an essential element in this computation, there is no question?

A. Yes, sir, it is the vital element.

Q. So that if you take the rate in force at the present time and the rate which is sought to be enforced by the City, and make a computation with the two different rates you would arrive at two different results?

A. Most assuredly, because you would have different factors entering into the tabulation. That might be exemplified if you had a losing concern, at present it was losing money, you would have a

very different result in the going value than you would have if it was a profitable one, or a concern that was running on a profitable basis.

Q. So that in that case you would get a different value for 'going concern'?

A. Yes, sir.

Q. That is, in each instance?

A. Yes, sir."

1844 On Weights of Cast Iron Pipe.

Mr. GEORGE L. CAMPEN:

"Q. Why did you select those weights?

A. I took them from the United States Cast Iron Foundry Company's standard, their latest catalogue gotten out about the 1st of December.

Q. Those are the weights of the United States Cast Iron Pipe Company, given in their regular catalogue for regular standard cast pipe?

A. That is the one I saw.

Q. What reason have you to think, if any, that this weight of pipe shown in the listed catalogue of the United States Company are weights that actually exist in the streets of Lincoln for carrying gas?

A. Oh, I think they are about the average; the fact is, the pipe company used to skin up all companies by overmarked weights, unless you weighed the pipe you had to pay for it. On a 300 or 400 ton order we saved 19 tons by reweighing it. In the old days they used to sell it and marked it up 5 or 10 per cent above the costs; it would make no difference what they marked on there, unless you weighed the pipe."

"Q. You say you were asked to take the standard weight at this time of pipe?

A. In getting the reproduction cost, how would I take it any other way?

Q. I say you were asked to do that?

A. Yes, sir.

Q. And that is the basis you went on without regard to the weight of the pipe in the ground?

A. I have no means of knowing that they are not practically the same; there has been no difference between them in the last few years practically (p. 1329).

Q. You did't figure that on the reproduction of the actual pipe in the ground at all, but simply to lay the present weight of standard pipe of certain lengths?

A. Yes, sir"( p. 1331).

1845 On Meter Connections.

Mr. BAXTER:

"Q. What style of meter connections are you using now on small meters?
A. Rigid connections.
Q. Rigid pipe connections?
A. Yes, sir.
Q. Has that been the rule all of the time since you have been in charge of that work?
A. I think it has.
Q. Well, you people have been about a great deal with meters. Take the meters installed prior to the time you had charge of the work—what was the general style of connections used?
A. Well, I am not exactly sure when the solid connections were started, but before that time all connections were lead.
Q. Do you remember anything about the ordinary size and length of those lead connections as you used them here?
A. Well, they run about fifteen or eighteen inches. I am not sure exactly just how long they were.
Q. For a five-light meter, say?
A. That is about it.
Q. As long as that for a five light meter?
A. Yes sir."

1846 On Coal Gas Benches.

Mr. HONEYWELL:

(P. 151, Pr. R.)
"I cannot tell you how many time- those arches have been rebuilt, or how many times those benches were rebuilt, but we built the arches and refilled them last year."

1847 Mr. PHILLIPS:

(P. 1700.)
"Q. Then what is the system of keeping up the plant, the replacing of old apparatus with new, taking out a section of main that has become defective and cannot be used and putting in a new section, and taking out an old water gas set and putting in a new, the expense has either been added to your construction account or entered in your operating expense under the items of 'repairs and maintenance'?
A. Yes, sir, it has to go into one of the two places.
Q. And sometimes, as you have said, part of the item is entered in each account?
A. Yes, sir.
Q. And that is the way the company has kept up its plant and kept an efficient and working plant in times past?
A. Yes, sir.

Q. And what is the present condition of the plant, is it in good condition or has it been allowed to run down and deteriorate?

A. As far as I know it is in good condition. I am not an engineer and do not know much about that end of it.

Q. But such condition as we now find it in, and you say it is in good condition, has been maintained in the manner you have outlined there by adding new articles of construction and entering it in your construction account and adding it to the assets or adding it into current expense?

A. Yes, sir.

Q. Then in your opinion has the amount and sums expended by the company since this present management took charge of it been sufficient to maintain the value of the plant and keep the investment unimpaired?

A. It has.

Q. That is the method employed by this company to take care of depreciation and keep the plant from depreciating and running down?

A. Yes, sir, we call it that."

1848 On Office Rent.

Mr. B. C. ADAMS:

(P. 1485.)

"Q. Mr. Adams, the item of office furniture is carried on your books and inventory at what valuation?

A. $12,391.21.

Q. And the same item is carried on the books at a valuation of what in 1901?

A. Well, it wouldn't be the same item. The same heading was carried at $240.00.

Q. In other words, you had your office furniture valued November 30, 1901, and entered on your books at a valuation of $240.00?

A. Yes, sir.

Q. Whereas, you have it now $12,391.21?

A. Yes, sir."

1849 On Loss on Appliances.

B. C. ADAMS:

(P. 1493.)

"Q. Isn't it a fact that your annual report ending December 31, 1912, shows a total loss on gas appliances along of $7,301.93, or thereabouts?

A. I don't remember; I could tell by looking at the report.

Q. What do you recognize from this report? (Handing paper to witness.)

A. Referring to the copy of the report handed to me, are the totals for advertising and newspaper space, exhibition, salaries, wages

and miscellaneous expenses, and then adding the cost of appliances sold to the appliance expense and from that getting the total cost of the appliances, I find for the year represented in this sheet $7,301.93.

Q. And that is a loss that is reflected in the operating expenses of this company for that year, is it not?

A. Yes, sir."

1850 Professor BEMIS:

(P. 362 Pr. R.)

"I have studies the effect in scores of companies, that is, I have studies the effect in every company in Massachusetts in the last twenty years where I have had an opportunity in their files to study it, the files of the gas commission. * * *

Ordinarily the year after the reduction made the profits are found not to have fallen, not over one-half of what one would have expected from the basis of the previous year's business. That is, suppose a reduction were made in 1908, the net earnings of 1909 have not fallen more than one-half as much as you would expect from the conditions of business in 1907, because there is such an increase in output from the reduction in price, usually without a corresponding increase of expense. * * *

I found the general result was that a decrease of 20 cents would mean a decrease in net earnings only from 10 to 15 cents per thousand feet in the following year.

(P. 390.)

What I have observed was that a decline of 20 cents in price would generally mean a decline in profits of not over 15 cents, owing to the large increase in business; and the second year it would be a decline of not over 10 cents usually. * * * It is not a precise mathematical rule; it would depend upon the energy of the company in following it up."

1851 Franchise Value.

Mr. H. I. LEA (p. 221):

"There isn't any franchise value. Whether the company has a franchise or not there is no value to the franchise, that should be included in determining the value of the property as a whole, unless the Company has actually paid a specific sum for a franchise, and I know of no such payment having been made here for a franchise."

1852 In the District Court of the United States for the District of Nebraska, Lincoln Division.

THE LINCOLN GAS & ELECTRIC LIGHT COMPANY, a Corporation, Plaintiff,

vs.

THE CITY OF LINCOLN, NEBRASKA, et al., Defendants.

*Condensed Statement of the Evidence.*

Appearances:

For Plaintiff: E. C. Strode, Esq., and H. F. Rose, Esq.

For Defendants: C. Petrus Peterson, Esq., City Attorney, W. M. Morning, Esq., Special Counsel.

It is stipulated and agreed between the parties hereto that the foregoing condensed statement of the evidence with all exhibits material to the issues in the case, including all objections to the evidence and rulings thereon is a true, complete and properly prepared condensed statement of such evidence including all such exhibits, objections and rulings, and it is agreed that the same may be settled and allowed by the court or the judge thereof as a true, complete and properly prepared condensed statement of all of the evidence and all of the exhibits material to the issues in the case and all of the objections and rulings thereon filed with the clerk of the court in the above entitled cause as a part of the record in this case and in full compliance with rule 75 of equity rules of the court.

It is further stipulated and agreed that the original exhibits are to be used on appeal and are to be made a part of the record, so that copies need not be made thereof on such appeal and that in the preparation of the printed record by the clerk of the court such exhibits are to be used in all respects the same as copies thereof, and that an order of the court may be entered herein in accordance therewith by and with the consent of the parties hereto.

Dated this 11th day of August, 1916.

E. C. STRODE,
*Attorneys for Plaintiff.*
C. PETRUS PETERSON,
W. M. MORNING,
*Attorneys for Defendants.*

1853 I hereby certify that the statement of the evidence hereto attached, consisting of one volume, and the exhibits material to the issues, consisting of volumes 1, 2, and 3, in each of which a copy of this certificate is attached and likewise signed and allowed and including certain testimony reproduced in the exact words of the witnesses, desired by the parties and ordered to be so set out by the

court; the objections to the evidence and the rulings of the court thereon as set out herein, and including the stipulations of counsel, is a true, complete and properly prepared condensed statement of such evidence, stipulations, exhibits, and objections and rulings of the court thereon, properly prepared and submitted, and that the same is hereby signed, settled and allowed, and ordered made a part of the record in the above entitled case under the provisions of Rule 75 of said court, as a true, complete and properly prepared condensed statement of all the evidence upon said trial.

Witness my hand this 12th day of August, 1916.

PAGE MORRIS, *Judge.*

1 In the District Court of the United States District of Nebraska, Lincoln Division.

LINCOLN GAS & ELECTRIC LIGHT COMPANY, a Corporation, Plaintiff,

vs.

THE CITY OF LINCOLN et al., Defendants.

*Stipulation.*

It is hereby stipulated and agreed that the clerk of the court in the preparation of the printed record on appeal of this case shall omit therefrom two exhibits 11 referring to meters, found in this volume, for the reason that the matters contained in such exhibits are fully covered by the testimony of witnesses or other exhibits, or are deemed by the parties hereto immaterial under the issues on this appeal.

E. C. STRODE,
*Attorneys for Plaintiffs.*
W. M. MORNING,
ANDREW PETERSON,
*Attorneys for Defendants.*

2 This is one of seven volumes of evidence taken before me at the trial of the case of Lincoln Gas and Electric Light Company vs. City of Lincoln, et al., pending in the United States District Court, for the District of Nebraska, Lincoln Division. These volumes, together with the original printed record containing the evidence given on the first trial and certified to the Supreme Court of the United States, constitute the whole of the evidence submitted to me, and upon which my report heretofore filed in this case is based.

JOHN J. SULLIVAN,
*Special Master.*

3 *Certificate.*

I hereby certify that the statement of the evidence hereto attached, consisting of one volume, and the exhibits material to the issues, consisting of volumes 1, 2 and 3, in each of which a copy of this certificate is attached and likewise signed and allowed, and including certain testimony reproduced in the exact words of the witnesses, desired by the parties and ordered to be so set out by the court; the objections to the evidence and the rulings of the court thereon as set out herein, and including the stipulations of counsel, is a true, complete and properly prepared condensed statement of such evidence, stipulations, exhibits, and objections and rulings of the court thereon, properly prepared and submitted, and that the same is hereby signed, settled and allowed, and ordered made a part of the record in the above entitled case under the provisions of Rule 75 of said court, as a true, complete and properly prepared condensed statement of all the evidence upon said trial.

Witness my hand this 12th day of August, 1916.

PAGE MORRIS, *Judge.*

4 Henry I. Lea, Consulting Gas Engineer.

Member American Gas Institute, American Society of Mechanical Engineers.

People's Gas Building.

CHICAGO, March 13th, 1913.

Lincoln Gas & Electric Light Co., Lincoln, Nebraska.

GENTLEMEN: In accord with your instructions, I have made an examination of the property and business of your Gas Department and of the operating expenses and income of that Department, for the purpose of determining the present value of such property and business.

I am now able to report that, in my judgment, the present costs of reproduction and the present value of the property and business of your Gas Department, are fairly shown in the table following:

| (As of Jan. 1st, 1913.) | Reproduction costs. | Present value. |
|---|---|---|
| Organization & Legal Expense..... | $33,000.00 | $33,000.00 |
| Working Capital ..... | 72,038.00 | 72,038.00 |
| Real Estate ..... | 21,700.00 | 21,700.00 |
| Buildings ..... | 41,312.00 | 30,967.00 |
| Works Equipment ..... | 253,298.00 | 196,759.00 |
| Distribution System ..... | 659,727.00 | 553,650.00 |
| Going Value ..... | 225,000.00 | 225,000.00 |
| Total..... | $1,306,075.00 | $1,133,114.00 |

In the form of Exhibits attached hereto, as per Index following, you will find a large amount of the data and some of the calculations through which I have arrived at the above conclusions.

Respectfully submitted,

HENRY I. LEA.

H. I. L.—M. S.
